The experiments described in this report were designed to study the effects of certain acoustic cues on detectability of a delayed signal. The purpose was to gain insight into how the ear suppresses multiple hearings in a reverberant setting. Results of the experiments indicate that a signal, intended to simulate and echo, is more difficult to detect when it is following an identical masker, intended to simulate a primary sound, than when it is leading that masker. If, however, the signal is not acoustically similar to the masker, this asymmetry disappears, even if the masker is equally effective in the simultaneous condition. Further, if the signal and masker are not identical, but share an important acoustic attribute such as harmonicity, the asymmetry is observed. In summary, detectability of the delayed signal seems to be dependent on the strength of acoustic connection between the signal and masker, whereas detectability of the leading signal does not demonstrate that dependence. INFORMATION THEORY FOR ARM VISUO-MOTOR COORDINATION Ph.D. Thesis
Tarcisio Passos Ribe deCampos 1993 166 p
Avail: Univ. Microfilms Order No. DA9328987

The present work addresses the information processing of visuo-motor coordination. The aim of this research is to develop an adaptive model for coordinating mechanical action of an arm according to visual information. As a result, a large neural map has been generated which has been used to guide a pneumatically driven robot arm through a vision system consisting of image boards and two stereo cameras. This engineering approach has been employed to test the algorithm which might share close features with the way that biological beings solve the same sensory-motor task. Basically, arm postures are represented through their projections onto a set of image planes. Based on the link orientations and lengths as visual primitives extracted from these images, a topological state-space is characterized. Arm kinematics is defined as transformations of topological hypersurfaces, the intersections of which represent all possible postures which any redundant arm possesses in reaching an arbitrary target position. The self-organizing feature map has learned how the topological hypersurfaces transform in the state-space during arbitrary movements of the arm. The analyses of these transformations helped in idealizing a connectionistic model for kinematics. A model for the collision-free motion of a redundant arm manipulator moving in a workspace with obstacles is presented. A mapping of the arm surface onto a set of lattices, in which visual, motor information, and surface location are encoded, is adaptively developed through a learning procedure fed by trial movements. The map, which carries topographical features of the arm surface, is then used to guide the arm avoiding collisions with obstacles in unpredictable positions. The main achievements of this research are the topographical neural model for

obstacle-avoidance and the connectionist model for kinematics for redundant arms. Both models have been developed based on the analyses of a dynamic geometry, induced by the arm movements, embedded in a denoted visuo-motor space. The topographical neural model presents similar features with the motor cortex which might provide some insight for understanding biological visuo-motor control. Dissert. Abstr.

MECHANISMS OF TEMPORAL PATTERN DISCRIMINATION BY HUMAN OBSERVERS Final Technical Report, 1 Oct. 1990 - 31 Dec. 1993
Robert D. Sorkin 15 Feb. 1994 157 p
(Grant AF-AFOSR-0065-91)
(AD-A277407; AFOSR-94-0129TR) Avail: CASI HC A08/MF A02

The project's first component studied how human listeners discriminate two temporal patterns of tones. The stimuli were non-speech, non-musical tone sequences that conveyed arhythmic or partly rhythmic time patterns. The results indicated that the temporal pattern discrimination process depends on the timing of the sequences and whether they overlap in time. Listeners can perform the task very well when the patterns do not overlap and are presented to separate ears and/or at different tone frequencies. At long time separations, the listener's discrimination mechanism reduces the input information to two lists of intertone times, and the decision is based on the correlation between the lists (a temporal correlation process). At short time separations, the mechanism computes statistics based on the summed envelope of the two input waveforms (a single channel process). The project's second component consisted of analytical and computer modeling of multi-element detection systems. New results were obtained on the performance of statistically optimal detector arrays and on arrays that combine their binary outputs. The project's third component studied how observers process information in multi-element, visual signal detection. The results describe how performance depends on display element reliability, coding, and arrangement. DTIC

READING: INTERACTION WITH MEMORY Final Report, 1 Mar. 1990 - 31 Aug. 1993
Gail McKoon 15 Dec. 1993 170 p
(Grant AF-AFOSR-0246-90)
(AD-A277547; AFOSR-94-0097TR) Avail: CASI HC A08/MF A02

The topic of the supported research was reading and the ways information in memory can contribute to the inference processes that occur during reading. One source of information for inference processes is short-term memory for parts of a text that have already been read. Experiments investigated how this information is made available to allow, for example, inferences that decide the correct referent of a pronoun, or inferences that relate via causality two events described by the text. Experiments also examined the local representation constructed for a text, testing our proposal that locally available information is structured by the linguistic, semantic, and pragmatic means by which the information is expressed. A second line of research examined interactions between inference processes and well-known information from long-term memory, examining knowledge of the semantic structures of verbs, knowledge of what concepts are frequently associated with each other, and knowledge about how lexical items are used in various contexts. REMINDING-BASED LEARNING Annual Technical Report, 21 Jan. 1993 - 20 Jan. 1994
Brian H. Ross 8 Feb. 1994 12 p
(Grant AF-AFOSR-0447-89)
(AD-A277424; AFOSR-94-0126TR) Avail: CASI HC A03/MF A01

When learning new cognitive skills involving problem solving, novices are often reminded of earlier problems. The use of earlier problems is a common means of problem solving and affects the learning of the skill. This project has three aims in understanding this learning. First, the representation of the resulting generalizations is being examined. Generalizations formed from remindings are likely to be conservative, in that they may be more tied to the examples than many current theories allow. A main aim of the project is to distinguish and test different forms of this conservatism. Second, the development of problem solving expertise is examined by focusing on differences in how typical and atypical problems are solved. Third, the effects of such reminding-based learning in everyday problem solving is examined to extend the findings and test some theoretical ideas that are difficult to investigate in more formal domains. This report provides an overview of this work and the progress on these objectives during the last year. DTIC

VISUAL PROCESSING OF OBJECT VELOCITY AND ACCELERATION Annual Technical Report, 16 Jan. 1993 - 15 Jan. 1994
Suzanne McKee 4 Feb. 1994 3 p
(Contract F49620-92-J-0156)
(AD-A277425; AFOSR-94-0102TR) Avail: CASI HC A01/MF A01

Human observers can easily detect a signal dot moving, in apparent motion, on a trajectory embedded in a background of random-direction motion noise. A high detection rate is possible even though the spatial and temporal characteristics (step size and frame rate) of the signal are identical to the noise, making the signal indistinguishable from the noise on the basis of a single pair of frames. The success rate for detecting the signal dot was as high as 90% when the probability of mismatch from frame-to-frame, based on nearest neighbor matching was 0.3, control experiments showed that trajectory detection is not based on detecting a 'string' of collinear dots, i.e., a stationary position cue. Nor is a trajectory detected because produces stronger signals in independent 'local' motion detectors. For one thing, trajectory detection improves with increases in duration, up to 250-400 msec, a duration longer than the integration typically associated with a single motion detector. Moreover, the signal dot need not travel in a straight line to be detectable. The signal dot was as reliably detected when it changed its direction a small amount (less than 30 deg) each frame. Consistent with this, circular paths of sufficiently low curvature were as detectable as straight trajectories. DTIC

INVESTIGATION OF DRIVE-REINFORCEMENT LEARNING AND APPLICATION OF LEARNING TO FLIGHT CONTROL Final Report, 1 Jan. 1989 - 1 Aug. 1993
Walter L. Baker, Stephen C. Atkins, Leemon C. Baird, III, Mark A. Koenig, and Peter J. Millington Aug. 1993 503 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F33615-88-C-1740)
(AD-A277442; CSDL-R-2575; WL-TR-93-1153) Avail: CASI HC A22

This report describes results obtained during a multiphase research program having the broad aim of investigating the application of learning systems to automatic control in general and to flight control in particular. The first phase analyzed the drive-reinforcement learning paradigm and examined its application to automatic control, with mixed results. The second phase compared a number of alternative strategies for learning augmented control and resulted in the conception of a new hybrid adaptive/learning control scheme. Subsequently, in the third phase, this hybrid control approach was more fully developed and applied to several nonlinear dynamical systems, including a cart-pole system, aeroelastic oscillator, and a three degree of freedom aircraft. The fourth phase revisited drive-reinforcement learning from the point of view of optimal control and successfully applied a version embedded in the associative control process architecture to regulate an aeroelastic oscillator. The fifth phase examined the problem of learning augmented estimation and resulted in the development of a preliminary estimation scheme consistent with the hybrid control approach. In the sixth and final phase, the hybrid control methodology was applied to a nonlinear, six degree of freedom flight control problem and then demonstrated via a challenging multiaxis maneuver. DTIC

AUTOGENIC-FEEDBACK TRAINING AS A TREATMENT FOR AIRSICKNESS IN HIGH-PERFORMANCE MILITARY AIRCRAFT: TWO CASE STUDIES
Patricia S. Cowings, William B. Toscano, Neal E. Miller, and Samuel Reynoso Mar. 1994 22 p
(RTOP 199-70-12-14)
(NASA-TM-108810; A-94048; NAS 1.15:108810) Avail: CASI HC A03/MF A01

The purpose of this paper is to present a detailed description of the physiological and performance responses of two military pilots undergoing

a treatment for motion sickness. The treatment used, Autogenic-Feedback Training (AFT), is an operant conditioning procedure where subjects are taught to control several of their autonomic responses and thereby suppress their motion sickness symptoms. Two male, active duty military pilots (U.S. Navy and U. S. Marine Corps), ages 30 and 35, were each given twelve 30-minute training sessions. The primary criterion for success of training was the subject's ability to tolerate rotating chair motion sickness tests for progressively longer periods of time and at higher rotational velocities. A standardized diagnostic scale was used during motion sickness to assess changes in the subject's perceived malaise. Physiological data were obtained from one pilot during tactical maneuvers in an F-18 aircraft after completion of his training. A significant increase in tolerance to laboratory-induced motion sickness tests and a reduction in autonomic nervous system (ANS) response variability was observed for both subjects after training. Both pilots were successful in applying AFT for controlling their airsickness during subsequent qualification tests on F-18 and T-38 aircraft and were returned to active duty flight status. Author

(AD-A277427; AFOSR-94-0071TR) Avail: CASI HC A02

This project provided partial support for an international conference on the simulation of adaptive behavior. The conference was held in Honolulu, HI on December 7-11, 1992. It was attended by more than 100 scientists from the US, Europe, and Asia. The main topic of the conference was how to use theories of animal behavior as a guide in the construction of robots and other autonomous agents. Contributors discussed how to develop behavior-based artificial intelligence, perception and motor control, action selection and the structuring of behavioral sequences, cognitive maps and internal world models, learning, evolution and adaptation, and collective behavior. The workshop brought together researchers in computational vision and psychophysics to discuss ways of conceptualizing and modeling problems in visual perception. Such a conceptualization requires common frameworks for formulating problems in perception. Workshop participants considered what formal tools and structures these frameworks should provide in order to be most useful for the study of human vision. Several recently proposed frameworks based on the formulation of Bayesian, probabilistic inference served as the focal point for evaluation and discussion. DTIC

The overall goal of the 'University Initiative' project 'Neostriatal Neuronal Activity and Behavior' was to establish a new technical approach for the study of ensembles of single neurons in CNS during tasks requiring sensory motor integration. An aim was to establish methodology for chronic implant of arrays of recording electrodes in rat neostriatum and other regions. Instrumentation was to be developed to allow amplification and spike sorting to be done for up to 64 concurrent spike trains. An acquisition system was to record the time events of spike trains, stimuli, and behavior events for up to four days continuously. An analysis capability was to provide a wide range of standard analysis procedures including histograms and rasters. A new approach for neuron ensemble analysis was to be developed to deal with statistical fluctuations of ensemble patterned activity across trials. Experimental studies were to study neuronal population activity during a series of tasks including tone and treadmill locomoting and a delayed matching-to-sample task with a spatial memory requirement. Computational simulation was to be done to explore short-term memory properties of the local circuitry between medium spiny neurons in neostriatum. Development of the experimental approach was the primary goal. Extended experimental analysis was secondary for this type of developmental project. DTIC

A REVIEW OF MICROCLIMATE COOLING SYSTEMS IN THE CHEMICAL, BIOLOGICAL, RADIOLOGICAL ENVIRONMENT
T. Derion and R. S. Pozos 22 Sep. 1993 29 p
(NR Proj. M33-P-30)
(AD-A276446; NHRC-93-23) Avail: CASI HC A03/MF A01

Soldiers may work in hot environments and under conditions posing a biological, chemical, or nuclear threat. Chemical protective overgarments

are worn to prevent contact with toxins; however, they prevent dissipation of body heat. This review addresses the effectiveness of microclimate cooling systems in alleviating thermal strain in personnel encapsulated in protective overgarments during exertion in the heat. Air, liquid, and passive ice cooling systems are primarily reviewed, but other methodologies are also discussed. Air cooling can increase tolerance time fourfold, but high ambient temperature air cooling may be dangerous. Liquid cooling is effective in reducing heat strain at light to moderate work loads and is beneficial when applied to the thighs during lower-body exercise. Overcooling and discomfort can occur with a liquid-cooled system due to cutaneous vasoconstriction. Liquid-cooled systems are heavy and require excessive maintenance, and tube compression can result in interrupted coolant flow. Air cooling is inefficient compared to liquid cooling because of air's lower specific heat. Ice cooling may only be suitable for short-term work and is generally less effective than either air or liquid cooling although the wearer can move about untethered. The best cooling system design approach may be indicated by consideration of the unique cooling needs of personnel performing specific tasks in various environments. DTIC

NASA has been progressively learning the design and performance of the Russian life support systems utilized in their Mir space station. In 1992, a plan was implemented to assess the benefits of the Mir-1 life support systems to the Freedom program. Three primary tasks focused on: evaluating the operational Mir-1 support technologies and understanding if specific Russian systems could be directly utilized on the American space station and if Russian technology design information could prove useful in improving the current design of the planned American life support equipment; evaluating the ongoing Russian life support technology development activities to determine areas of potential long-term application to the U.S. space station; and utilizing the expertise of their space station life support systems to evaluate the benefits to the current U.S. space station program which included the integration of the Russian Mir-1 designs with the U.S. designs to support a crew of six. DIGIT-EYES: VISION-BASED HUMAN HAND TRACKING

James M. Rehg and Takeo Kanade 31 Dec. 1993 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Grant NGT-50559)

(NASA-CR-195913; NAS 1.26:195913; AD-A276417; CMU-CS-93-220) Avail: CASI HC A03

Passive sensing of human hand and limb motion is important for a wide range of applications from human-computer interaction to athletic performance measurement. High degree of freedom articulated mechanisms like the human hand are difficult to track because of their large state space and complex image appearance. This article describes a model-based hand tracking system, called Digit-Eyes, that can recover the state of a 27 degree of freedom hand model from gray scale images at speeds of up to 10 Hz. We employ kinematic and geometric hand models, along with a high temporal sampling rate, to decompose global image patterns into incremental, local motions of simple shapes. Hand pose and joint angles are estimated from line and point features extracted from images of unmarked, unadorned hands, taken from one or more viewpoints. We present some preliminary. results on a three dimensional mouse interface based on the Digit-Eyes sensor. DTIC

DESIGN OF A LOGISTICS MODEL FOR BUILDING AND SUPPORTING A LUNAR STATION [ENTWURF EINES LOGISTIK-MODELLS FUER DEN BAU UND DEN BETRIEB EINER MONDSTATION]

Richard Huhn 1 May 1993 85 p In GERMAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ILR-Mitt-282(1993); ETN-94-95744) Avail: CASI HC A05

A simulation model that allows five transportation systems for logistic support of a lunar base to be compared on the basis of their cost effectiveness is presented. Over a life cycle of 50 years, four different growth rates of the lunar base were considered. The annual average size of the scientific staff and the annual lunar output were given as input data of this model. Taking into account the increasing annual lunar output and the required propellants per year for the transportation system, the annual volume of imports, the annual number of launches, the average costs per year, and the cost effectiveness were calculated. This simulation model consists of about 65 equations. To check the plausibility of the calculated trends, the results of a standard run are presented. ESA

TRIPPING OVER OBSTACLES: BIOMECHANICAL ANALYSES OF HOW YOUNG AND OLD TRY TO AVOID IT Ph.D. Thesis

Hsieh-Ching Chen 1993 135 p

Avail: Univ. Microfilms Order No. DA9319500

The objective of this research was to determine the biomechanical factors that significantly affect gait patterns, planning, motor control, and fall avoidance strategies required to successfully negotiate obstacles. The results of this research are presented as a series of three experimental studies and a biomechanical model simulation study. In the first study, the gait patterns of healthy young and old adults were examined as they approached and stepped over fixed obstacles of different heights. The results suggest that the old adults adopt a more conservative strategy for crossing obstacles than young adults. The second study examined the effectiveness of avoidance strategies used by young and old healthy adults as they walked and stepped over a virtual obstacle that appeared from 200 to approximately 1000 ms before reaching it. The results suggested that delays as small as 50 or 100 ms in noticing or reacting to obstacles may significantly lower subjects' rates of success in avoiding them. Age group differences were found, but they were not pronounced. The third study examined the effect of divided attention in young and old healthy adults as they walked and stepped over an obstacle under time-critical conditions. The results showed attention distraction significantly decreased subjects' ability to avoid obstacles under time critical conditions. The old had a significantly higher risk of obstacle contact than the young under these conditions. In the final study, two different biomechanical models were used to simulate the response to a trip. A phase 1 model predicted body kinematics and dynamics from swing foot toe-off until 100 ms after contact of the swing foot with the obstacle. The phase 2 model predicted the recovery response from 100 ms after obstacle contact until the swing foot was extended forward and recontacted the ground or for 200 ms if recontact had not occurred by that time. The results showed the maximum available rate of torque development in the swing hip flexor and the stance leg ankle plantaflexor muscles may largely determine the ability to recover from a trip. BEYOND THE READ-EVAL LOOP: THE ARTIFACTS SYSTEM

Mike Karr 14 Feb. 1994 19 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contracts N00014-85-C-0710; N00014-90-C-0024)
(AD-A276589) Avail: CASI HC A03

The purpose of the Artifacts System is to structure complex, evolving data, to assist users in their cooperative effort to develop such data, and to integrate the tools that operate on and produce this data. A key element in the design is to eliminate what is the usual interaction with a computer-based system: run a tool to achieve a desired effect. Rather, users of the Artifacts System set up structures that indicate desired results and browse these structures in hypertext-like fashion; tool invocation is usually implicit. Version and configuration management is an integral part of the system, not a facility on the side. DTIC

EVALUATION OF INTENSITY DISTRIBUTION PROFILES FOR US. ARMY ROTORCRAFT POSITION LIGHTING ADAPTED FOR IMAGE INTENSIFIER OPERATIONS Final Report
Ellen H. Snook, Clarence E. Rash, and Malcolm N. Colbert Sep. 1993 175 p
(DA Proj. 3M1-62787-A-879)
(AD-A276459; USAARL-93-36) Avail: CASI HC A08/MF A02

Compatibility problems with image intensifier (I2) devices and cockpit/interior lighting have been investigated and well documented. However, I2 compatibility with position/exterior lighting is only in the early stages of development. In the Army aviation community, attempts have been made to reduce the detrimental effects of position light intensity on I2 devices by operating lights in dim mode or by masking lights. In these modified lighting configurations, requirements in Federal Aviation Administration (FAA) regulations are not always satisfied. In this investigation, the intensity distribution profiles for currently employed lighting strategies were evaluated. Further subjective evaluation of the entire position light system, as a whole, is strongly recommended in order to determine all factors that may have impact on the modification of exterior lighting and/or requirements. Exterior lighting must be acceptable in both the civilian/military aviation environments. DTIC

METHODS FOR MEASURING CHARACTERISTICS OF NIGHT VISION GOGGLES Final Report, Mar. 1989 - Nov. 1991
Harry L. Task, Richard T. Hartman, Peter L. Marasco, and Annette R. Zobel Oct. 1993 55 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AF Proj. 7184)
(AD-A277046; AL/CF-TR-1993-0177) Avail: CASI HC A04

There are many parameters that are used to describe and specify night vision goggles (NVG's) such as resolution, field of view, brightness gain, distortion, etc. However, standardized test procedures for determining the value of these parameters have not been established. Informal comparison studies have shown that measurements of some of these parameters may vary considerably (as much as a factor of two) depending on the method, equipment, and procedures used to make the measurements. The purpose of this technical report is to document specific procedures for measuring most of the major parameters used to specify NVG's to help standardize methodology and improve accuracy and comparability between measuring organizations. UNIT SPECIFIC CREW REST STRATEGIES: PHASE 1 EVALUATION OF THE 1/212TH AVIATION BATTALION DURING SHIFTWORK TRANSITIONS Final Report
Carlos A. Comperatore, James A. Chiaramonte, Kathy L. Lawhorn, and Lawrence W. Allan Jan. 1994 51 p
(DA Proj. 3M1-62787-A-879)
(AD-A277122; USAARL-94-3) Avail: CASI HC A04/MF A01

Army aviation commanders are deeply concerned with the implementation of crew rest strategies which are both practical and effective. Maintaining peak performance of individuals rotating from one work shift to another is of paramount concern. General guidelines often provide appropriate information, but they do not provide strategies or specific schedules of crew rest tailored to the unit's specific mission demands, environmental conditions, and strength. A complement to general recommendations and guidelines is the use of unit-specific crew rest strategies. This concept involves a two-phase process. In phase one, the unit's existing response to a characteristic mission or training exercise is evaluated by determining the amount of rest obtained by a representative sample of crew members. The results of the phase 1 evaluations provide descriptive quantitative information of daily rest periods, and the impact of mission driven work schedules and environmental conditions on crew rest quality. Phase 2 provides rhythms, sleep/wake cycles, shiftwork schedules, and methods for regulating the body's biological clock to prevent sleep loss during characteristic mission. This report contains a summation of the results of a phase 1 evaluation of shiftwork schedules used by the 1/212th Army Aviation Training Battalion at Fort Rucker, Alabama. Shiftwork schedules used by 1/212th aviators and aircrew included shifts from daytime to early morning, to nighttime, and to afternoon duty hours. DTIC

NOVEL ULTRASONIC METHOD FOR FOOD HYDRATION Final Report, Mar. - Oct. 1993
S. R. Taylor and J. C. Hansen Mar. 1994 33 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DAAK60-93-C-0020)
(AD-A277411; Natick-TR-94/014) Avail: CASI HC A03

This report summarizes the work accomplished in the successful completion of phase 1 of this SBIR project. The overall conclusion is that the ultrasonic activation during aerosol dehydration results in significant increases in evaporation/dehydration rates. These improvements in dehydration rates allow for much more rapid and energy-efficient processing, thus reducing dehydration costs. DTIC

THE ROLE OF GUIDELINE-BASED DESIGN TOOLS
J. A. Fox Oct. 1993 6 p Presented at the Human Factors and Ergonomics Society Meeting, Seattle, WA, 11-15 Oct. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC06-76RL-01830)
(DE94-007482; PNL-SA-21969; CONF-9310100-8) Avail: CASI HC A02

User System Interface (USI) design guidelines are one of the more popular tools that have been developed to aid designers in creating effective interfaces. When used properly, guidelines can provide the basis for a structured design methodology throughout the system life cycle. A survey published by Mosier and Smith (1986) provides an in-depth account of guideline usage. That 1986 survey showed that guidelines were used in varying degrees by virtually all types of people involved in the design and evaluation of USIs. Design guidelines are one of the older USI design tools, and the continued popularity of guidelines can be seen by the continued updating and expansion of guideline compendiums to keep up with new advances in the field. CATALYTIC METHODS USING MOLECULAR OXYGEN FOR TREATMENT OF PMMS AND ECLSS WASTE STREAMS, VOLUME 2 Final Report, Apr. 1990 - Apr. 1992
James R. Akse 12 May 1992 217 p
(Contract NAS8-38490; SBIR-12.02-5201(Vol-2))
(NASA-CR-190299; NAS 1.26:190299) Avail: CASI HC A10/MF A03

Catalytic oxidation has proven to be an effective addition to the baseline sorption, ion exchange water reclamation technology which will be used

on Space Station Freedom (SSF). Low molecular weight, polar organics such as alcohols, aldehydes, ketones, amides, and thiocarbamides which are poorly removed by the baseline multifiltration (MF) technology can be oxidized to carbon dioxide at low temperature (121 C). The catalytic oxidation process by itself can reduce the Total Organic Carbon (TOC) to below 500 ppb for solutions designed to model these waste waters. Individual challenges by selected contaminants have shown only moderate selectivity towards particular organic species. The combined technology is applicable to the more complex waste water generated in the Process Materials Management System (PMMS) and Environmental Control and Life Support System (ECLSS) aboard SSF. During the phase 3 Core Module Integrated Facility (CMIF) water recovery tests at NASA MSFC, real hygiene waste water and humidity condensate were processed to meet potable specifications by the combined technology. A kinetic study of catalytic oxidation demonstrates that the Langmuir-Hinshelwood rate equation for heterogeneous catalysts accurately represent the kinetic behavior. From this relationship, activation energy and rate constants for acetone were determined. Author (revised)

AN INVESTIGATION OF ACOUSTIC NOISE REQUIREMENTS FOR THE SPACE STATION CENTRIFUGE FACILITY
Timothy Castellano Feb. 1994 28 p
(RTOP 960-60-90)
(NASA-TM-108811; A-94050; NAS 1.15:108811) Avail: CASI HC A03/MF A01

Acoustic noise emissions from the Space Station Freedom (SSF) centrifuge facility hardware represent a potential technical and programmatic risk to the project. The SSF program requires that no payload exceed a Noise Criterion 40 (NC-40) noise contour in any octave band between 63 Hz and 8 kHz as measured 2 feet from the equipment item. Past experience with life science experiment hardware indicates that this requirement will be difficult to meet. The crew has found noise levels on Spacelab flights to be unacceptably high. Many past Ames Spacelab life science payloads have required waivers because of excessive noise. The objectives of this study were (1) to develop an understanding of acoustic measurement theory, instruments, and technique, and (2) to characterize the noise emission of analogous Facility components and previously flown flight hardware. Test results from existing hardware were reviewed and analyzed. Measurements of the spectral and intensity characteristics of fans and other rotating machinery were performed. The literature was reviewed and contacts were made with NASA and industry organizations concerned with or performing research on noise control. Author

USE OF A PITCH ADJUSTABLE FOOT RESTRAINT SYSTEM: OPERATOR STRENGTH CAPABILITY AND LOAD REQUIREMENTS
Robert P. Wilmington (Lockheed Engineering and Sciences Co., Houston, TX.), Jeffrey Poliner (Lockheed Engineering and Sciences Co., Houston, TX.), and Glenn K. Klute May 1994 33 p
(Contract NAS9-18800)
(NASA-TP-3477; S-764; NAS 1.60:3477) Avail: CASI HC A03/MF A01

The zero-gravity environment creates a need for a proper human body restraint system to maintain a comfortable posture with less fatigue and to maximize productivity. In addition, restraint systems must be able to meet the loading demands of maintenance and assembly tasks performed on orbit. The shuttle's primary intravehicular astronaut restraint system is currently a foot loop design that attaches to flat surfaces on the shuttle, allowing for varying mounting locations and easy egress and ingress. However, this design does not allow for elevation, pitch, or foot loop length adjustment. Several prototype foot restraint systems are being evaluated for use aboard the space station and the space shuttle. The JSC Anthropometry and Biomechanics Laboratory initiated this study to quantify the maximum axial forces and moments that would be induced on a foot loop type of restraint while operators performed a torque wrench task, also allowing for angling the restraint pitch angle to study yet another effect. Results indicate that the greatest forces into the torque wrench and into the foot restraint system occur while the operator performs an upward effort. This study did not see any significant difference in the operators' force due to pitch orientation. Thus, in a work environment in which hand holds are available, no significant influence of the pitch angle on forces imparted to the restraint system existed. Author (revised)

EFFECTS OF COMBINED BREATHING IMPEDIMENTS ON DIVER'S RESPIRATORY PERFORMANCE Annual Progress Report, 1 Feb. 1993 - 31 Jan. 1994
Claes Lundgren 31 Jan. 1994 9 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-93-1-0509)
(AD-A277437) Avail: CASI HC A02

Combinations of flow resistance (R), elastance (E) and static lung loading are present to varying degrees in all breathing gear for divers. We have, in earlier studies, determined the maximal acceptable levels for two of these loads, when acting alone, to be: E: 7 cm H20/L, R: such that the external work of breathing equals 1.5 to 2.0 J/L. Fractions of the acceptable levels of R and E (when acting alone) were combined such that the total fraction was 1. The subjects were exposed to five of these combinations (%R/%E): 100/0, 75/25, 50/50, 25/75, 0/100. No static lung load was imposed. Results are from 3, in an ongoing series of 12, submerged, air-breathing divers exposed in a hyperbaric chamber to 1.45 and 6.8 ATA; exercise was performed in the prone position at 60% of VO(2). The mean end-tidal CO2 values were 46.7 mm Hg at the shallow depth and 52.4 mm Hg at the great depth but were unaffected by the R/E combination. V(E) was not affected differently by the R/E combinations, but the tidal volumes were reduced 8-20% by increased E. The ERV was reduced by about 20% with the higher E. Similarly, the VC was reduced by about 15%. The T(sub i)/T(sub tot) was not affected by the R/E combinations but it increased from 0.45 to 0.47 with depth. The dyspnea scores were not different for the different loads. This leads to the conclusion that R and E are additive in their effects on divers' respiratory performance. DTIC

AN EXPERIMENTAL STUDY OF PILOT/VEHICLE DYNAMICS USING A TILT ROTOR FLYING MACHINE Final Report, May 1992 - Jun. 1993
David B. Doman Jun. 1993 291 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A277516; WL-TR-93-3063) Avail: CASI HC A13

A laboratory Tilt Rotor Flying Machine (TROFM) is designed and built for the purpose of conducting an experimental study of the effects of command systems on human pilot behavior. The aircraft is mounted on a two-axis pivot stand which gives the fuselage 2 degrees of freedom; pitch and yaw. Analytical models are derived using Lagrangian and Newtonian techniques. Identification of the aircraft characteristics is based on a nonparametric Discrete Fourier Transform technique and a maximum likelihood parameter estimation scheme. Attitude command, rate command and unaugmented systems are designed and implemented in real time using a digital computer. An investigation of the effects of command systems, displays and tasks on human pilot behavior is conducted. Pilot and pilot-vehicle describing functions are obtained from time histories of dynamic tracking tasks where the pilot attempts to track a random appearing input. Correlations between Cooper-Harper ratings and quantitative descriptions of pilot behavior are made. The experimental results compare favorably to

the classical theory of man-machine system dynamics which is based on the cross-over model. The results of this study indicate that desirable controlled elements in man-machine systems have the characteristics of a simple tracker. DTIC

(PB94-148251) Avail: CASI HC A07

The thesis describes a novel, extremely fast and cost effective special-purpose computer for performing simulations of Ising and Ising-like models: the Delft Ising Computing Engine (DICE). DICE lifts the ceiling of the computational power available to a physicist for the type of simulations for which it has been designed. DICE is a parallel and fully pipelined computer that consists of a linear array of tightly-coupled identifical processors driven by a single controller. It serves as a coprocessor to a Silicon Graphics UNIX host. Except for the host interface, the machine operates synchronously at a clock speed of 20 MHz. DICE is extendible by means of auxiliary processors for particularly nasty measurements. The hardware peculiarities of DICE are hidden from its users. They see a high-level programmable virtual machine created by software running on the host. This virtual machine uses a database in which all the parameters relevant to a simulation are stored, and automatically generates the information required by DICE. NTIS

AN ANALYSIS OF INSTRUCTION-CACHED SIMD COMPUTER ARCHITECTURE Ph.D. Thesis
Todd E. Rockoff Dec. 1993 247 p
(Contract F33615-90-C-1465; ARPA Order 7597)
(AD-A276519; CMU-CS-93-218) Avail: CASI HC A11/MF A03

In a single instruction-stream/multiple data-stream (SIMD) computer, calculations are performed by simple processing elements (PE's) that are not independently capable of program-control operations. In lock-step, the PE's execute one program that is sequenced by a single system controller. Large numbers of these simple PE's are obtained through replication of a PE chip containing many identical PE's. A state-of-the-art SIMD computer is regulated by a single system clock that is distributed throughout the

computer. On each system clock cycle, the system controller broadcasts the next instruction to be executed by the PE's. The system clock interval allows time to distribute a PE instruction throughout the computer, an action that typically requires more time than the minimum interval of a clock regulating the PE's themselves within the PE chips. The disparity between the highest rate of PE operation and the rate of global instruction broadcast gives rise to a heretofore uncompensated clock-rate limitation. To overcome this limitation, instruction-cached SIMD computer architecture provides for a small instruction buffer to be placed within the replicated PE chip. This buffer stores repeated instruction sequences for subsequent retrieval at the relatively high rate attainable within the PE chip. The instruction buffer and its control mechanism comprise a SIMD instruction cache, or 1-cache. DTIC

DOME: DYNAMIC OPTIMIZATION ON MULTIPROCESSOR ENGINES, A STATISTICAL APPROACH Ph.D. Thesis
Fotios N. Barlos 1993 192 p
Avail: Univ. Microfilms Order No. DA9316548

To efficiently handle a continuous increase in the volume of information, elaborate multicomputer database machines and sophisticated software tools are employed. Maximum exploitation of parallelism dictates an even partitioning of the computation across the processing sites. To achieve a uniform load is difficult when the data are highly skewed since characterizing the expected workload can introduce significant overhead. We develop a query optimization approach, named Dynamic Optimization on Multiprocessor Engines (DOME), that uses a dynamic sampling methodology to determine the frequency distribution along each level of the query tree. DOME covers the three main multiprocessor query optimization areas of Workload Partitioning, Site Selection, and Operation Ordering. The DOME optimizer samples the input relations of a query tree and subsequently performs the computation of the query on the samples to generate the intermediate results of the tree. Contrary to previous static optimizers that use analytical formulas to estimate the frequency distribution of the relations at higher levels of the query tree DOME derives the required frequency distribution by analyzing the characteristics of the developed sampled relations. We prove that the application of the same relational operation on relations and their samples produces relations with the same statistical characteristics. We implemented DOME on an Intel i860 hypercube system with 32 nodes and test its behavior through extensive experimentation. DOME provides uniform workload distribution across all the tests. The Workload Partitioning algorithms yields an order of magnitude factor improvement over prior approaches for highly skewed data during Project-Join execution sequences. The Site Selection algorithms provide approximately a six fold factor improvement over a static allocation approach for Join operation. The Operation Ordering approach provides approximately a 20 percent improvement over a random resolver for Three-Way Join operations with a sample size of 10 percent of the input relation. Overall, DOME provides savings across the whole domain of the input datasets, and the savings become significant as the skewness of the input relations grows.

MICA, A FACILITY TO ACHIEVE PORTABILITY FOR MESSAGE-PASSING AND DYNAMIC MEMORY MANAGEMENT IN FORTRAN
J. C. Brown and A. A. Mirin Jan. 1994 14 p
(Contract W-7405-eng-48)
(DE94-006692; UCRL-ID-115975) Avail: CASI HC A03/MF A01

MICA, which stands for Macro Interface for Communication and Allocation, is a macro facility for message passing and dynamic memory management for Fortran programs on Unix platforms. A combination of CPP and M4 preprocessing is used to provide the macro interface. CPP is used for conditional compilation according to machine architecture and selected memory management and message passing options. M4 is used for translating the macro calls into the appropriate Fortran code sequences. Several supporting Fortran subprograms are included. DOE

AN ANALOG PREPROCESSING ARCHITECTURE FOR HIGH-SPEED ANALOG-TO-DIGITAL CONVERSION M.S. Thesis
Jorge A. Esparza Dec. 1993 168 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A276737) Avail: CASI HC A08

This thesis investigates the feasibility of implementing an analog-to-digital converter (ADC) based on a new symmetrical number system (SNS). This preprocessing architecture decomposes the analog amplitude analyzing function of an ADC into a number of sub-operations (moduli). Each sub-operation folds the analog signal with a folding period proportional to the value of the modulus. Through the use of the SNS encoding and recombining the results of the sub-operations, a definitive performance enhancement is achieved. The number of comparators required is reduced considerably, allowing more bandwidth to be used in the folding circuits. The overall design effort demonstrates a 9-bit design with a total of 23 comparators. SPICE simulations are developed and the performance demonstrated. Also identified are the areas in which further research is required. DTIC

MULTIMEDIA AS A DESKTOP AND CLASSROOM TOOL
S. Nelson Feb. 1994 11 p
(Contract DE-AC04-94AL-85000)
(DE94-009118; SAND-94-0249) Avail: CASI HC A03/MF A01

The major thrust of the study leading to this report was a quick but in-depth understanding of the process for using multimedia computer equipment for information exchange within our engineering office and within the school environment. That is, how feasible is it to augment the typical office memo or school instruction sheet with pictures, video, and sounds? What specialized skills, hardware, and software are needed by those of us who want to use the technology? The brief study period allowed for an examination of available hardware and software, observation of current approaches to multimedia within our particular environment, and the development of applications, all within the context of several project areas: the Sandia Science Advisors program; a Sandia scientific project associated with the National Information Infrastructure Testbed; the curriculum of Monte Vista Elementary School of Albuquerque public schools; and the University of New Mexico Medical School health scene project. A MINIATURIZED ASIC-BASED MULTICHANNEL SCALER INSTRUMENT
M. N. Ericson, G. W. Turner, D. E. McMillan, B. S. Hoffheins, R. A. Todd, and J. M. Hiller 1993 5 p Presented at the 1993 IEEE Nuclear Science Symposium and Medical Imaging Conference, San Francisco, CA, 2-5 Nov. 1993
(Contract DE-AC05-84OR-21400)
(DE94-007222; CONF-931107-34) Avail: CASI HC A01/MF A01

A miniaturized multichannel scaler instrument was developed to address size and operational constraints for data acquisition in a portable laser-induced luminescence system. The multichannel scaling (MCS) function is implemented as a programmable application specific integrated circuit (ASIC) with standard interfaces for control and data acquisition. The instrument is microcontroller-based with sufficient computing power for data manipulation and algorithmic processing. The unit includes electronics for laser control and amplification and pulse height discrimination of PMT pulses. Modification of the instrument should allow use in nuclear, chemical, and spectroscopy related applications including Mossbauer experiments. Interfaces are incorporated allowing both computer-controlled and stand alone operation. Implementation of the MCS function as an ASIC and comparison with conventional implementations are discussed. Full characterization of the MCS is presented including differential non-linearity (DNL), bin dead time, and bandwidth measurements. DOE

TOROIDAL COMPUTER MEMORY FOR SERIAL AND PARALLEL PROCESSORS Patent
Allen D. Parks, inventor (to Navy) and James C. Perry, inventor (to Navy)
11 Jan. 1994 8 p Filed 29 Jun. 1990
(AD-D016144; US-Patent-5,278,966; US-Patent-Appl-SN-546595;
US-Patent-Class-395-425) Avail: US Patent and Trademark Office

The toroidal computer memory system utilizes toroidal memory paths in its architecture to enable memory locations along those paths to be obtained in a single access, as compared to multiple accesses typically required by

conventional linear computer memory. The storage/retrievable media is designed to replicate paths on the surface of a torus. By defining certain parameters and the mathematical properties of these memory paths in the electronics of a controller, points on the memory paths can be accessed from the storage/retrieval media more efficiently than conventional computer memory. Application specific integrated circuits (ASIC's) offer a number of advantages over traditional multi-component microcircuits including reductions in both size and power dissipation, and are therefore prime candidates to replace such microcircuits in space-borne electronics systems. The results of recent tests of the susceptibilities of various ASIC devices to cosmic ray and trapped proton induced single event upset (SEU) and latchup are reported here and are compared to the susceptibilities of the devices that they would replace. This comparison leads to a discussion of the impact of ASIC devices on the SEU susceptibility of space-borne computers. DTIC

SUMMARY OF SOME DATA PROCESSING ROUTINES IN THE MOLECULAR PHYSICS GROUP OF STOCKHOLM UNIVERSITY
Olli Launila and Jonas Jonsson Sep. 1993 116 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(USIP-93-05; ETN-94-95942) Avail: Issuing Activity (European Space Agency (ESA))

The development of computer based routines for analysis of molecular spectra is addressed. The goal in their development was to facilitate much of the 'trivial' work, like measuring plates, typing down data, constructing explicit models for different multiplicities, assessing raw data, etc. Different programs developed during the past years, as well as updates of older programs, are presented together with an outline of general organization of data transport and processing strategies. A rational data handling strategy is vital and should consist of simple data formats and programs capable of using these, preferably without ever having to specify to the program the data format in question. Therefore, the programs should be carefully constructed and 'intelligent', and the formats should be economic and easily readable. Also, the program source codes should be available to anyone who might want to modify and recompile them. It is hoped that this set of programs will facilitate much of the spectroscopy work. ESA

THE GENERALIZED MULTI DELAY ADAPTIVE FILTER: STRUCTURE AND CONVERGENCE ANALYSIS
E. Moulines, O. AitAmrane, and Y. Grenier 15 Mar. 1993 38 p Revised Sponsored by Centre National d'Etudes des Telecommunications Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0751-1345)
(TELECOM-93-D-004; ETN-94-95886) Avail: CASI HC A03

A view of frequency domain LMS algorithms as particular implementations of a more general scheme, the Generalized Multi Delay Filter (GMDF), is presented. Frequency domain adaptive filters have long been recognized as an attractive alternative to time domain algorithms when dealing with systems with large impulse response and/or correlated input. Frequency domain LMS adaptive schemes essentially retain the attractive features of frequency domain implementations, while requiring a processing delay considerably smaller than the length of the impulse response. Within this general class of algorithms, implementations based on the weighted overlap and add reconstruction algorithms are focused on; these variants provide an independent control of the overall processing delay and of the rate of update of the filter coefficients, allowing a tradeoff between the computational complexity and the rate of convergence. An analysis of the performance of this new scheme is presented and insight into the influence of impulse response segmentation on the behavior of the adaptive algorithm is provided. Exact analytical expressions for the steady state mean square error are derived. Necessary and sufficient conditions for the convergence of the algorithm to the optimal solution within finite variance are obtained, and translate into bounds for the stepsize parameter. Simulations are presented to support the analysis and to demonstrate the practical usefulness of the GMDF algorithm in applications where large impulse response have to be processed. ESA

A NEW METHODOLOGY OF SYSTEM PARAMETER ESTIMATION
J. T. Ma and Q. H. Wu Jan. 1994 16 p
(Maths-Rept-A-208; ETN-94-95868) Avail: CASI HC A03/MF A01

A new methodology of system parameter estimation based on the evolutionary programming (EP) to estimate the generator parameters is presented. The EP is very powerful for searching the real values of the parameters with measurements of generator outputs which are highly contaminated by noises, in contrast to the extended Kalman filter which is currently used for parameter estimation. Comparison between the two different methodologies is given to show the potential of applications of the EP to parameter estimation and system modeling. ESA

OPTIMAL REACTIVE POWER DISPATCH OF POWER SYSTEMS USING NONLINEAR PROGRAMMING
J. T. Ma and Q. H. Wu Jan. 1994 15 p
(Maths-Rept-A-209; ETN-94-95869) Avail: CASI HC A03/MF A01

The economical operation and planning of power systems using a nonlinear programming method is reported. The optimal reactive power dispatch of power systems with a number of constraints is solved by the BFGS (Broyden, Fletcher, Goldfarb, and Shanno) method to reduce transmission network power loss and improve voltage control of the transmission network. The simulation study is carried out based on the IEEE 30 bus system. The simulation results show that the BFGS method can be used with modifications to enhance the economical operation of power systems. ESA

DESIGN PATTERNS MIXING GENERICITY AND INHERITANCE IN THE DEVELOPMENT OF REUSABLE COMPONENTS
Piero Fraternali Jun. 1993 22 p

(Rept-93-021; ETN-94-95803) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

Genericity and inheritance are both considered helpful means in the design of well organized collections of software components, particularly as they foster the factorization of commonalities among modules and thus the production of more compact, yet extensible code. However, the availability of both primitives in a single programming language gives application designers more than one way to organize a system into a collection of modules. It is not always clear which solution is preferable under which respect. Genericity and inheritance have been contrasted, and some design guidelines are proposed, mainly in the context of software production in-the-small. Investigations on the role of inheritance and genericity in the design, maintenance, and reuse of collections of software components are reported. Results of a broad review of existing libraries are presented. From this, a set of 'canonical' design patterns, patterns displaying different mixtures of inheritance and genericity, is extracted. These patterns are contrasted with respect to qualitative dimensions concerning both the developers and the users of the library, namely: factorization, extendibility, shrinkability, time and space efficiency, ease of reuse, cost localization, and sideward compatibility. TECHNIQUES FOR INCREASING THE ROBUSTNESS OF ITERATIVE ALGORITHMS FOR MULTI-RESOURCES LOCATION PROBLEMS [TECNICHE PER AUMENTARE LA ROBUSTEZZA DEGLI ALGORITMI ITERATIVI PER PROBLEMI DI LOCALIZZAZIONE MULTI-RISORSE]

Giovanni Righini May 1993 49 p In ITALIAN Sponsored in part by Ministry of University and Scientific and Technological Research

(Rept-93-037; ETN-94-95806) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

Multi-resource location problems can be seen as combinations of single resource allocation and location problems; therefore, many of the algorithms proposed in the literature have an iterative structure in which the two phases of allocation and location alternate until convergence to a local optimum solution. Some procedures inspired by the principal of local search are proposed. The procedures are in a position to perturb the local optimum configuration for possibly converging to a better solution. Problems in the euclidean plane and on graphs are considered in static and dynamic versions in which the input data varies with time. The validity of the technique is illustrated with results relating to an experimental proof carried out. ESA

EXACT SOLUTION OF THE SINGLE MACHINE SCHEDULING PROBLEM WITH EARLINESS AND FLOW TIME PENALTIES

Mauro DellAmico, Silvano Martello, and Daniele Vigo 1993 21 p

(Rept-93-038; ETN-94-95807) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

Given a set of tasks with associated processing times, deadlines, flow time penalties, and earliness penalties, the problem of determining a task schedule, on one machine, to minimize the total cost incurred by the penalties is considered. The problem is NP hard in the strong sense. A lower bound based on a preemptive relaxation, an approximation algorithm, and two exact approaches, one based on branch and bound and one on dynamic programming, is presented. An overall exact algorithm is obtained by combining these two approaches. Extensive computational experiments show the effectiveness of the proposed algorithms. ESA

A WORST-CASE ANALYSIS OF AN APPROXIMATE ALGORITHM FOR FINDING THE MINIMUM HAMILTONIAN CYCLE ON PATHS

Giovanni Righini and Marco Trubian Jun. 1993 10 p Sponsored in part by Ministry of University and Scientific and Technological Research

(Rept-93-042; ETN-94-95811) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

An algorithm for the problem of constructing the minimum length hamiltonian cycle, passing through some given paths, is presented. The value of the solution given by the algorithm is guaranteed to be not worse than 2 times the optimal value. ESA

N94-31212 Politecnico di Milano (Italy). Dipt. di Elettronica e Informazione.

A FINITE STATE MACHINE MODEL FOR OBJECT ORIENTED SYSTEMS

Stefano Paraboschi Jun. 1993 19 p

(Rept-93-040; ETN-94-95809) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

A Finite State Machine (FSM) model of an object system is proposed. Attributes, inheritance, and subtyping relations are characterized in the model, and a classification of composition mechanisms and a metric to compare subtypes is provided. FSM's provide a good model for objects since they represent in a natural way the concept of state which is not adequately represented in classical formalization models. This representation of states and dynamics introduces a new and more general definition of behavior compatibility. ESA

GUIDE TO SOFTWARE QUALITY ASSURANCE

Jul. 1993 52 p

(ISSN 0379-4059)

(ESA-PSS-05-11-Issue-1; ETN-94-95883) Copyright Avail: CASI HC A04/MF A01

Software quality assurance is defined and explained, guidelines on how to do it are presented, and the contents of a Software Quality Assurance Plan (SQAP) are detailed. A general discussion of the principles of SQA is presented. This expands upon ESA Procedures, Specifications, and Standards PSS-05-0, which describes the software enigineering standards that apply to all deliverable software implemented for the ESA, either in house or by industry. All the mandatory practices in ESA PSS-05-0 that apply to software quality assurance are repeated. ESA

DESIGN AND ANALYSIS OF SCALABLE PARALLEL ALGORITHMS Final Report, 27 Aug. 1990 - 26 Aug. 1993

Vipin Kumar 15 Nov. 1993 13 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract DAAL03-90-G-0201)

(AD-A276255; ARO-28408.1-MA-SDI) Avail: CASI HC A03

The objective of this research is to develop efficient parallel algorithms for a variety of problems and to analyze the scalability of new and existing parallel algorithms. Scalability analysis is an important tool used for predicting the performance of an algorithm-architecture combination when one or more of the hardware related parameters (interconnection network, speed of processors, speed of communication channels, number of processors) are changed. The problems studied as a part of this project come from diverse domains such as solution of differential equations, discrete optimization, neural network based learning, sorting and graph algorithms. In particular, we have studied parallel algorithms for solving linear systems using the preconditioned conjugate gradient method, partitioning of finite element meshes, balancing load in unstructured tree search arising in discrete optimization, the backpropagation neural network learning algorithm, dynamic programming, fast Fourier transform, sorting, shortest-path computation for graphs, robot motion planning, and matrix multiplication. PROOF OF CONCEPT FOR THE REWRITE RULE MACHINE: INTERENSEMBLE STUDIES Final Report

Jose Meseguer 23 Feb. 1994 83 p

(Contract N00014-90-C-0210)

(AD-A276506) Avail: CASI HC A05/MF A01

The main goal was to learn through simulation about the functionality and performance on realistic applications of an RRM system consisting of a collection of RRM ensemble chips (each such chip being a SIMD processor) connected on a network, and to design mechanisms to support the simultaneous parallel computation of applications across many such ensemble chips. To achieve these goals we first built a high-level interensemble simulator and ran a collection of benchmarks on it under varying assumptions about several architectural parameters to obtain a first estimate of the communication requirements for the RRM and to determine the feasibility of those requirements in view of existing network

technology. Using a second, very detailed register-transfer level simulator of a single ensemble and the performance results of a collection of applications run on it, together with modeling above the ensemble level, we also estimated interensemble performance; in this way we were able to obtain more detailed and accurate interensemble performance estimates. Mechanisms supporting parallel computations across many ensembles were also studied and designed. DTIC

ALGORITHMS AND STRUCTURES FOR REAL-TIME SIGNAL PROCESSING Final Report, 1 Jun. 1988 - 31 May 1992
Clifford T. Mullis 4 Feb. 1994 4 p Revised
(Contract DAAL03-88-K-0058)
(AD-A276101; CU-153-6951; ARO-25470.9-EL) Avail: CASI HC A01/MF A01

The study of digital signal processing is to a large extent the study of algorithms, but there is a natural classification into algorithms for design and algorithms for actual processing. Our research has been mainly concerned with the latter classification and has addressed structural constraints which arise because of resource limits and/or a desire for efficiency. This has led in a number of problems to some algebraic decomposition of algorithms with the intent of achieving parallelism and quality, as measured by the degree of approximation (bias) and roundoff noise and similar errors (variance). More recently, we have been studying problems which involve both classes of algorithms; for example, what is a good design (filter function or window) which must conform to structural constraints dictated by processing considerations. This has proven to be a rich area of application. DTIC

EXTENDER'S GUIDE FOR ARTIFACTS AND DRAFTS
Michael Karr, Glenn Holloway, and Steve Rosen 8 Feb. 1994 86 p
(AD-A276344) Avail: CASI HC A05/MF A01

To extend artifact and/or draft functionality in E-L, you must first have a working knowledge of how E-L is used. E-L is extended from within, by using the system to develop new functionality and then to augment the plexes that describe the structure of the artifacts system. This guide assumes you are familiar with the E-L Users' Manual. To add a tool to the system, you will also need to know how to develop C or Common Lisp programs using E-L, so you should also have read either the C and Unix Artifacts Manual or the Common Lisp Artifacts Manual. DEVELOPING THE MULTIMEDIA USER INTERFACE COMPONENT (MUSIC) FOR THE ICARUS PRESENTATION SYSTEM (IPS) Report, Jun. - Aug. 1993
Ingrid Bartnik Dec. 1993 21 p
(AF Proj. 4594)
(AD-A276341; RL-TM-93-6) Avail: CASI HC A03/MF A01

Rome Lab's Intelligence Technology branch provides modeling and simulation support to a variety of intelligence consumers and analysts, across a wide spectrum of application areas. Much of the research, development and capabilities demonstrations take place in the ICARUS Prototype Development and Demonstration Facility, named after the character from Greek Mythology who built the first prototype to solve a problem. In order to provide a cohesive development and demonstration architecture, as well as to advance the state-of-the-art in user interfaces and presentation techniques, the ICARUS Presentation System was envisioned, being comprised of two components: the Interactive VuGraph (InterVu) System and the Multimedia User Interface Component (MUSIC). This report documents the initial research, design and implementation of a prototype of the MUSIC system. DTIC

A PARALLEL IMPLEMENTATION OF THE COLUMN SUBTRACTION ALGORITHM
T. H. Smith 22 Dec. 1993 23 p
(Contract N00014-85-K-0198)
(AD-A275922; MSRR-596) Avail: CASI HC A03/MF A01

We have implemented Harche and Thompson's column subtraction algorithm for the set partitioning problem on the CN-200 Connection Machine. The implementation involved partitioning the large array of processors in the CM-2 into segments and letting each segment explore a different part of the search tree generated by the column subtraction algorithm. Our reported computational results indicate that the segments are highly utilized and that good speed-ups are obtained as the number of segments is increased. DTIC

A COMPARISON OF PRODUCT REALIZATION FRAMEWORKS Final Report
Brian S. Cohen, Earl Ecklund, Michael Frame, Michael W. Marean, and Stephen Yencho Oct. 1993 68 p
(Contract MDA903-89-C-0003)
(AD-A275992; IDA-D-1439; IDA/HQ-93-44605; AD-E501747) Avail: CASI HC A04/MF A01

In 1991, DoD established seven key science and technology thrust areas to assist in planning for investment in defense technology. The goals of thrust 7 are to develop new industrial capabilities that will lower product unit costs and life-cycle costs, shorten the lead time in design and manufacture of products, and increase product quality. This document reviews a set of software products, applications, and standards which are potential components of a DoD thrust 7 product realization infrastructure to support design and manufacturing activities for the advanced technology demonstrations (ATDs). This study is a quick sampling of software products and frameworks and is not intended to be either complete or comprehensive. The reviewed frameworks were each designed to meet the needs of a specific engineering discipline. No final recommendations or judgments about particular frameworks were made since a rigorous and detailed analysis of requirements has not been performed. None of the reviewed frameworks met all of the perceived needs for a thrust 7 and ATD framework, such as the need to design and analyze ATD products both within and across engineering disciplines. The best option for obtaining a product realization framework to accommodate thrust 7 needs appears to be the federation of multiple existing framework technologies to achieve the needed capabilities. Future work should include the extension of this study to cover all relevant frameworks and associated technology. The thrust 7 ATD requirements should be analyzed in order to properly recommend a framework that meets those requirements. DTIC

E-L USER'S MANUAL
Judy G. Townley 17 Feb. 1994 50 p
(Contract N00014-85-C-0710)
(AD-A276378) Avail: CASI HC A03/MF A01

E-L is a software development environment that reflects a fresh look at how the design of a programming system and the design of the languages it supports can reinforce each other in ways that increase software productivity. The benefits of this coordinated environment-and-language design are reflected most directly in E-L's tools for manipulating programs. In E-L, one sets up a structure that indicates a desired result. E-L uses a strategy called opportunistic scheduling to minimize manual tool invocation and to mediate the objectives of maximizing the use of tools and maximizing responsiveness. Most tool invocations are automatic, typically in response to editing or to actions taken by other tools, which are themselves automatically invoked. Because tools are scheduled, not run immediately, the system can optimize the use of resources. For example, the system may locate idle machines on the network and use them for invocations. The system will usually not run more than one scheduled tool on any one machine at a time (to minimize swapping and thrashing). DTIC

THE DEVELOPMENT AND USE OF AN EVALUATION MECHANISM FOR THE ASSESSMENT OF SOFTWARE CONFIGURATION MANAGEMENT TOOLS M.S. Thesis
Wayne M. Descheneau and Neil W. Robinson Dec. 1993 122 p
(AD-A275961; AFIT/GSS/LAS/93D-3) Avail: CASI HC A06/MF A02

This study investigated the development of a mechanism for use in the evaluation of Software Configuration Management (SCM) tool's. An examination of applicable DoD standards identified the SCM requirements that could be levied on a development contractor, and a literature search revealed the functionality common to various automated tools. These two sets of information were organized into a matrix, and for each requirement

that was met, the intersection on the matrix of the requirement and each functionality used to meet that requirement was checked. In addition to the matrix, the mechanism consisted of general information about a given tool and an area to substantiate each requirement identified as being met by the tool. The evaluation mechanism was then used to assess two commercially available SCM tools: Aide-De-Camp and the Product Configuration Management System. The evaluation mechanism prescribes a method for evaluating complex SCM tools and forces the evaluator to gain intimate knowledge of a tool to effectively assess the tool's merits for a given effort. A MODEL AND ALGORITHMS FOR A SOFTWARE EVOLUTION CONTROL SYSTEM M.S. Thesis
Salah E. Badr Dec. 1993 463 p
(AD-A276431) Avail: CASI HC A20/MF A04

This dissertation introduces an evolution control system (ECS) for the Computer Aided Prototyping System (CAPS). The purpose of the ECS is to automate the scheduling and the assignment of tasks to the software designers based on management policies and the dependencies in a model of the software configuration. The ECS controls the software evolution process in an incrementally evolving software system where the steps to be scheduled are only partially known. Time required, the set of subtasks for each step, and the input/output constraints between steps are all uncertain, and are all subject to change as evolution steps are carried out. The ECS provides computer assistance for managing such changes and partially automates the control of the design team and the project data. The ECS manages both the development/prototyping data and the design team through scheduling the software tasks and assigning them to members of the design team. The main goals of this system are: managing the evolution steps from the moment they are proposed until their completion; reaching a feasible schedule that meets the deadline requirements or minimizes the largest amount that a deadline is missed if all deadlines cannot be met and provides for the earliest possible completion for those steps that either do not have deadlines or have under-estimated deadlines; maximizing the efforts of software designers by maximizing concurrent assignments; supporting incremental replanning as additional information becomes available; and minimizing wasted design effort due to schedule reorganization as well as workers forced to wait for completion of subtasks. CONSISTENCY CHECKS FOR SCR-STYLE REQUIREMENTS SPECIFICATIONS Final Report
Constance L. Heitmeyer and Bruce G. Labaw 31 Dec. 1993 15 p
(AD-A276077; NRL/FR/5540-93-9586) Avail: CASI HC A03/MF A01

This report describes a class of software tools that check formal requirements specifications for consistency with a requirements model. The model, which describes properties of requirements specifications based on the SCR (Software Cost Reduction) approach to requirements, is summarized. Two experiments are described in which condition tables and mode transition tables in an updated version of the A-7 requirements document were checked for selected properties using tools we developed. The significant number of errors found by the tools is summarized. Tool-based techniques and manual techniques for performing consistency checks are compared, and several additional consistency checks, derived from the formal model, are identified. Our work is compared with related work by Parnas and SRI concerning the automated checking of tabular specifications. Conclusions are presented concerning the utility, cost, and scalability of tool-based consistency checking. DTIC

SOFTWARE REUSE CASE STUDY: TRILLIUM Final Report
David Dikel, Jonathan Rosoff, Paul Kengor, Jonathan Lichtenstein, and George DeMarco 13 Sep. 1993 58 p Prepared in cooperation with Applied Expertise, Inc., Arlington, VA
(Contract F19628-93-C-0129)
(AD-A276108; IBM-05021-002) Avail: CASI HC A04/MF A01

DoD has identified software reuse as a central strategy for improving the quality, timelines and cost efficiency of its weapons, command and control and other automated information systems. However, to reap full benefits from software reuse technology, DoD must change the way it does business. The question is how. This study provides a commercial example in which software reuse is specifically gauged and encouraged as a means to improve quality, timeliness and life-cycle cost. TRILLIUM's recommended software reuse practices are based upon over ten years of successful experience. Reuse is not isolated, but viewed as one of several activities, all of which are needed to ensure software capability. Further, evidence suggests that TRILLIUM has been widely adopted by managers and practitioners throughout Bell's supplier organizations (who have chosen to market TRILLIUM to their customers). As such, this example appears to provide the right goals, long-term experience base and successful approach for getting effective software reuse into practice. While there are clear differences between DoD and Bell, we believe that the experiences and lessons learned by Bell and its suppliers can provide perspective and insights to those who develop and implement DoD policy. AN APPLICATION REFERENCE MODEL FOR LAYERED MANUFACTURING
P. R. Kennicott 1994 23 p Presented at the International Conference on Rapid Product Development, Stuttgart, Germany, 31 Jan. 1994
(Contract DE-AC04-94AL-85000)
(DE94-006368; SAND-94-0123C; CONF-940154-1) Avail: CASI HC A03/MF A01

The Intelligent Manufacturing Systems (IMS) test case 6 project (rapid product development) was set up to demonstrate rapid product development and three dimensional measurement techniques where the agencies performing the work were distributed over different countries. Test case 6 provided a unique opportunity to examine the process by which an application protocol (AP) of the Standard for Exchange of Product Data (STEP) is prepared. The test case had a well defined scope, the production of simple parts by means of layered manufacturing techniques. The information concerned with this manufacture was similarly well defined, due to the requirement that the information be transmitted among the organizations participating in the test case. STEP is an international standard specifying the data content and format for storage and exchange of product data throughout the product's life cycle. STEP has been under development since 1984 and is just now emerging as an international standard. STEP is specified as a series of information models using the EXPRESS computer language. For purposes of data exchange, a mapping to a physical file format is specified. Informally, product data can be defined as all the data about a product which one might wish to save. This definition implies some variation in the amount of data to be saved in any one instance. In the case of test case 6, one would certainly wish to save the IGES files describing the part. One may or may not wish to save the manufacturing parameters. While there are many parts of STEP with different purposes,

the important series of parts for the purposes of standardizing product data are those dealing with application protocols. An application protocol specifies the details of product data within the context of a single application (in this case, layered manufacturing). Other AP's deal with such subjects as configuration-managed solid parts and associated drafting. DOE

LORE AND REASON MAINTENANCE

Bob Goedhart 1993 55 p

(ISSN 0922-5641)

(Rept-93-88; ETN-94-96133) Copyright Avail: CASI HC A04/MF A01

The knowledge representation language LORE was developed within the Delfi project aiming at a general purpose language for the development of knowledge based systems. The language combines several techniques developed in the field of AI (Artificial Intelligence) and can be used without posing restrictions to the application area it is used in. The knowledge engineering environment Delfi3 consists of several system components, such as a compiler, a linker, and an interpreter, for this language. The interpreter is the most important component, since it performs the actual execution of the knowledge base. The formal specification of this execution process is modeled in the execution model. The execution model of the language LORE is studied and extended with techniques from the field of reason maintenance. The use of these techniques will enable the interpreter to record and inspect its results, and to use these results in future inferences. This will result in a more efficient execution and, on top of that, in a database of reasons (the reason base) that can be used for other purposes as well. The results of the implementation of this execution model are compared with results from literature. ESA

POLYHEDRIC OBJECT RECOGNITION BY INDEXING IN A MODEL BASE Ph.D. Thesis [RECONNAISSANCE D'OBJETS POLYEDRIQUES PAR INDEXATION DANS UNE BASE DE MODELES]

Humberto Sossa 1992 133 p In FRENCH Sponsored by CONACYT, Mexico

(ETN-94-95913) Avail: CASI HC A07/MF A02

The problem of object recognition in presence of a large model base is addressed. The indexing of models can be described as follows: given a group of image indexes, quickly extract from the model base the models containing the index group. Since the combinatorial of the classic paradigm is prohibitive in this case, an indexing method by graph hashing is proposed. The principles are described: coding of image and models under a graph form, management of a model base by hash-coded tables, comparison of graphs on the basis of their polynomial characterization, and access to the model base. The system implemented according to these principles is described and experimental results are presented. ESA

EXTENSION OF THE LUSTRE LANGUAGE AND APPLICATION TO CIRCUIT DESIGN: THE LUSTRE V4 LANGUAGE AND THE POLLUX SYSTEM Ph.D. Thesis [EXTENSION DU LANGAGE LUSTRE ET APPLICATION A LA CONCEPTION DE CIRCUITS: LE LANGAGE LUSTRE-V4 ET LE SYSTEME POLLUX]

Frederic Rocheteau 1992 205 p In FRENCH

(ETN-94-95918) Avail: CASI HC A10/MF A03

The study of possible applications of the synchronous declarative language LUSTRE to the description of hardware circuits, and more particularly, given these characteristics, its data stream aspect notably, to data paths, is addressed. In relation to real time systems, of which the programming and verification constitute the preferred application domain of this language, synchronous circuits are generally much more regular and of a more important size. In order to allow an easy description of these applications, an extension of LUSTRE was developed. It adds to the language, while conserving its rigorous semantics: structured data and manipulation operators, a concept of generic subprograms, and limited recursion. The POLLUX system was then developed around this language. It decomposes into the following: a precompiler for semantic analysis of a program, to assure consistence; and various postprocessors of which the principal one is a synchronous circuit generator implanted afterwards on PAM, a machine based on prediffused programmable circuits--the other principal postprocessors are a classical sequential code generator, a graphical interface to pass from a text program to a scheme block and vice versa. COMPOSITIONALITY OF APPLICATION ORIENTED STRUCTURING MECHANISMS FOR ALGEBRAIC SPECIFICATION LANGUAGES WITH INITIAL SEMANTICS Ph.D. Thesis

Ingo Classen 1993 94 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ETN-94-95736) Avail: CASI HC A05

Specification concepts and structuring operations, which take into account structural relationships between components of a complex system and reduce the gap between the language level and the level of mathematical constructions are presented. The theoretical study was aimed to support structuring on syntactical and semantical levels, in order to facilitate a systematic development of structured systems. The theory was formulated with respect to the abstract notion of specification frames, and was based on structural properties of such frames like compositionality, which can be expressed in terms of category theory. Two aspects of structural relationships were discussed from a syntactical point of view: sharing was considered with respect to parametrized specifications and parameter passing, assuming two kinds of sorting strategies (quick sort and mergesort); structural equivalence was regarded with respect to parametrized specifications. Amalgamation constructions, based on the level of elementary specifications, were proposed to support structuring operations on the semantical level. It is concluded that the theory can be applied to the design of software systems. ESA

The automatic generation of help is addressed. Graphical user interfaces tend to get more and more complex, and consequently, the user needs help to work with these interfaces. Development of good help systems is very time consuming, if only because the help system needs to change whenever the specifications do. The context of the research is the User Interface Design Environment (UIDE) which uses high level application and interface representations to generate interfaces and help. Based on descriptions of an interface, help can be generated to answer two questions: why is an object not usable (grayed out); and how can it be made usable. Pre and post conditions, part of the semantics and sequencing control representations in UIDE, are used to answer these questions. The help system uses unsatisfied preconditions to explain why an object in the interface is disabled. A standard set of templates is used to translate often occurring predicates into text. A planner is used to derive how to enable the object in question. The help system looks at those predicates that must become true to enable the object, and searches for objects with corresponding post conditions. ESA

PERFORMABILITY MODELLING USING DyQNtool+

Boudewijn R. Haverkort and Anne-Marie Maass 13 Oct. 1993 16 p Presented at the 5th International Workshop on Petri Nets and Performance Models, Toulouse, France, 22-24 Oct. 1993

(ISSN 0924-3755)

(Memo-INF-93-45; TIOS-93-27; ETN-94-96107) Copyright Avail: CASI HC A03/MF A01

DyQNtool+, a tool for performability modeling based on the Dynamic Queueing Network concept, an approach in which stochastic Petri nets and queueing networks are combined, is described. In particular, DyNQNtool+ makes use of the tools SPNP (Stochastic Petri Net Package) and SHARPE (a tool for learning about stochastic models) for the computation of complex performability measures. With DyNQtool+, dynamic queueing network models can be easily constructed. The tool takes care

of the automatic translation of these models to a Markov reward model which is subsequently analyzed by performability analysis techniques. ESA

ARNOLDI CODE FOR COMPUTING SELECTED EIGENVALUES OF SPARSE REAL UNSYMMETRIC MATRICES

J. A. Scott Dec. 1993 45 p See also PB93-179588

(PB94-145182; RAL-93-097) Avail: Issuing Activity (Nationai Technical Information Service (NTIS))

Arnoldi methods can be more effective than subspace iteration methods for computing the dominant eigenvalues of a large sparse real unsymmetric matrix. In this paper we consider variants of the method of Arnoldi and discuss the design and development of a code to implement these methods. The new code, which is called EB13, offers the user the choice of a basic Arnoldi algorithm, an Arnoldi algorithm with Chebychev acceleration, and a Chebychev preconditioned Arnoldi algorithm. Each method is available in blocked and unblocked form. The performance of each option in the EB13 package is compared with that of subspace iteration on a range of test problems and, on the basis of the results, advice is offered to the user on the appropriate choice of method. The Graphical Kernel System-9x (GKS-9x) refers to the current state (Draft International Standard) of the revision of GKS which was published as an International Standards Organization (ISO) standard for computer graphics programming in August 1985. A part of the GKS-9x standard was implemented at Rutherford Appleton Laboratory to explore the feasibility of the new concepts as well as the behavior of GKS-9x. This paper explores the effects of the number of primitives manipulated in an application on the experimental GKS-9x implementation performance. It also identifies the major factors which increase the GKS-9x function execution times. Finally, the improvement in speed obtained when optimization was included in the traversal process is analyzed and discussed. The application was made based on the seating plan of a theater consisting of 1,154 seats. NTIS

A GAUSS-SEIDEL TYPE SOLVER FOR SPECIAL CONVEX PROGRAMS, WITH APPLICATION TO FRICTIONAL CONTACT MECHANICS

E. A. H. Vollebregt 1993 26 p

(ISSN 0922-5641)

(Rept-93-77; ETN-94-96122) Copyright Avail: CASI HC A03/MF A01

A method that solves the constrained minimization of a convex function, when the constraints g(sub j)(x(sub 1),...,x(sub n)) less than or equal to 0 are function of only a few variables and can be partitioned in some way, is described. A proof of convergence is given which is based on the fact that the function values that are generated decrease. The relation to the nonlinear equation solver TanGS is shown, together with results for TanGS. The solver is applied to the solution of tangential traction in contact mechanics. ESA

USING ATOMIC ACTIONS IN REPLICA GROUPS TO SIMPLIFY THE REPLICATION IMPLEMENTATION

L. H. A. Bouwmeester, P. G. Kluit, and F. Ververs 1993 23 p

(ISSN 0922-5641)

(Rept-93-78; ETN-94-96123) Copyright Avail: CASI HC A03/MF A01

Active replica groups require complex protocols implementing ordering and delivery guarantees to ensure state consistency. These protocols have an impact on the performance of the replica groups. A demonstration that using atomic actions in the replication infrastructure allows the use of a simpler protocol is given. Execution failures of this protocol to ensure the ordering and delivery guarantees can now be managed within atomic actions by relying on their serialization property. The atomic actions are integrated in the replication infrastructure in such a way that interacting groups are not aware of each other's group membership changes. ESA

DESIGNING IN VIRTUAL REALITY: MODELLING OBJECTS IN A VIRTUAL ENVIRONMENT (MOVE)

P. A. J. Brijs, T. S. Hoek, C. A. P. G. vanderMast, and G. J. F. Smets 1993 16 p

(ISSN 0922-5641)

(Rept-93-91; ETN-94-96136) Copyright Avail: CASI HC A03/MF A01

A CAD (Computer Aided Design) system developed to provide designers with modeling tools that can be used in a virtual environment is described. The design of the environment and the way in which the user is assisted to perform his task in the virtual environment are discussed. The MOVE system allows the user to operate in an intuitive and everyday style of work. This is done by offering tools that can be grabbed and handled. Each tool enables a designer to directly manipulate and transform the virtual models in a specific way, providing appropriate visual, auditory and tactile feedback during the operation. With these tools designers can recapture the three dimensional aspect of building and shaping models, which is lost when working behind computer screens. CAD systems for use in a virtual environment offer designers the possibility to not only see their products in an early stage of design, but to also simulate and explore using them, without having to manufacture a physical model. Parts of the functionality of the MOVE system and the way the four level approach by Foley was used to develop the program are described. ESA

Development of an active vision system for three dimensional object recognition by robots was based on an approach combining object pre-marking and active sensing. A set of problems within the framework of the proposed active vision system was investigated. The optimal object pre-marking problem is defined as determining the minimum number of markers and their best locations on a given set of objects. A dynamic programming based method is developed to solve this problem. The problem

of optimal placement of a mobile camera is addressed in terms of guaranteeing the detection of markers on a viewed object. This problem is divided into two sub-problems: determining the camera's initial location(s) for detecting an initial marker, and determining the camera's secondary locations for detecting an additional marker when the first acquired image is insufficient for recognizing the object. The former is solved based on probability theory and computational geometry; the second is solved by a similar method as well as utilizing a-priori knowledge of marker locations. The problems of object pre-marking and camera placement are also integrated into a single problem. The I-DEAS computer-aided design package is used to facilitate the solution methods. A prototype of the proposed active vision system was implemented for the experimental verification of the methods developed. Author (CISTI)

MORPHOLOGICAL DIRECTIONAL CODING OF IMAGES Ph.D. Thesis

Samuel Ziheng Zhou Oct. 1993 182 p

(ISBN-0-315-86336-6; CTN-94-61191) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Image feature extraction is used in image coding for exploiting the properties of the human visual system in order to achieve good perceptual quality at a low bit rate. A new image coding scheme, morphological directional coding (MDC), is introduced. In MDC, feature extraction is accomplished through various types of nonlinear morphological filters. Each image is decomposed into a hierarchy of image features which are subsequently encoded by appropriate coding methods based on the perceptual significance of the features. Sequential filters are used to generate a multiresolution representation in which line features of different width resolutions are separated. A morphological directional filter bank is developed to group the extracted line features according to their orientations so that the features can be represented efficiently by subsampling and modeling. A hierarchical vector quantization scheme is developed to encode information regarding edges, textures, and smooth regions. A hybrid vector structuring element decomposition algorithm is also developed for fast implementation of morphological filters. Using this algorithm can significantly reduce the computational complexity of a morphological filter using the structural element. Author (CISTI)

STEREOSCOPIC CORRESPONDENCE BASED ON THE STRUCTURE OF SHADING M.S. Thesis [CORRESPONDANCE STEREOSCOPIQUE BASEE SUR LA STRUCTURE DE L'OMBRAGE]

Michel Albert Audette Aug. 1992 189 p In FRENCH

(ISBN-0-315-86418-4; CTN-94-61194) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A region-based two-view matching algorithm is proposed for solving the correspondence problem in stereoscopic vision. In the algorithm, regions are computed from the Gaussian (K) and mean (H) curvature information of the image intensity surface. A region, defined as a connected area of constant K/H sign combination, constitutes the footprint of a local section of the intensity surface. Neighborhood information is made explicit by means of an adjacency graph representation of the region map. The adjacency graph is the dual of the modified Voronoi diagram of the region map, which is computed by isotropically growing each region. Matching is attempted between nodes of identical shape types in the two region maps by comparing their intra-regional characteristics along with the topological configuration of their immediate neighborhoods. The disparity map is established through a coarse-to-fine strategy. The interpolation technique is a two-stage algorithm: a least median of squares approximation and a weighted bicubic spline interpolation. The final product, computed from disparity vectors produced at the finest resolution level, is a dense disparity function which can be used to obtain the structure and motion of the elements of the scene. VOLUMETRIC MODELLING OF THREE DIMENSIONAL SCENES BY OCTREE DECOMPOSITION OF GEOMETRIC MODELS M.S. Thesis [MODELISATION VOLUMETRIQUE DES SCENES TRI-DIMENSIONNELLES PAR DECOMPOSITION OCTAIRE DE MODELES GEOMETRIQUES]

Pierre Vachon Nov. 1993 101 p In FRENCH

(ISBN-0-315-86866-X; CTN-94-61235) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Certain applications of three dimensional vision profit from volumetric representation offered by octrees. Since these structures are typically difficult to obtain starting from a simple geometric description, a method of conversion has been developed with a view to allow creation of volumetric models. This conversion permits passage from a simple geometric format to an octree format through a recursive partitioning of space. The algorithm to carry out the conversion is implemented in software called Octavue which allows the user to enter geometric scenes, adjust partitioning parameters, and visualize the resulting octree structures. Further improvements to the algorithm and software are proposed. A user guide to Octavue is appended. CISTI

METHODS OF IMPLEMENTING THE VITERBI ALGORITHM ON A MASSIVELY PARALLEL COMPUTER OF THE SIMD (SINGLE INSTRUCTION MULTIPLE DATA) TYPE M.S. Thesis [METHODES DE REALISATION DE L'ALGORITHME DE VITERBI SUR ORDINATEUR MASSIVEMENT PARALLELE DE TYPE SIMD]

Sebastien Roy Apr. 1993 99 p In FRENCH

(ISBN-0-315-86783-3; CTN-94-61229) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Methods for parallelization of the Viterbi algorithm are proposed with a view to their implementation on a massively parallel computer. The computer in question, the MasPar MP1, is characterized by a single instruction multiple data architecture, which implies certain constraints on the level of efficiency of the algorithms proposed. The fixed objective is to obtain the optimum efficiency and the maximum speed possible on the MasPar, taking account of the constraints of the parallel architecture and the Viterbi algorithm itself. In addition to the ordinary Viterbi algorithm, a decoder for trellis coded modulation codes is also realized on the MasPar. Finally, a new suboptimal decoding algorithm is tested with the goal of improving the exploitation of the architecture and the internal topology of the MasPar. The decoder software thus obtained allow rapid carrying out of simulations of experimental communication systems. The study of the proposed parallel algorithms and their performance can also be useful in the design of future decoders for very large scale integration. CISTI

The traditional approach to software development has a lot of limitations and problems associated with it. There's a technique that is different from the traditional software development process. It's called megaprogramming. Megaprogramming is in the research stage, although individual ideas within megaprogramming have been in use within industry for years. Because megaprogramming is in its infancy, some of the terms and some of the specific details may change. The underlying concepts and principles behind megaprogramming are unlikely to change. Today, this manual explains traditional software development concepts and introduces mega-programming. DTIC

HIERARCHICAL MIXTURES OF EXPERTS AND THE EM ALGORITHM Memorandum Report

Michael I. Jordan and Robert A. Jacobs 6 Aug. 1993 31 p

(Contract N00014-90-J-1942; NSF ASC-92-17041; NSF IRI-90-13991; NSF ECS-92-16531)
(AD-A276516; AIM-1440; CBCL-Memo-83) Avail: CASI HC A03/MF A01

We present a tree-structured architecture for supervised learning. The statistical model underlying the architecture is a hierarchical mixture model in which both the mixture coefficients and the mixture components are generalized linear models (GLIM's). Learning is treated as a maximum likelihood problem; in particular, we present an Expectation-Maximization (EM) algorithm for adjusting the parameters of the architecture. We also develop an on-line learning algorithm in which the parameters are updated incrementally. Comparative simulation results are presented in the robot dynamics domain. DTIC

Recent developments in the area of reinforcement learning have yielded a number of new algorithms for the prediction and control of Markovian environments. These algorithms, including the TD(lambda) algorithm of Sutton (1988) and the Q-learning algorithm of Watkins (1989), can be motivated heuristically as approximations to dynamic programming (DP). We provide a rigorous proof of convergence of these DP-based learning algorithms by relating them to the powerful techniques of stochastic approximation theory via a new convergence theorem. The theorem establishes a general class of convergent algorithms to which both TD(lambda) and Q-learning belong. DTIC

A REDUNDANT DISK ARRAY ARCHITECTURE FOR EFFICIENT SMALL WRITES

Daniel Stodolsky, Mark Holland, William V. Courtright, II, and Garth A. Gibson 20 Oct. 1993 67 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract MDA972-90-C-0035; NSF ECD-89-07068; ARPA Order 7330)
(AD-A276645; CMU-CS-93-200) Avail: CASI HC A04

Parity encoded redundant disk arrays provide highly reliable, cost effective secondary storage with high performance for reads and large writes. Their performance on small writes, however, is much worse than mirrored disks--the traditional, highly reliable, but expensive organization for secondary storage. Unfortunately, small writes are a substantial portion of the I/O workload of many important, demanding applications such as on-line transaction processing. This paper presents parity logging, a novel solution to the small write problem for redundant disk arrays. Parity logging applies journalling techniques to substantially reduce the cost of small writes. We provide a detailed analysis of parity logging and competing schemes--mirroring, floating storage, and RAID level 5--and verify these models by simulation. Parity logging provides performance competitive with mirroring, the best of the alternative single failure tolerating disk array organizations. However, its overhead is close to the minimum offered by RAID level 5. Finally, parity logging can exploit data caching much more effectively than all three alternative approaches. DTIC

LARGE-SCALE SHAPE OPTIMIZATION: NUMERICAL METHODS, PARALLEL ALGORITHMS, AND APPLICATIONS TO AERODYNAMIC DESIGN Ph.D. Thesis

Carlos Eduardo Orozco 1993 150 p
Avail: Univ. Microfilms Order No. DA9322751

Motivated by flight vehicle design problems, this work focuses on large-scale optimization problems in which the design variables are parameters describing shape. It deals with several Sequential Quadratic Programming methods that can be used to advantage for the solution of shape optimization problems that involve systems governed by nonlinear partial differential equations. Its main contribution is the development of a family of Coordinate Basis Infeasible Path (CBIP) optimization methods and its implementation in highly parallel architectures. The methods avoid the solution of the discretized form of the state equations at each design iteration by embedding them as equality constraints in the optimization problem. CBIP methods make use of a decomposition into nonorthogonal subspaces that exploits Jacobian and Hessian sparsity in an optimal fashion. In the absence of a line search, the resulting algorithms require the solution of just two or three linear systems per optimization iteration. They are therefore more efficient than traditional path-following methods which typically require many stiffness matrix solves to fully converge the nonlinear state equations at each optimization iteration. In the massively parallel implementation, the construction and solution of the algebraic systems is performed in parallel, as are sensitivity computations associated with the state variables. Parallelism is thus extended to computation of the gradient of the objective function with respect to the state variables, the Lagrange multipliers, the gradient of the state equations with respect to the design variables, and the projected gradient. The parallel optimization algorithms require no additional communication routines nor parallel data structures beyond those needed for the parallel solution of the state equations. The algorithms are applied to a two dimensional aerodynamic design problem, that of determining the shape of an airfoil which produces a desired pressure distribution in the presence of compressible potential flow. Shape optimization problems of up to 90 shape variables, 8,316 state variables, and 16,264 finite elements are solved. The parallel efficiency of the algorithms, i.e., the portion of time spent on parallel tasks relative to the overall time, is high, and they scale well, for a practical number of design variables. A THEORY OF DISTRIBUTED TIME

Sean W. Smith Dec. 1993 138 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract F33615-93-1-1330; NSF CCR-88-58087)
(AD-A276631; CMU-CS-93-231) Avail: CASI HC A07

Natural intuition organizes experience into a linear sequence of discrete events, but this approach is inappropriate for asynchronous distributed systems, where information is distributed and perception is delayed. Distributed environments require a distributed notion of time, to abstract away not only irrelevant physical detail but also irrelevant temporal and computations detail. By expressing distributed systems concepts that are difficult to talk about in terms of real time and by distinguishing what really 'happens' from what physically occurred, a theory of distributed time would provide a natural framework for solving problems in distributed environments. This paper lays the groundwork for that claim by formally building such a theory. This research improves on previous work on time in distributed systems by supporting temporal relations more general than partial orders, by supporting abstraction through multiple levels of temporal relations, by separating the family of temporal relations an application consults from the particular clock implementations that track them, and by providing a single arena to consider these issues for a wide range of applications. INCREMENTAL RECOMPILATION FOR STANDARD ML OF NEW JERSEY

Robert Harper, Frank Pfenning, Peter Lee, and Eugene Rollins Feb. 1994 12 p

(Contract F19628-91-C-0168; ARPA Order 8313)
(AD-A276522; CMU-CS-94-116) Avail: CASI HC A03/MF A01

The design and implementation of an incremental recompilation manager (IRM) for Standard ML of New Jersy (SML/NJ) is described. Truly separate compilation is difficult to implement correctly and efficiently for SML because one compilation unit may depend not only on the interface of another, but also on its implementation. In this paper we present an integrated compilation system base on the 'visible compiler' primitives provided by SML/NJ that supports 'smart recompilation' to minimize system build time in most situations. Large systems are presented as hierarchical source groups. An automatic dependency analyzer determines constraints on the order in which sources must be considered. By abstracting away from the specifics

of the SML/NJ compiler, the IRM readily generalizes to arbitrary 'compilation tools' such as parser generators and embedded languages. DTIC

AN MS-DOS FILE SYSTEM FOR UNIX
Alessandro Forin and Gerald R. Malan Sep. 1993 24 p
(Contract DABT63-93-C-0054)
(AD-A276523; CMU-CS-93-196) Avail: CASI HC A03/MF A01

We have written DosFs, a new file system for UNIX that uses MS-DOS data structures for permanent storage. DosFs can be used anywhere a traditional UNIX file system can be used, and it can mount disks written by MS-DOS as regular UNIX partitions. DosFs can be used as the root partition and exported by an NFS server. Our motivation for this work was efficient disk space utilization; DosFs provides from 10 to 13 percent better disk utilization than the 4.3 BSD Fast File System (FFS). In addition, we found that the disk block allocation algorithm used by DosFs lets us exploit large contiguous disk operations, providing a five-fold improvement over FFS for uncached operations. To the best of our knowledge, this is the first file system implementation that allows the user to specify the logical block size at mount time. A user can mount the same file system with a larger block size when file accesses tend to be sequential and a smaller one when they tend to be scattered. The MS-DOS structures were designed for a single-user system and do not support access control. We solved this problem with simple extensions that are backward-compatible with MS-DOS. DTIC

VISUAL EVALUATION OF COMPUTER-GENERATED TEXTURES Final Report, Oct. 1990 - Mar. 1993
George A. Geri, Don R. Lyon, and Yehoshua Y. Zeevi Jan. 1994 42 p
Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F33615-90-C-0005)
(AD-A277201; AL/HR-TR-1993-0189) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Textures generated by superimposing sinusoidal luminance distributions can be used to simulate the natural terrain textures often used in flight simulator imagery. Since the visual system is spatially inhomogeneous with the periphery being generally less sensitive than the center of the visual field, simpler, more easily generated textures can potentially be used to simulate terrain that is farther from the operator's point of regard. The minimal number of component sinusoids required to generate textures that are visually acceptable in the visual periphery was estimated for the discrimination of complex suprathreshold textures. Specifically, similarity ratings were obtained to determine the effects of component orientation and component phase-bandwidth on the cortical magnification factor (CMF) associated with that discrimination. The textures were designed to be both specifically by a relatively small number of localized spectral components and sufficiently complex to approximate natural images. The number of component orientations was found to be a particularly important determinant of texture discrimination in that its effect on rated similarity was largely independent of the total number of components making up the texture. When the number of components was varied, a CMF of 2 was sufficient to equate the similarity ratings obtained at 0.75 deg and 20 deg. Under the same conditions, a CMF of 4 clearly overcorrected the data. The estimated CMF for texture discrimination is much smaller than that found for the discrimination of simple 2-D spatial frequency and suggests that either quantitatively different cortical mechanisms or different cortical areas are responsible for the two types of discrimination. HIGH PERFORMANCE HARDWARE AND SOFTWARE FOR PATTERN RECOGNITION AND IMAGE PROCESSING Status Report, 8 Nov. 1993 - 31 Jan. 1994
Wendell A. Henry 15 Feb. 1994 5 p
(Contract N00014-93-C-0234)
(AD-A276405) Avail: CASI HC A01/MF A01

The contract was given tentative funding approval on November 8, 1993. At that time work on Phase 1 of the contract started. The contract was formally approved December 30, 1993. During the first three months of the contract efforts have centered on planning and scheduling the Phase 1 projects and beginning work on the defined tasks. Progress was made in the definition and design of the CNAPS/PC hardware board (image processing accelerator board that plugs into a PC) that will be developed during Phase 1. Likewise, progress was made in the initial design and prototyping of the software to be developed in this phase of the project. DTIC

INTEGRATED TRUSTED SYSTEM DEVELOPMENT ENVIRONMENT PROCESS Final Report, Apr. 1991 - Dec. 1992
Terry C. Benzel, Douglas W. Rothnie, and Stephen D. Crocker Oct. 1993 145 p
(Contract F30602-91-C-0049)
(AD-A276414; RL-TR-93-193) Avail: CASI HC A07/MF A02

The Integrated Trusted System Development Environment (ITSDE) Process project has further extended and refined the Integrated Development Process (IDP) defined previously by the authors. The result is a set of integrated Data Item Descriptions (DID's) for use with the process and tailoring directions for producing the DID's. The IDP describes a software development process for developing trusted systems under DoD-STD-2167A. The process is based on an approach which integrates the Trusted Compute System Criteria (TCSEC) requirements contained in DOD-5200-28-STD into the software development process required by DoD-STD-2167A. The IDP focuses on development of 2167A DID's which have been tailored to include TCSEC deliverables. The IDP describes how these items can be produced in a manner which minimizes the impact on cost and budget, while increasing assurance in the product's trustworthiness. The majority of the work reported here was performed during the period 1 Apr 91. DTIC

CMS PREPROCESSING SUBSYSTEM USER'S GUIDE: SOFTWARE VERSION 2.0
B. T. Didier, J. D. Gash, F. L. Greitzer, S. L. Havre, J. V. Ramsdell, and C. R. Turney Dec. 1993 75 p
(Contract DE-AC06-76RL-01830)
(DE94-005327; PNL-8995) Avail: CASI HC A04/MF A01

The Common Mapping Standard (CMS) Data Production System (CDPS) produces and distributes CMS data in compliance with the Common Mapping Standard Interface Control Document. CDPS is composed of two subsystems, the CMS Preprocessing Subsystem (CPS) and the CMS Distribution Subsystem (CDS). This guide describes the operation of CPS. CPS is responsible for the management of source data and the production of CMS data from source data. The CPS system was developed for use on a workstation running Ultrix 4.2, the X Window System Version X11R4, and motif Version 1.1. This subsystem is organized into four major functional groups and supports production of CMS data from source chart, indose, and elevation data products. DOE

METHODS FOR PARALLELIZING SEARCH PATHS IN PHRASING
Carl DeMarcken Aug. 1993 115 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-4038; NSF ASC-92-17041)
(AD-A276876; AI-TR-1453) Avail: CASI HC A06

Many search problems are commonly solved with combinatoric algorithms that unnecessarily duplicate and serialize work at considerable computational expense. There are techniques available that can eliminate redundant computations and perform remaining operations concurrently, effectively reducing the branching factors of these algorithms. This thesis applies these techniques to the problem of parsing natural language. The result is an efficient programming language that can reduce some of the expense associated with principle-based parsing and other search problems. The language is used to implement various natural language parsers, and the improvements are compared to those that result from implementing more deterministic theories of language processing. DTIC

TRANSLUCENT PROCEDURES, ABSTRACTION WITHOUT OPACITY
Guillermo J. Rozas Oct. 1993 180 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-92-J-4097; NSF MIP-90-01651)
(AD-A276877; AI-TR-1427) Avail: CASI HC A09

This report introduces translucent procedures as a new mechanism for implementing behavioral abstractions. Like an ordinary procedure, a translucent procedure can be invoked, and this provides an obvious way to capture a behavior. Translucent procedures, like ordinary procedures, can be manipulated as first-class objects and combined using functional composition. But unlike ordinary procedures, translucent procedures have structure that can be examined in well-specified non-destructive ways, without invoking the procedure. DTIC

MULTIGRAPH: AN ARCHITECTURE FOR MODEL-BASED PROGRAMMING. MODEL-BASED PROGRAM SYNTHESIS FOR PARALLEL COMPUTING. PREMOS: PROGRAMMING ENVIRONMENT FOR MODEL-BASED PROGRAM SYNTHESIS, VERSION 01.00.00
Janos Sztipanovits, Ben Abbott, and Hubertus Franke Mar. 1994 59 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract MDA972-92-J-1018)
(AD-A276949; SPC-93154-CMC) Avail: CASI HC A04/MF A01

This presentation consists of three presentations related to model-based software synthesis. The first presentation provides an overview of the MULTIGRAPH Architecture (MGA), which is used as a generic framework for model-based programming. Evolution of the architecture has been driven by the requirements of specific applications. Characteristics of these application domains and their impact on the basic design of MGA are discussed. The second presentation discusses Model-Based Program Synthesis for Parallel Computing. Automatic program synthesis is one of the prime disciplines that can contribute to the advancement of the software engineering of reactive systems. A large, high-performance parallel instrumentation system used for analysis of turbine engine strain gauge signals produced during altitude testing is presented as an illustration. The system is called the Computer Assisted Dynamic Data Analysis and Monitoring System (CADDMAS). The third presentation discusses a Programming Environment for Model-Based Program Synthesis. The development of model-based programming environments is driven by two opposite forces: specialization and Standardization. The presentation addresses the design and implementation of tools which satisfy both above-mentioned forces. In order to overcome this dilemma, the MULTIGRAPH Architecture uses meta-tools. This presentation focuses on the design and implementation of meta-tools and their coordination to form a harmonic environment. DTIC

AN ALGORITHM FOR PROBABILISTIC, TOTALLY-ORDERED TEMPORAL PROJECTION
Drew McDermott Mar. 1994 57 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1577)
(AD-A277341; YaleU/DCS/RR-1014) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Temporal projection, defined as the prediction of what might happen when a plan is executed, is an important component of many planning algorithms. To achieve efficiency, it is desirable for a projection to be a totally ordered event sequence. To cope with uncertainty, the events must be generated using probabilistic rules. We require a rule language that allows us to specify what can happen when an event occurs, as well as what events can occur when certain propositions are true. The language has a formal semantics, which allows us to prove that a set of rules has a unique model (if it is consistent). This language supports a Monte Carlo style of projection, in which event sequences are sampled randomly using the probabilities in the rules. The output of the projector is a timeline that allows a planning algorithm to test the truth of propositions at arbitrary points. The algorithms for building and retrieving from the timeline can be shown to be correct. Experiments show that for a typical theory, the time to build a timeline is a quadratic function of the number of events in the timeline. DTIC

INFORMAL INTRODUCTION TO THE EXTENDED AFFIX GRAMMAR FORMALISM AND ITS COMPILER
M. Seutter 13 Sep. 1993 56 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant SION-612-317-404)
(TR-93-19; ETN-94-96213) Avail: Issuing Activity (European Space Agency (ESA))

The Extended Affix Grammar (EAG) formalism, a formalism for describing both the context free and the context sensitive syntax of languages, and its compiler are introduced. EAG is a member of the family of two level grammars. They are very closely related to two level van Wijngaarden grammars. To a description in EAG the EAG compiler may be applied, generating either a recognizer or a transducer or a translator or a syntax directed editor for the language described. Attention is paid to the ideas behind the language and the language concepts are elucidated by examples. The use of the compiler and the options that may be used to steer the generation process are discussed. ESA

APPLICATIONS OF DATA COMPRESSION TO 3-D SCALAR FIELD VISUALIZATION Ph.D. Thesis
Paul Ning 1993 133 p
Avail: Univ. Microfilms Order No. DA9326533

Scientific visualization is the use of computer graphics techniques for analyzing and displaying experimental or simulated data, and has been promoted as an efficient tool for understanding large, multidimensional datasets that arise in many applications. The use of visualization does not eliminate, however, the problem of data management; rather, data management issues must be addressed by the visualization tools themselves. Thus, it is only natural to apply data compression techniques in order to improve the performance of visualization systems. In this dissertation, we demonstrate how compression can be beneficial to both isosurface generation and volume rendering, two common techniques for displaying volumetric (three dimensional) scalar fields. Isosurface generation involves

the construction of a polygonal model which approximates a contour surface in the volume. The number of polygons generated can be quite large, however, which increases rendering time and storage costs. We develop a variable-resolution isosurface generation algorithm which constructs accurate surface models over a wide range of compressed polygon counts. This algorithm imposes an octree hierarchy on the volume data, and applies tree pruning techniques to find good surface models at lower resolutions. Instead of extracting and displaying a single surface, volume rendering treats the entire three dimensional scalar field as a collection of sources and attenuators, and integrates these contributions along the viewing direction to form a projected image of the translucent volume. A volume renderer requires access to all of the scalar field samples, as well as to several derived quantities. For large datasets, the storage used by these methods can be very high, and rendering speed is generally slow. We introduce a compressed volume format based on vector quantization that provides storage savings and that may also be exploited for faster rendering. Dissert. Abstr.

NASTRAN (NASA Structural Analysis Program) is the most widely used general purpose structural analysis program in the world. This program was originally developed in the mid-sixties, and the first version was released in 1968. This development in the form of enhancements and maintenance was continued until 1972 as a single government version under the sponsorship of NASA. Since then the government version is being developed as COSMIC-NASTRAN, while a commercial version is being marketed by McNeal and Swendler Corporation (MSC) as MSC-NASTRAN. Even through the basic structure of these two versions remains the same, there are significant differences in capabilities and efficiencies. Around 1980 the MSC introduced a new plate bending element called the QUAD4 to its element library. It is one of the most versatile plate bending elements, even though its theoretical basis is somewhat controversial. DTIC

INTERACTIVE GRAPHICAL MODEL BUILDING USING TELEPRESENCE AND VIRTUAL REALITY

C. Cooke (Massachusetts Inst. of Tech., Cambridge.) and S. Stansfield 1993 5 p Presented at the IEEE International Conference on Robotics, San Diego, CA, 8-13 May 1994

(Contract DE-AC04-94AL-85000)

(DE94-001421; SAND-93-1977C; CONF-940550-2) Avail: CASI HC A01/MF A01

This paper presents a prototype system developed at Sandia National Laboratories to create and verify computer-generated graphical models of remote physical environments. The goal of the system is to create an interface between an operator and a computer vision system so that graphical models can be created interactively. Virtual reality and telepresence are used to allow interaction between the operator, computer, and remote environment. A stereo view of the remote environment is produced by two CCD cameras. The cameras are mounted on a three degree-of-freedom platform which is slaved to a mechanically-tracked, stereoscopic viewing device. This gives the operator a sense of immersion in the physical environment. The stereo video is enhanced by overlaying the graphical model onto it. Overlay of the graphical model onto the stereo video allows visual verification of graphical models. Creation of a graphical model is accomplished by allowing the operator to assist the computer in modeling. The operator controls a 3-D cursor to mark objects to be modeled. The computer then automatically extracts positional and geometric information about the object and creates the graphical model. DOE

GRAFTED - GRAphical FAULT TREE EDitor: A FAULT TREE DESCRIPTION PROGRAM FOR TARGET VULNERABILITY/SURVIVABILITY ANALYSIS. USER MANUAL

Michael E. Buckland, Mark Webster, and Frank J. Tkalcevic Dec. 1993 28 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(AD-A277067; MRL-GD-0057; DODA-AR-008-614) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

A computer program, the GRAphical Fault Tree EDitor (GRAFTED), was written to simplify data entry and modification of component fault tree descriptions (FTD) used in military platform vulnerability/survivability analysis. GRAFTED uses a unique, graphical, screen based data entry procedure to define and display both individual system component parameters, and their hierarchical relationship in the overall system FTD. The generated component and system FTD output is in a format that is directly readable by the MRL version of the General Vulnerability Assessment Model, (GVAM), suite of computer programs. Although GRAFTED was specifically designed to generate FTD's for GVAM, it could be easily modified to accommodate data input formats and FTD output for other assessment procedures that require user friendly data entry and graphical fault tree editing and visualisation. This version of GRAFTED was written specifically for Tektronix UNIX workstations, and only runs on these machines. DTIC

Emacs LISP IN EDWIN SCHEME

Matthew Birkholz Sep. 1993 121 p

(Contract N00014-92-J-4097; NSF MIP-90-01651)

(AD-A276721; AI-TR-1451) Avail: CASI HC A06/MF A02

The MIT-Scheme program development environment includes a general-purpose text editor, Edwin, that has an extension language, Edwin Scheme. Edwin is very similiar to another general-purpose text editor, GNU Emacs, which also has an extension language, Emacs Lisp. The popularity of GNU Emacs has lead to a large library of tools written in Emacs Lisp. The goal of this thesis is to implement a useful subset of Emacs Lisp in Edwin Scheme. This subset was chosen to be sufficient for simple operation of the GNUS news reading program. DTIC

CASE STUDIES OF SOFTWARE PROCESS IMPROVEMENT METHODS Final Report

Daniel J. Paulish Dec. 1993 63 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract F19628-90-C-0003)

(AD-A277289; CMU/SEI-93-TR-26; ESC-TR-93-200) Avail: CASI HC A04

This report describes the case studies approach applied at a number of Siemens software development organizations to observe the impact of software process improvement methods. In addition, the report provides guidance to software development organizations that want to improve their processes. A set of organization performance measures are defined to help an organization observe its software process improvement over time. An approach is given for selecting software process improvement methods. The report concludes with a description of common implementation problems and recommendations for organizations to improve their software processes. DTIC

OPT++: AN OBJECT-ORIENTED CLASS LIBRARY FOR NONLINEAR OPTIMIZATION

J. C. Meza Mar. 1994 21 p

(Contract DE-AC04-76DR-00789)

(DE94-008890; SAND-94-8225) Avail: CASI HC A03/MF A01

Object-oriented programming is becoming a popular way of developing new software. The promise of this new programming paradigm is that software developed through these concepts will be more reliable and easier to re-use, thereby decreasing the time and cost of the software development cycle. This report describes the development of a C++ class library for nonlinear optimization. Using object-oriented techniques, this new library was designed so that the interface is easy to use while being general enough so that new optimization algorithms can be added easily to the existing framework. DOE

ON THE IMPLEMENTATION OF ERROR HANDLING IN DYNAMIC INTERFACES TO SCIENTIFIC CODES Ph.D. Thesis

C. J. Solomon Nov. 1993 51 p
(Contract W-7405-eng-48)
(DE94-008970; UCRL-LR-116004) Avail: CASI HC A04/MF A01

With the advent of powerful workstations with windowing systems, the scientific community has become interested in user friendly interfaces as a means of promoting the distribution of scientific codes to colleagues. Distributing scientific codes to a wider audience can, however, be problematic because scientists, who are familiar with the problem being addressed but not aware of necessary operational details, are encouraged to use the codes. A more friendly environment that not only guides user inputs, but also helps catch errors is needed. This thesis presents a dynamic graphical user interface (GUI) creation system with user controlled support for error detection and handling. The system checks a series of constraints defining a valid input set whenever the state of the system changes and notifies the user when an error has occurred. A naive checking scheme was implemented that checks every constraint every time the system changes. However, this method examines many constraints whose values have not changed. Therefore, a minimum evaluation scheme that only checks those constraints that may have been violated was implemented. This system was implemented in a prototype and user testing was used to determine if it was a success. Users examined both the GUI creation system and the end-user environment. The users found both to be easy to use and efficient enough for practical use. Moreover, they concluded that the system would promote distribution. DOE

DESIGN OF GRAPHIC SCREENS USING NEURO LINGUISTIC PROGRAMMING
S. Alenka Brown-VanHoozer 1994 6 p Presented at the 1994 Society for Computer Simulation Multiconference, San Diego, CA, 11-15 Apr. 1994
(Contract W-31-109-eng-38)
(DE94-007634; ANL/IFR/CP-80791; CONF-940456-11) Avail: CASI HC A02/MF A01

Neuro linguistic programming (NLP) is an explicit and powerful model of human experience and communication which can be instrumental in designing pragmatic visual displays. It is a new approach to interacting with humans, based on modeling and outcomes. The original creators of NLP studied people who were successful in outcomes with their patients and modeled what these people did. Over sixteen years, the technique has crossed over into law, politics, business, and education. The intended use that is described in this paper is focused on the human factor aspect and visual display designs. DOE

IMPLEMENTATION AND DISPLAY OF COMPUTER AIDED DESIGN (CAD) MODELS IN MONTE CARLO RADIATION TRANSPORT AND SHIELDING APPLICATIONS
T. J. Burns 1994 10 p Presented at the 8th International Conference on Radiation Shielding, Arlington, TX, 24-27 Apr. 1994 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC05-84OR-21400)
(DE94-007221; CONF-940424-22) Avail: CASI HC A02

An X-window application capable of importing geometric information directly from two Computer Aided Design (CAD) based formats for use in radiation transport and shielding analyses is being developed at ORNL. The application permits the user to graphically view the geometric models imported from the two formats for verification and debugging. Previous models, specifically formatted for the radiation transport and shielding codes can also be imported. Required extensions to the existing combinatorial geometry analysis routines are discussed. Examples illustrating the various options and features which will be implemented in the application are presented. The use of the application as a visualization tool for the output of the radiation transport codes is also discussed. DOE

VARYING EXECUTION DISCIPLINE TO INCREASE PERFORMANCE
P. L. Campbell and A. B. Maccabe 22 Dec. 1993 44 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC04-94AL-85000)
(DE94-007844; SAND-93-4088) Avail: CASI HC A03

This research investigates the relationship between execution discipline and performance. The hypothesis has two parts: (1) different execution disciplines exhibit different performance for different computations; and (2) these differences can be effectively predicted by heuristics. A machine model is developed that can vary its execution discipline. That is, the model can execute a given program using either the control-driven, data-driven, or demand-driven execution discipline. This model is referred to as a 'variable-execution-discipline' machine. The instruction set for the model is the Program Dependence Web (PDW). The first part of the hypothesis will be tested by simulating the execution of the machine model on a suite of computations, based on the Livermore Fortran Kernel (LFK) Test (a.k.a. the Livermore Loops), using all three execution disciplines. Heuristics are developed to predict relative performance. These heuristics predict the execution time under each discipline for one iteration of each loop and the number of iterations taken by that loop; then the heuristics use those predictions to develop a prediction for the execution of the entire loop. Similar calculations are performed for branch statements. The second part of the hypothesis will be tested by comparing the results of the simulated execution with the predictions produced by the heuristics. If the hypothesis is supported, then the door is open for the development of machines that can vary execution discipline to increase performance. DOE

THE LIMITS OF INTELLIGENCE IN DESIGN
K. Papamichael and J. P. Protzen May 1993 10 p Presented at the 4th International Symposium on System Research, Informatics and Cybernetics, Baden-Baden, Germany, 3-4 Aug. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC03-76SF-00098)
(DE94-004668; LBL-31742; CONF-9308203-1) Avail: Issuing Activity (Department of Energy (DOE))

A new, comprehensive design theory is presented, applicable to all design domains such as engineering and industrial design, architecture, city and regional planning, and, in general, any goal-oriented activity that involves decision making. The design process is analyzed into fundamental activities that are characterized with respect to the nature of knowledge requirements and the degree to which they can be specified and delegated to others, in general, and to computers in particular. The characterization of design problems as 'wicked', or 'ill-defined', design has been understood as a rational activity, that is 'thinking before acting'. The new theory presented in this paper suggests that design is 'thinking and feeling while acting', supporting the position that design is only partially rational. Intelligence, 'natural' or 'artificial', is only one of two requirements for design, the other being emotions. Design decisions are only partially inferred, that is, they are not entirely the product of reasoning. Rather, design decisions are based on judgment that requires the notion of 'good' and 'bad', which is attributed to feelings, rather than thoughts. The presentation of the design theory extends to the implications associated with the limits of intelligence in design, which, in turn, become constraints on the potential role of computers in design. Many of the current development efforts in computer-aided design violate these constraints, especially in the implementation of expert systems and multi-criterion evaluation models. These violations are identified and discussed in detail. Finally, specific areas for further research and development in computer-aided design are presented and discussed. DOE

DEVELOPING A PERSONAL-COMPUTER-BASED RECORDS RETENTION SYSTEM USING PARADOX(TM)
B. Sprouse and S. Wray Oct. 1993 9 p Presented at the 38th Association of Records Managers and Administrators (ARMA) Annual Meeting, Seattle, WA, 17-20 Oct. 1993
(Contract DE-AC06-87RL-10930)
(DE94-007984; WHC-SA-1705; CONF-9310300-1) Avail: CASI HC A02/MF A01

Many records managers are confronted with large caches of records stored in corners, attics, or warehouses that seem to be 'out of sight, out of mind.' Much of this information becomes 'lost' because it is not properly identified and cataloged. Perhaps the records have always been stored in

these places because the lack of an alternative. In these situations, the records manager must organize and catalog the records and provide solutions to the records management and storage problems. A simple personal computer-based records management system can be developed that will provide organization, accountability, and retrievability of the records. By developing a basic database structure and implementing some basic records management principles, a records manager can gain control of even the most extreme displays of records mismanagement. This paper will discuss practical ways of establishing a records system that provides for database tracking using off-the-shelf database software packages. Database examples using Paradox software will be used to explain the basic concepts for developing records systems. The paper will also discuss developing and performing a records assessment, researching applicable requirements, writing a records management plan, implementing the records system, and testing and modifying the system. ON THE USE OF COMPUTERS FOR TEACHING FLUID MECHANICS

Thomas J. Benson Jun. 1994 18 p Proposed for presentation at the ASME Fluids Engineering Division Summer Meeting, Lake Tahoe, NV, 19-23 Jun. 1994; sponsored by ASME

(RTOP 505-62-52)

(NASA-TM-106587; E-8851; NAS 1.15:106587) Avail: CASI HC A03/MF A01

Several approaches for improving the teaching of basic fluid mechanics using computers are presented. There are two objectives to these approaches: to increase the involvement of the student in the learning process and to present information to the student in a variety of forms. Items discussed include: the preparation of educational videos using the results of computational fluid dynamics (CFD) calculations, the analysis of CFD flow solutions using workstation based post-processing graphics packages, and the development of workstation or personal computer based simulators which behave like desk top wind tunnels. Examples of these approaches are presented along with observations from working with undergraduate co-ops. Possible problems in the implementation of these approaches as well as solutions to these problems are also discussed. Author (revised)

MODEL-BASED RECONFIGURATION: DIAGNOSIS AND RECOVERY Final Report

Judy Crow and John Rushby Hampton, VA NASA May 1994 66 p

(Contract NAS1-18226; RTOP 505-64-50-04)

(NASA-CR-4596; NAS 1.26:4596) Avail: CASI HC A04/MF A01

We extend Reiter's general theory of model-based diagnosis to a theory of fault detection, identification, and reconfiguration (FDIR). The generality of Reiter's theory readily supports an extension in which the problem of reconfiguration is viewed as a close analog of the problem of diagnosis. Using a reconfiguration predicate 'rcfg' analogous to the abnormality predicate 'ab,' we derive a strategy for reconfiguration by transforming the corresponding strategy for diagnosis. There are two obvious benefits of this approach: algorithms for diagnosis can be exploited as algorithms for reconfiguration and we have a theoretical framework for an integrated approach to FDIR. As a first step toward realizing these benefits we show that a class of diagnosis engines can be used for reconfiguration and we discuss algorithms for integrated FDIR. We argue that integrating recovery and diagnosis is an essential next step if this technology is to be useful for practical applications. Author (revised)

BUCKY INSTRUCTION MANUAL, VERSION 3.3

James P. Smith May 1994 61 p

(NASA-TM-104793; S-766; NAS 1.15:104793) Avail: CASI HC A04/MF A01

The computer program BUCKY is a p-version finite element package for the solution of structural problems. The current version of BUCKY solves the 2-D plane stress, 3-D plane stress plasticity, 3-D axisymmetric, Mindlin and Kirchoff plate bending, and buckling problems. The p-version of the finite element method is a highly accurate version of the traditional finite element method. Example cases are presented to show the accuracy and application of BUCKY. Author

TRANSLATING AN AI APPLICATION FROM LISP TO ADA: A CASE STUDY

Gloria J. Davis Nov. 1991 7 p

(RTOP 549-03-61)

(NASA-TM-103845; A-91094; NAS 1.15:103845) Avail: CASI HC A02/MF A01

A set of benchmarks was developed to test the performance of a newly designed computer executing both Lisp and Ada. Among these was AutoClassII -- a large Artificial Intelligence (AI) application written in Common Lisp. The extraction of a representative subset of this complex application was aided by a Lisp Code Analyzer (LCA). The LCA enabled rapid analysis of the code, putting it in a concise and functionally readable form. An equivalent benchmark was created in Ada through manual translation of the Lisp version. A comparison of the execution results of both programs across a variety of compiler-machine combinations indicate that line-by-line translation coupled with analysis of the initial code can produce relatively efficient and reusable target code. A SOFTWARE ARCHITECTURE FOR MULTIDISCIPLINARY APPLICATIONS: INTEGRATING TASK AND DATA PARALLELISM Final Report

Barbara Chapman (Wien Univ., Austria.), Piyush Mehrotra, John VanRosendale, and Hans Zima Mar. 1994 26 p Submitted for publication

(Contract NAS1-19480; FWF-P8989-PHY; BMWF-GZ-308.9281-IV/3/93; RTOP 505-90-52-01)

(NASA-CR-194896; NAS 1.26:194896; ICASE-94-18) Avail: CASI HC A03/MF A01

Data parallel languages such as Vienna Fortran and HPF can be successfully applied to a wide range of numerical applications. However, many advanced scientific and engineering applications are of a multidisciplinary and heterogeneous nature and thus do not fit well into the data parallel paradigm. In this paper we present new Fortran 90 language extensions to fill this gap. Tasks can be spawned as asynchronous activities in a homogeneous or heterogeneous computing environment; they interact by sharing access to Shared Data Abstractions (SDA's). SDA's are an extension of Fortran 90 modules, representing a pool of common data, together with a set of Methods for controlled access to these data and a mechanism for providing persistent storage. Our language supports the integration of data and task parallelism as well as nested task parallelism and thus can be used to express multidisciplinary applications in a natural and efficient way. MESH OPTIMIZATION

Hughes Hoppe, Tony DeRose, Tom Duchamp, John McDonald, and Werner Stuetzle 1994 35 p

(Contract DE-FG06-85ER-25006; NSF CCR-89-57323)

(AD-A277644; TR-93-01-01) Avail: CASI HC A03/MF A01

We present a method for solving the following problem: Given a set of data points scattered in three dimensions and an initial triangular mesh M(sub O), produce a mesh M, of the same topological type as M(sub O), that fits the data well and has a small number of vertices. Our approach is to minimize an energy function that explicitly models the competing desires of conciseness of representation and fidelity to the data. We show that mesh optimization can be effectively used in at least two applications: surface reconstruction from unorganized points and mesh simplification (the reduction of the number of vertices in an initially dense mesh of triangles). MACHINE ASSISTED IMPLEMENTATION OF COMPLEX ALGORITHMS AND LABOR INTENSIVE SOFTWARE, CLOSING REPORT

Robert A. Paige 22 Feb. 1994 5 p

(Contract N00014-90-J-1890)

(AD-A277662) Avail: CASI HC A01/MF A01

Our project stated the following broad goals: (1) to design a practical tool capable of automating major aspects of programming--essentially, a generalization of YACC and MACSYMA to facilitate implementation of a wide class of complex nonnumerical algorithms (in addition to parsing); (2) to design and implement complexity based specification languages; (3) to integrate problem specification, program design, verification, and analysis within a single unified framework; (4) to design and efficiently implement pattern directed rule systems for semantic analysis; and (5) to make it easier to teach and understand algorithms and software engineering. SynRGen: AN EXTENSIBLE FILE REFERENCE GENERATOR

Maria R. Ebling and M. Satyanarayanan Feb. 1994 16 p

(Contracts F33615-90-C-1465; F19628-93-C-0193)

(AD-A277678; CMU-CS-94-119) Avail: CASI HC A03/MF A01

SynRGen, a synthetic file reference generator operating at the system call level, is capable of modeling a wide variety of usage environments. It achieves realism through trace-inspired micromodels and flexibility by combining these micromodels stochastically. A micromodel is a parameterized piece of code that captures the distinctive signature of an application. We have used SynRGen extensively for stress testing the Coda File System. We have also performed a controlled experiment that demonstrates SynRGen's ability to closely emulate real users-within 20% of many key system variables. In this paper we present the rationale, detailed design, and evaluation of SynRGen and mention its applicability to broader uses such as performance evaluation. DTIC

THEORY AND APPLICATION OF IMAGE ENHANCEMENT Final Report

Michael G. Ellis, Sr. and Roy L. Campbell, Jr. Feb. 1994 467 p

(AD-A277896; WES/TR/ITL-94-1) Avail: CASI HC A20/MF A04

The conventional methods for image enhancement cannot be satisfactorily applied to the restoration of many types of images. This report explores standard image enhancement algorithms with emphasis on possible extensions to allow for real-time applications. The artifacts introduced by compression algorithms can often be compensated for by proper restoration techniques. A desktop conferencing system is prototyped in this report as a test-bed application to evaluate both real-time compression and real-time enhancement algorithms. DTIC

TRANSFORMATION OF TWO AND THREE-DIMENSIONAL REGIONS BY ELLIPTIC SYSTEMS Final Report

C. Wayne Mastin 4 May 1994 30 p

(Grant NsG-1577)

(NASA-CR-195849; NAS 1.26:195849) Avail: CASI HC A03/MF A01

Several reports are attached to this document which contain the results of our research at the end of this contract period. Three of the reports deal with our work on generating surface grids. One is a preprint of a paper which will appear in the journal Applied Mathematics and Computation. Another is the abstract from a dissertation which has been prepared by Ahmed Khamayseh, a graduate student who has been supported by this grant for the last two years. The last report on surface grids is the extended abstract of a paper to be presented at the 14th IMACS World Congress in July. This report contains results on conformal mappings of surfaces, which are closely related to elliptic methods for surface grid generation. A preliminary report is included on new methods for dealing with block interfaces in multiblock grid systems. The development work is complete and the methods will eventually be incorporated into the National Grid Project (NGP) grid generation code. Thus, the attached report contains only a simple grid system which was used to test the algorithms to prove that the concepts are sound. These developments will greatly aid grid control when using elliptic systems and prevent unwanted grid movement. The last report is a brief summary of some timings that were obtained when the multiblock grid generation code was run on the Intel IPSC/860 hypercube. Since most of the data in a grid code is local to a particular block, only a small fraction of the total data must be passed between processors. The data is also distributed among the processors so that the total size of the grid can be increase along with the number of processors. This work is only in a preliminary stage. However, one of the ERC graduate students has taken an interest in the project and is presently extending these results as a part of his master's thesis. Author (revised)

USE AND ADMINISTRATION OF UNIX (TM) SYSTEMS [UTILISATION ET ADMINISTRATION DES SYSTEMES UNIX]

Christian Pelissier 1992 278 p In FRENCH

(ISSN 0078-3781)

Avail: CASI HC A13/MF A03

The first part of this paper presents the Unix system from a user stand point. It concerns beginners, developers, and system administrators. Most of the commands are discussed and illustrated with examples. Others, because of their importance, are explained in detail. These are Shell and C-shell interpreters, the Make and SCCS utilities, the vi text editor and the mail utility. The second part describes system administration. It discusses the various aspects of this specialty beginning with the most elementary operations such as how to declare users and devices. The network is not forgotten since it covers TCP/IP, NFS, NIS, electronic mail, UUCP, and X-Window. System security is developed in the last chapter. The Unix versions covered in this paper are AT&T System 5 R2 and R3 as well as BSD 4.2 and 4.3 through the particular implementation of computer manufacturers. Author (revised)

ON THE MINIMUM OF INDEPENDENT GEOMETRICALLY DISTRIBUTED RANDOM VARIABLES Final Report

Gianfranco Ciardo (College of William and Mary, Williamsburg, VA.), Lawrence M. Leemis (College of William and Mary, Williamsburg, VA.), and David Nicol (College of William and Mary, Williamsburg, VA.) Mar. 1994 18 p Submitted for publication

(Contract NAS1-19480; RTOP 505-90-52-01)

(NASA-CR-194883; NAS 1.26:194883; ICASE-94-12) Avail: CASI HC A03/MF A01

The expectations E(X(sub 1)), E(Z(sub 1)), and E(Y(sub 1)) of the minimum of n independent geometric, modifies geometric, or exponential random variables with matching expectations differ. We show how this is accounted for by stochastic variability and how E(X(sub 1))/E(Y(sub 1)) equals the expected number of ties at the minimum for the geometric random variables. We then introduce the 'shifted geometric distribution' and show that there is a unique value of the shift for which the individual shifted geometric and exponential random variables match expectations both individually and in the minimums. MULTIPLE-VALUED PROGRAMMABLE LOGIC ARRAY MINIMIZATION BY SOLUTION SPACE SEARCH M.S. Thesis

Charles G. Wendt Dec. 1993 60 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(AD-A278033) Avail: CASI HC A04

A minimal realization of a multiple-valued programmable logic array

can only be achieved by exhaustive search. However, an exhaustive search is unrealistic even with the high speed CPU's in use today. Heuristic algorithms have been developed that provide near-minimal solutions using significantly less CPU time. This thesis investigates a new type of heuristic that uses implicant operations (combine, reshape, and cut) to move through the solution space. The choice of move is dynamically controlled by feedback from a queue of previous moves, called a TABU queue. This new heuristic performs better than existing heuristics in certain situations, but it requires more CPU time than direct cover methods. in addition, this heuristic provides a unique capability to fix the move acceptance probabilities associated with the basic implicant operations. Fixing move acceptance probabilities allows a study of the solution space of multiple-valued logic functions under controlled conditions. For example, tile results of a preliminary study into the solution space of a four-valued, three variable special function (SF) are presented. This suggests that the search space is not homogeneous; rather it suggests that the space is segmented with restrictive access between segments. The results of such studies will be a basis for improving the performance of current and future minimization heuristics. DTIC

SELECTION CRITERIA AND FACILITATION TRAINING FOR THE STUDY OF GROUPWARE Final Technical Report
Barry P. Robichaux (Houston Univ., TX.) Nov. 1993 45 p
(Contract NCC9-16; RICIS Proj. IR-01b)
(NASA-CR-195906; NAS 1.26:195906) Avail: CASI HC A03/MF A01

Computer support for planning and decision making groups is a growing trend in the 90s. Groupware is a name often applied to group software and has been defined as 'computer-based systems that support groups engaged in a common task (or goal) and that provide an interface to a shared environment'. Unlike most single-user software, groupware assists user groups in their collaboration, coordination, and communication efforts. This paper focuses on groupware to support the meeting process. These systems are often called group decision support systems (GDSS), electronic meeting systems (EMS), or group support systems (GSS). The term 'meeting support groupware' is used here to include any computer-based system to support meetings. In order to understand this technology, one must first understand groups, what they do and the problems they face, and groupware, a wide range of technology to support group work. Guidelines for selecting groups for study as part of an overall research plan are provided in this document. These were taken from the literature and from persons for whom the information in this paper was targeted. Also, guidelines for facilitation training are discussed. Familiarity with known and accepted techniques are the principle duties of the facilitator and any form of training must include practice in using these techniques. Derived from text

MIXED 0-1 PROGRAMMING BY LIFT-AND-PROJECT IN A BRANCH-AND-CUT FRAMEWORK
Egon Balas, Sebastian Ceria, and Gerard Cornuejols 25 Feb. 1994 38 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-89-J-1063; NSF DDM-92-01340)
(AD-A278045; MSRR-603) Avail: CASI HC A03

We investigate the computational issues that need to be addressed when incorporating general cutting planes for mixed 0-1 programs into a branch-and-cut framework. The cuts we use are of the lift-and-project variety. Some of the issues addressed have a theoretical answer but others are of an experimental nature and are settled by comparing alternatives on a set of test problems. The resulting code is a robust solver for mixed 0-1 programs. We compare it with several existing codes. DTIC

STRUCTURING Z SPECIFICATIONS WITH VIEWS
Daniel Jackson Mar. 1994 27 p
(Contract F33615-93-1-1330; NSF CCR-93-08726)
(AD-A277618; CMU-CS-94-126) Avail: CASI HC A03/MF A01

A view is a partial specification of a program, consisting of a state space and a set of operations. A full specification is obtained by composing several views and linking them through their states (by asserting invariants across views) and through their operations (by defining external operations as combinations of operations from different views). By encouraging multiple representations of the program's state, view structuring lends clarity and terseness to the specification of operations. And by separating different aspects of functionality, it brings modularity at the grossest level of organization, so that specifications can accommodate change more gracefully. View structuring in Z is demonstrated with a few small examples. The features of Z that make it especially well suited to composing views are discussed, along with some hints for adapting other languages to the purpose. DTIC

Ada SUPPORT FOR THE MATHEMATICAL FOUNDATIONS OF SOFTWARE ENGINEERING Final Report
John Beidler 16 Nov. 1993 40 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DAAL03-92-G-0410)
(AD-A278031) Avail: CASI HC A03

Three topics were selected as targets for this project: program correctness, finite state devices, and program complexity (timing). A variety of artifacts were developed to support course material, programming assignments, and laboratory assignments in the mathematics of software engineering. The program correctness artifact centers on an artifact, called Assert. Assert is an Ada package that assists users in testing program

assertions. The finite state device target is supported by several artifacts. One artifact in a course module, with laboratory and programming assignments, centers on the use of finite state device concepts in programming and the classical representations of finite state devices in Ada. The second finite state device artifact is a Turing Machine simulator that simulates a Turing machine with from one to three tapes. The timing target centered on generalizations of the classical Towers of Hanoi problem. The traditional Towers of Hanoi problem appears in many computing texts as a recursion example. Our study of the Towers of Hanoi problem led to the observation that there is no formal proof for the Towers of Hanoi problem when more than three spindles are used. This problem lends itself to substantial experimentation among the students as they compete to develop the program with the best timing results. All software developed through this grant has been forwarded for inclusion in the Public Ada Library (PAL) DTIC

IMPLANTING ALGORITHMS ON PARALLEL MACHINES [IMPLANTATION D'ALGORITHMES SUR MACHINES PARALLELES]
Jesus Sanchez Oct. 1993 84 p In FRENCH Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 1242-1345)
(TELECOM-93-D-017; ETN-94-95891) Avail: CASI HC A05

The implanting of algorithms on parallel machines necessitates knowledge of the algorithm and, more markedly than for sequential machines, of the target architecture. The adequation between the algorithm and the architecture is fundamental for obtaining performant implantations. A greedy approach consisting of using the most resources possible (processors, communication links, buses, etc.) of the parallel machines, that is, to 'parallelize' the algorithm to the maximum, can bring an important improvement in the calculation time caused by problems due to the communication, synchronization between processors, etc. The hardware and software on which implantation is to take place must therefore be well understood. The characteristics of the different hardware topologies normally used by parallel machine builders are described, and criteria to use to compare them are addressed. The software part of implantations is addressed, describing the principal programming languages used in parallel machines and the different existing interprocessor mechanisms. ESA

SANDIA'S RESEARCH NETWORK FOR SUPERCOMPUTING 1993: A DEMONSTRATION OF ADVANCED TECHNOLOGIES FOR BUILDING HIGH-PERFORMANCE NETWORKS
S. A. Gossage and M. O. Vahle Dec. 1993 18 p
(Contract DE-AC04-94AL-85000)
(DE94-005319; SAND-93-3807) Avail: CASI HC A03/MF A01

Supercomputing '93, a high-performance computing and communications conference, was held November 15th through 19th, 1993 in Portland, Oregon. For the past two years, Sandia National Laboratories has used this conference to showcase and focus its communications and networking endeavors. At the 1993 conference, the results of Sandia's efforts in exploring and utilizing Asynchronous Transfer Mode (ATM) and Synchronous Optical Network (SONET) technologies were vividly demonstrated by building and operating three distinct networks. The networks encompassed a Switched Multimegabit Data Service (SMDS) network running at 44.736 megabits per second, an ATM network running on a SONET circuit at the Optical Carrier (OC) rate of 155.52 megabits per second, and a High Performance Parallel Interface (HIPPI) network running over a 622.08 megabits per second SONET circuit. The SMDS and ATM networks extended from Albuquerque, New Mexico to the showroom floor, while the HIPPI/SONET network extended from Beaverton, Oregon to the showroom floor. This paper documents and describes these networks. DOE

THE ANT SYSTEM: AN AUTOCATALYTIC OPTIMIZING PROCESS

Marco Dorigo, Vittorio Maniezzo, and Alberto Colorni Sep. 1993 37 p (Rept-91-016-Rev; ETN-94-95802) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

An analogy with the way ant colonies function suggested the definition of a new computational paradigm, called the 'ant system'. It is proposed as a viable approach to stochastic combinatorial optimization. The main characteristics of this model are positive feedback and distributed computation, together with the use of a constructive greedy heuristic. Positive feedback accounts for rapid discovery of good solutions, distributed computation avoids premature convergence, and the greedy heuristic helps the procedure to find acceptable solutions in the early stages of the search process. The proposed methodology is applied to the classical traveling salesman problem, and simulation results are reported. The working of the algorithm is discussed, and it is compared with tabu search and simulated annealing in the case of the traveling salesman problem. It is shown how the ant system can be applied to other optimization problems like the asymmetric traveling salesman, the quadratic assignment, and job shop scheduling. ESA

A PROBABILISTIC VIEW OF DATALOG PARALLELIZATION

Sergio Lifschitz and Victor Vianu 1993 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Grants CAPES/MEC-1245/90-13; NSF IRI-92-21268) (ISSN 0751-1353) (TELECOM-93-D-021; ETN-94-95894) Avail: Issuing Activity (European Space Agency (ESA))

A pure parallelization strategy applicable to all Datalog programs is proposed. Since completeness is not guaranteed, a complementary single processor evaluation step has to be foreseen, which can be very costly in some cases. However, it is shown that in most cases, the global performance of the algorithm (including complementary step) is excellent. This is justified by a probabilistic analysis of the behavior of the algorithm and by results of implantations on randomly generated data. It is considered that any information on the data base is available and therefore, that every instance holds. In practice this is not always true. In this case for more structured data, the strategy no longer presents a good behavior. With more information on the data, adaptations must be foreseen so that good performances can be attained. ESA

SCHEDULING TECHNIQUES FOR MULTIPLE PROCESSOR SYSTEMS IN REAL-TIME ENVIRONMENTS M.S. Thesis

John H. Quigg Sep. 1993 76 p

(AD-A276149) Avail: CASI HC A05/MF A01

Directed Acyclic Graph Scheduling is a technique used to implement the real-time execution of Digital Signal Processing applications on multiple-processor data-flow machines that support variable-grained parallelism. The approach used in the Navy's AN/UYS-2 Digital Signal Processor statically schedules an application graph at run-time using a First-Come-First-Served (FCFS) policy. Research by Shukla and Zaky Shukla 91 developed a new algorithm, the Revolving Cylinder (RC), to ameliorate the inherently non-deterministic output flow of the FCFS scheduling approach currently used in the system. Although the RC technique solved the problem of output-flow determinism there was no broad coverage of other current research in the very specialized field of real-time data-flow machines. This thesis reviews Revolving Cylinder analysis and then surveys, compares, and evaluates research in the field using the review as a baseline for comparison. The RC approach is best at improving the throughput and output flow determinism of a narrow range of applications on a particular architecture. Each of the other approaches offer improvements over RC scheduling in either performance as measured by throughput or through flexibility in applications handled. For each of these improvements, however, significant trade-offs are made and so improvements become relative when they affect system robustness and an ability to handle repeated execution of application graphs. The AN/UYS-2 can implement RC scheduling with a minimum of cost and no hardware reconfiguration and this makes it the best approach for short-term system. DTIC

LIST RANKING AND LIST SCAN ON THE CRAY C-90

Margaret Reid-Miller and Guy E. Blelloch 16 Feb. 1994 37 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract F33615-93-1-1330; NSF CCR-92-58525)

(AD-A276411; CMU-CS-94-101) Avail: CASI HC A03

List ranking and list scan are two primitive operations used in many parallel algorithms that use list, trees, and graph data structures. But vectorizing and parallelizing list ranking is a challenge because it is highly communication intensive and dynamic. In addition, the serial algorithm is very simple and has very small constants. In order to compete a parallel algorithm must also be simple and have small constants. A parallel algorithm due to Wyllie is such an algorithm, but it is not work efficient -- its performance degrades for longer and longer linked lists. In contrast, work efficient PRAM algorithms developed to date have very large constants. We introduce a new fully vectorized and parallelized algorithm that is both work efficient and has small constants. However, it does not achieve O(log n) running time. But we contend that work efficiency and small constants is more important, given that vector and multiprocessor machines are used for problems that are much larger than the number of processors and, therefore, the O(log n) time is never achieved in practice. In particular, to the best of our knowledge our implementation of list ranking and list scan on the CRAY C-90 is the fastest implementation to date. In addition, it is the first implementation of which we are aware that outperforms fast workstations. DTIC

A mathematical comment on Peper's study on efficient network topologies for extensible massively parallel computers is presented. Peper studied the application of supersymmetric planar graphs as communication networks in massively parallel computers. Essential in such a network is the presence of some simple routing function. A routing function in a network gives for every pair of nodes P and Q a signpost that indicates which way to start for a shortest path from P to Q. Unfortunately, such a routing function is absent in Peper's exposition. By embedding the graph in a hyperbolic plane and applying some simple differential geometry, a routing function is supplied. The same embedding allows for a very concise proof of the theorem that supersymmetric graphs are smooth (that is, contain no extreme nodes). Peper proves this theorem in a combinatorial nonuniform way, considering several cases and subcases. Another detailed combinatorial analysis is found in Peper's derivation of the uniform exponentiality of supersymmetric graphs. The simplification of this derivation by using some hyperbolic geometry is questioned. It turns out that it can be simplified without using hyperbolic geometry. ESA

INVARIANCE OF THE GENERALIZED STEADY-STATE FOR 1-D DISTRIBUTED PARAMETER SYSTEMS
L. Dekker 15 Aug. 1993 19 p
(ISSN 0922-5641)
(Rept-93-66; ETN-94-96111) Copyright Avail: CASI HC A03/MF A01

Invariance is proven for some linear 1-D (one dimensional) distributed parameter systems. Discussions are based upon the use of a mathematical formulation of the generalized steady state as an infinite series expansion of the time derivatives of the two corner input signals. This formulation, together with the property of decomposition invariance, offers easy to exploit massive parallelism. Spatial decomposition invariance is considered for 1-D diffusion systems. The boundary conditions of the diffusion system are conceived to be corner input signals forcing a uniquely defined 2-corner generalized steady state onto the diffusion system. It is proven that this 2-corner generalized steady state has the property to be invariant under spatial system decomposition. Spatial decomposition invariance of the generalized steady state is further considered for two other 1-D distributed parameter systems of second order in space: a diffusion system with uniformly distributed damping and a convection diffusion system. It is pointed out for the convection diffusion system that the proof used for the diffusion system (without damping) remains valid, because of the structure of this proof, for other 1-D distributed parameter systems. It is also shown, through transformation of a convection diffusion system successively into a diffusion system with damping and then into a diffusion system, that the generalized steady state is invariant under transformation of the state variable. A COMPARISON OF DISTRIBUTED MEMORY AND VIRTUAL SHARED MEMORY PARALLEL PROGRAMMING MODELS
J. A. Keane (Manchester Univ., England.), A. J. Grant (Manchester Univ., England.), and M.-Q. Xu Apr. 1993 16 p Presented at the 4th Meiko User Society Conference, Southampton, England, Apr. 1993
(Contract W-31-109-eng-38)
(DE94-005473; ANL/MCS/CP-81645; CONF-9304227-1) Avail: CASI HC A03/MF A01

The virtues of the different parallel programming models, shared memory and distributed memory, have been much debated. Conventionally the debate could be reduced to programming convenience on the one hand, and high scalability factors on the other. More recently the debate has become somewhat blurred with the provision of virtual shared memory models built on machines with physically distributed memory. The intention of such models/machines is to provide scalable shared memory, i.e. to provide both programmer convenience and high scalability. In this paper, the different models are considered from experiences gained with a number of systems ranging from applications in both commerce and science to languages and operating systems. Case studies are introduced as appropriate. DOE

GENERALIZED STEADY-STATE METHOD FOR SOLVING 2-D DIFFUSION SYSTEMS
L. Dekker 1993 20 p
(ISSN 0922-5641)
(Rept-93-83; ETN-94-96128) Copyright Avail: CASI HC A03/MF A01

Massively parallel modeling of distributed parameter systems through the generalized steady state method is described. This method is explained for one and two dimensional diffusion systems. The arising models are shown to contain explicit parallelism proportional to the physical size of the system. This together with the invariance property under spatial system decomposition makes these models promising for simulation of distributed parameter systems through massively parallel processing. ESA

THE NAMED-STATE REGISTER FILE
Peter R. Nuth Aug. 1993 129 p
(Contract N00014-88-K-0738)
(AD-A276796; AI-TR-1459) Avail: CASI HC A07/MF A02

This thesis introduces the Named-State Register File (NSF), a fine-grain, fully-associative register file. The NSF allows fast context switching between concurrent threads as well as efficient sequential program performance. The NSF holds more live data than conventional register files, and it requires less spill and reload traffic to switch between contexts. This thesis demonstrates an implementation of the Named-State Register File and estimates the access time and chip area required for different organizations. Architectural simulations of large sequential and parallel applications show that the NSF can reduce execution time by 9% to 17% compared to alternative register files. DTIC

(Grant NF-63/62-518)
(TR-93-20; ETN-94-96214) Avail: Issuing Activity (European Space Agency (ESA))

A framework for the derivation of programs for arbitrary (in particular, parallel) architectures, motivated by a generalization of the derivation process for sequential algorithms is described. The central concept in this approach is that of a skeleton: on the one hand, a higher order function for targeting transformational derivations, and, on the other hand, representing an elementary computation on the intended architecture. Skeletons thus form a basis for intermediate languages, that can be implemented once and for all, as a process separate from individual program developments. The

available knowledge on the derivation of (higher order) functional programs can be used for deriving parallel ones. The method is reviewed and illustrated with an example (trapezoidal rule on SIMD processor array). ESA

(Contract W-31-109-eng-38)
(DE94-004696; ANL/IPD/CP-81274; CONF-9311152-1) Avail: CASI HC A03/MF A01

BASISplus is used at the Laboratory by the Technical Information Services (TIS) Department which is part of the Information and Publishing Division at ARGONNE. TIS operates the Argonne Information Management System (AIM). The AIM System consists of the ANL Libraries On-Line Database (a TECHLIBplus database), the Current Journals Database (IDI's current contents search), the ANL Publications Tracking Database (a TECHLIBplus database), the Powder Diffraction File Database, and several CD-ROM databases available through a Novell network. The AIM System is available from the desktop of ANL staff through modem and network connections, as well as from the 10 science libraries at ARGONNE. TIS has been a BASISplus and TECHLIBplus site from the start, and never migrated from BASIS K. The decision was made to migrate from the VAX/VMS platform to a UNIX platform. Migrating a product from one platform to another involves many decisions and considerations. These justifications, decisions, and considerations are explored in this report. DOE

PARALLEL PROCESSING FOR DIFFERENCING AND HISTOGRAMMING
Vaughan Clarkson and Pinaki S. Ray Oct. 1993 32 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A277060; ERL-0692-RR; DODA-AR-008-135) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Algorithms which take advantage of massively parallel and vector architectures are formulated for the calculation of the differences of times-of-arrival derived from a sequence of time samples. The application which generated the work is the classification of pulse trains which are detected by an electronic support measures receiver. Four algorithms are proposed, of which three have been implemented and tested on several machines. The results obtained through testing are compared with each other and with results for more conventional architectures. It is found that one of the machines, the massively parallel MASPAR MP-1 computer, is able to perform histogramming fastest through exploitation of its data-parallel architecture. Several suggestions are made which could significantly improve performance on all architectures. DTIC

VME ROLLBACK HARDWARE FOR TIME WARP MULTIPROCESSOR SYSTEMS Final Report

Michael J. Robb and Calvin A. Buzzell 25 Sep. 1992 51 p
(Contract NAS7-1102; SBIR-06.08-4448)
(NASA-CR-191796; NAS 1.26:191796) Avail: CASI HC A04/MF A01

The purpose of the research effort is to develop and demonstrate innovative hardware to implement specific rollback and timing functions required for efficient queue management and precision timekeeping in multiprocessor discrete event simulations. The previously completed phase 1 effort demonstrated the technical feasibility of building hardware modules which eliminate the state saving overhead of the Time Warp paradigm used in distributed simulations on multiprocessor systems. The current phase 2 effort will build multiple pre-production rollback hardware modules integrated with a network of Sun workstations, and the integrated system will be tested by executing a Time Warp simulation. The rollback hardware will be designed to interface with the greatest number of multiprocessor systems possible. The authors believe that the rollback hardware will provide for significant speedup of large scale discrete event simulation problems and allow multiprocessors using Time Warp to dramatically increase performance. GIGABITS TO THE DESKTOP: INSTALLING TOMORROW'S NETWORKS TODAY
Timothy C. Kuhfuss and Paul T. Phillips 1994 20 p Presented at the International Conference on Advanced Science and Technology, Naperville, IL, 1 Mar. 1994
(Contract W-31-109-eng-38)
(DE94-007701; ANL/ECT/CP-82125; CONF-940377-1) Avail: CASI HC A03/MF A01

Argonne is one of the US Department of Energy's world class research institutions. Leading edge computing tools and networks allow Argonne to maintain and enhance this reputation. One current effort to deploy leading edge tools is the Argonne 'Gigabits to the Desktop' project. While the delivering and using gigabits to the desktop is little more than a hope at this time, this paper discusses the hurdles to achieving it and how to tear down as many hurdles as possible. Under this project, four distinct areas are being investigated and enhanced. This paper discusses briefly the applications and tools that we see driving the requirement for gigabits to the desktop. It will touch on a functional description of our ideal workstations, architectures and the candidates for the next generation network capable of delivering gigabits. Lastly, it provides an in-depth analysis of physical layer options and attempt to prove that this area, while the least risky, must be done properly, with the proper media. This paper assumes one important point. It assumes that bandwidth is essentially free. We discuss network architectures and physical installation recommendations which have a fixed cost. However, on a campus, there is no marginal cost for additional packets on these networks once the network infrastructure is installed. This point is important when extrapolating our conclusions to the wide area. The marginal cost of a packet sent to a commercial network is usually nonzero. This fact may prove to be a great hindrance in migrating the applications mentioned beyond the organizational boundaries. DOE

(DE94-007061; IS-T-1704) Avail: Issuing Activity (Department of Energy (DOE))

One of the most significant advances in computer systems over the past decade is parallel processing. To be scalable to a large number of processing nodes and to be able to support multiple levels and forms of parallelism and its flexible use, new parallel machines have to be multicomputer architectures that have general networking support and extremely low internode communication latencies. The performance of a program when ported to a parallel machine is limited mainly by the internode communication latencies of the machine. Therefore, the best parallel applications are those that seldom require communications which must be routed through the nodes. Thus the ratio of computation time to that of communication time is what determines, to a large extent, the performance metrics of an algorithm. The cost of synchronization and load imbalance appear secondary to that of the time required for internode communication and I/O, for communication intensive applications. This thesis is organized in chapters. The first chapter deals with the communication strategies in various message-passing computers. A taxonomy of inter-node communication strategies is presented in the second chapter and a comparison of the strategies in some existing machines is done. The implementation of communication in nCUBE Vertex O.S is explained in the third chapter. The fourth chapter deals with the communication routines in the Vertex O.S, and the last chapter explains the development and implementation of the scalar communication call. Finally some conclusions are presented. DOE

In the first part of the report, we give a detailed description of an operational semantics for a large subset of VHDL, the VHSIC Hardware Description Language. The semantics is written in the functional language Caliban, similar to Haskell, used by the theorem prover Clio. We also describe a translator from VHDL into Caliban semantics and give some examples of its use. In the second part of the report, we describe our experience in using the VHDL semantics to try to verify a large VHDL design. We were not able to complete the verification due to certain complexities of VHDL which we discuss. We propose a VHDL verification method that addresses the problems we encountered but which builds on the operational semantics described in the first part of the report. Author

(AD-A277422) Avail: CASI HC A02/MF A01

Generally, the routers that are used in state-of-the-art parallel computers are a form of oblivious router known as demonstration order routers. Examples include the iPSC/2, nCUBE, DELTA, Paragon, Dash, J-Machine, etc. In networks based on these routers, all packets between source S and destination D take a single path, oblivious to network congestion and faults. This can lead to the following: poor performance under high loads when congestion can be significant; and system failure in large or unmaintainable systems where faults are likely. For these two reasons--performance and dependability--adaptive routing techniques have long been advocated. Adaptive routers can be divided into two broad classes, minimal adaptive, in which packets always take a shortest path to their destinations, and nonminimal adaptive, in which packet routes are not restricted to shortest paths. Though there have been many proposals for both types, it is generally true that nonminimal adaptive routers are superior minimal adaptive routers. This is consistent with one's intuition. Although a minimal adaptive router can bypass congestion by sending packets along alternate paths, they discover the congestion too late. That is, when there are no alternate forward paths to choose from, the packet's forward progress is stalled and is now contributing to the congestion. This affect motivates nonminimal adaptive routing in which a packet can back up or deroute, and go around congestion when there are no forward paths. DTIC

An optimal O(log log n) time CRCW-PRAM algorithm for computing all period lengths of a string is presented. Previous parallel algorithms compute the period only if it is shorter than half of the length of the string. The

algorithm can be used to find all initial palindromes of a string in the same time and processor bounds. Both algorithms are the fastest possible over a general alphabet. A lower bound is derived for finding initial palindromes by modifying a known lower bound for finding the period length of a string. When p processors are available the bounds become Theta((n/p) + log log(sub (1 + p)/n) 2p). ESA

This has been a three-part project: (1) enhancing generalized discovery tools on our existing computer platform, (2) building specialized discovery tools, and (3) applying generalized and specialized discovery tools to specific materials related projects including protein studies and crystallography. During the work, we have had the opportunity to incorporate some of our other activities, including studies we have done in biomedical fields using our discovery system. We have also folded in some of our external work in design. Portions of this other work are included in this report because it serves to illustrate key points we wish to make. This report includes portions of contributions made by our consultants, W. B. Dress and A. G. Jackson. We begin our report with a review of the philosophical aspects of what we call computational theory formation. We then present the computer tool that has been extended as part of this work, the goal of which is to address the issues brought up in the first section. Finally, the three different applications mentioned above are introduced. DTIC

MACHINERY MONITORING AND DIAGNOSTICS USING PSEUDO WIGNER-VILLE DISTRIBUTION AND BACKPROPAGATION NEURAL NETWORK M.S. Thesis
Lloyd H. Jones Sep. 1993 54 p
(AD-A276219) Avail: CASI HC A04/MF A01

Artificial Neural Networks provide a data based approach to problem solving, patterned after neurological systems, which has proven successful on unique and noisy data. The pseudo Wigner-Ville distribution provides an excellent characterization of a stationary or non-stationary input signal by transforming a time signal into a joint time-frequency domain. This characterization provides an energy level associated with any processed characteristic frequency, which when used as an input to an artificial neural network will aide in the detection of location and severity of machinery faults. Research is presented where the union of an artificial neural network, utilizing the highly successful backpropagation paradigm, and the pseudo Wigner-Ville distribution are demonstrated and shown to provide remarkable success as a tool for machinery monitoring. REPORT OF THE 'MATHEMATICAL MODELS FOR NEURAL NETWORKS' COURSE [RAPPORT DU STAGE 'MODELES MATHEMATIQUES POUR RESEAUX DE NEURONES']
Mireille Lefevre (Electricite de France, Chatou.) 1993 28 p In FRENCH Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 1242-1345)
(TELECOM-93-D-019; ETN-94-95892) Avail: CASI HC A03

The training course 'mathematical models for neural networks' aimed to define a mathematical frame for the study of multilayer neural networks, considered as adaptive systems controlled by synaptic matrices. The developments presented are based on mathematical tools such as tensor products, convex analysis, and viability and control theory. The main points emphasized are the definition of an incremental learning algorithm named heavy algorithm, the elaboration of learning algorithms deduced from either gradient, subgradient or Newton methods and the building of special algorithms applied to control process. A GREEN'S FUNCTION APPROACH TO ANALYSING THE EFFECTS OF RANDOM SYNAPTIC BACKGROUND ACTIVITY IN A MODEL NEURAL NETWORK
Paul C. Bressloff Nov. 1993 31 p
(Maths-Rept-A-202; ETN-94-95862) Avail: CASI HC A03/MF A01

The effect of randomly distributed synaptic background activity on the states of self sustained firing in a model neural network with shunting is investigated. Using mean field theory, the steady state of the network is expressed in terms of an ensemble averaged single neuron Green's function. This Green's function is shown to satisfy a matrix equation identical in form to that found in the tight binding alloy model of excitations on a one dimensional disordered lattice. The ensemble averaging is then performed using a coherent potential approximation, thus allowing the steady state firing rate of the network to be determined. The firing rate is found to decrease as the mean level of background activity across the network is increased; a uniform background (zero variance) leads to a greater reduction than a randomly distributed one (nonzero variance). FEASIBILITY AND STABILITY RESULTS FOR CONSTRAINED STABLE GENERALIZED PREDICTIVE CONTROL
J. A. Rossiter, B. Kouvaritakis, and J. R. Gossner Nov. 1993 24 p
(Maths-Rept-A-203; ETN-94-95863) Avail: CASI HC A03/MF A01

Predictive control strategies which handle input and output constraints are considered. The difficulty with these approaches is that, in an attempt to optimize output tracking over a finite horizon, they tend to drive the controls to the constraint limits; this can lead to infeasibility which, in the case of systems with poles and/or zeros outside the unit circle, leads to instability. The necessary and sufficient conditions for feasibility and stability are developed and an algorithm which overcomes finite horizon infeasibility and gives stability and asymptotic tracking is presented. A DIRECT DIGITAL DESIGN FOR A MULTICHANNEL STRUCTURAL TEST SYSTEM USING THE CHARACTERISTIC LOCUS METHOD
J. A. Rossiter, R. W. Pratt, and K. J. Smith Dec. 1993 8 p Sponsored in cooperation with British Aerospace (Military Aircraft) Ltd.
(Grant SERC-GR/G59990)
(Maths-Rept-A-206; ETN-94-95866) Avail: CASI HC A02/MF A01

A direct digital design for multichannel structural test systems, which are used in aerospace and automotive industries to investigate fatigue and vibration properties of structures, is addressed. The direct digital design considered uses the charateristic locus method. The design process for a two input, two output system is described and compared to an earlier analog design which is shown to be unstable when implemented digitally. It was shown that an earlier design carried out in continuous time did not anticipate the effects of discretization and hence an apparently good design in continuous time led to a poor design in discrete time. However, if the design is carried out in discrete time such problems will not arise. It was also shown that design using an approximately exact commutative controller is much easier than a design using a more traditional CL design technique. ESA

ON THE USE OF GENETIC ALGORITHMS TO SOLVE THE TIME-TABLE PROBLEM
Alberto Colorni (Consiglio Nazionale delle Ricerche, Milan, Italy.), Marco Dorigo, and Vittorio Maniezzo Apr. 1992 26 p Revised
(Rept-90-060-Rev; ETN-94-95801) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

The results of an investigation of the possibilities offered by Genetic Algorithms (GA's) to solve the timetable problem are presented. This problem was chosen since it is representative of the class of multiconstrained, NP hard, combinatorial optimization problems with real world application. The model is presented, including the definition of a hierarchical structure for the objective function and the generalized genetic operators which can be applied to matrices representing timetables. The outcomes of the utilization of the implemented system to the specific case of the generation of a school timetable is reported. Two versions of the GA, with and without local search, are compared both to a handmade timetable and to two other approaches based on simulated annealing and tabu search. Results show that GA with local search and tabu search with relaxation both outperform simulated annealing and handmade timetables. ESA

CONCEPTS AND ENVIRONMENT [CONCETTI E AMBIENTE]
Anio O. Arigoni (Bologna Univ., Italy.), Vittorio Maniezzo, and Anna Navarra Apr. 1993 29 p In ITALIAN
(Rept-93-032; ETN-94-95804) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

A review of the principal psychological models proposed to explain the processes of concept formation consequent to interaction with the environment is presented. Only those models which are sufficiently advanced to allow an implementation on computer are reviewed. The objective is to identify fundamental aspects of the theory confronting the development of the cognitive structure in specific systems at the sensorimotor level. Consideration is given to which systems have the best results, in particular for defining new inductive classification and adaptive control algorithms for autonomous robots. ESA

CAMERA-SPACE MANIPULATION WITH NATURAL VISUAL INFORMATION Ph.D. Thesis
Umesh Arvind Korde 1993 159 p
Avail: Univ. Microfilms Order No. DA9328896

Camera-space manipulation is a precise and robust approach to robot hand/eye coordination in practical, three-dimensional situations. The acquisition of visual information necessary for camera-space manipulation has so far been simplified by placing easily detectable visual 'cues' on the objects involved in the task. This work concerns the development of an approach to speedy and precise extraction of visual information from 'natural' features on the objects. This approach invokes asymbiosis between the estimation procedure of camera-space manipulation and image analysis, in which each procedure builds on progressively improving information 'learned' by the other, both during a particular cycle of a repetitive task, and from one task-cycle to the next. The idea was implemented in a three-dimensional automobile wheel-loading task, in which the natural features were circular. The relative locations of video cameras were such that error-propagation from the estimation procedure to object positioning would be near a minimum. The image-analysis procedure developed in this work could respond to the availability of better information. Its speed and precision improved continually with improving accuracy of the estimation procedure. This procedure can be expected to be more suitable for camera-space manipulation than methods based on the Hough transform. Finally, a method to generalize the approach to tasks involving a class of features was proposed and tested. Dissert. Abstr.

SMART ENVIRONMENTAL MONITOR BASED ON NEURAL NETWORKS AND MULTI-SPECTRAL PATTERN RECOGNITION Final Report, Mar. - Sep. 1993
Tai-Wei Lu Sep. 1993 19 p
(Contract DACA76-93-C-0004)
(AD-A276445; TEC-0048) Avail: CASI HC A03/MF A01

In phase 1 of this project, Physical Optics Corporation (POC) accomplished the goal of the original proposal which was to develop and optimize a unique neural network (NN) algorithm that performs rapid spectral signal processing and identification. POC's NN algorithm was tested with extremely noisy Raman spectra from Lawrence Livermore National Laboratory and experimentally showed at least ten times better sensitivity and reliability than conventional spectral signal processing methods. POC built a portable demonstration system with POC's NN and successfully demonstrated real-time spectral signature identification operations. POC proposed, for phase 2 implementation, a holographic optical neural network (HONN) system that is capable of rapid hyperspectral imaging through an acoustic-optic tunable filter (AOTF), real-time spectral feature identification, and mapping. The success of the phase 2 project will make automatic and rapid hyperspectral image analysis and feature location possible. DTIC

AN ACTIVE COMPUTER SUPPORTED MEDIUM FOR DISTRIBUTED PLANNING IN ENTERPRISES Ph.D. Thesis [EIN AKTIVES COMPUTERGESTUETZTES MEDIUM ZUR VERTEILTEN PLANUNG IM UNTERNEHMEN]
Olaf F. Mehlmann 1993 187 p In GERMAN
(ETN-94-95738) Avail: CASI HC A09/MF A02

A computer aided system for supporting cooperative planning processes and active decision making is presented. The computer was regarded as an active medium and communication and coordination processes were used as a theoretical basis of the study in the framework of collaborative work. Intelligence was regarded as a property of a social group, which is developed through interactions of individuals. The enterprise to be planned was regarded as an accommodating, virtual product. The system was designed for automatically identifying unaccommodativeness in quantitative plannings and consequent communication needs. The system was based on the method of quantitative reasoning, which allows fuzzy, probabilistically interpreted interval numbers to be processed and soft interdependencies to be represented. The system was implemented on a personal computer with an object oriented, user friendly interface. ESA

CONTINGENCY-TOLERANT ROBOT MOTION PLANNING AND CONTROL Ph.D. Thesis
Wonyun Choi 1993 144 p
Avail: Univ. Microfilms Order No. DA9326443

This dissertation describes a new approach and enables techniques to build the navigation system of a mobile robot operating in a partially known environment. The main layout of this environment is known in advance, but the locations and shapes of some smaller objects may not be known. Environments of this type include shop-floors, offices, etc. The problem is to automatically determine how the robot should move from one position to another without colliding with objects in the environment. In order to be both efficient and robust, the navigation system should interweave a planning component and reaction component. The planning component should take advantage of available prior knowledge to produce globally efficient plans. However, it should be aware that knowledge may be incomplete and generate lesser-committed plans that leave some freedom of choice at execution time to deal with contingencies. The reaction component should organize the robot's behavior according to both the ongoing plan and the sensory inputs. The main idea underlying the approach proposed in this dissertation is to let the reaction component share some global knowledge of the robot's environment with the planning component. Based on this idea, we have developed a new type of navigation system where the planning component generates a lesser-committed motion plan, called a channel, represented by a sequence of parallelepipedic cells, and the reaction component uses artificial potential fields to pull the robot toward its goal within the channel, while repelling it away from unexpected obstacles. Various arrangements of unexpected obstacles may be encountered during navigation. The treatment of these arrangements by the reaction component is organized in three layers: channel navigation, local replanning, and global replanning. The most common and simpler cases are processed by the first layer using less complex techniques, while less frequent but more complex cases are handled by the other layers using more complex techniques. This navigation system applies to mobile robots with holonomic or nonholonomic constraints. Three versions of the system have been implemented. They have been experimented with simulated robots and a real mobile robot. Experimental results are discussed in this report. Dissert. Abstr.

ADAPTIVE OPERATING SYSTEMS CONCEPTS Ph.D. Thesis [ADAPTIVE BETRIEBSSYSTEMKONZEPTE]
Andreas Heck 1991 225 p In GERMAN
(ETN-94-95754) Avail: CASI HC A10/MF A03

A model for an adaptive computer operating system which adapts to the respective requirements in a flexible and simple way is presented. The concept of adaptivity is explained, and the status of the research into adaptive operating systems models is described. The support of adaptivity in the structure of an operating system using the developed model is explained. Several adaptive procedures were described within this model. Examples demonstrate the improvements brought about by adaptive systems as compared to static procedures. The model was extended for applications in distributed operating systems. The great flexibility of the concept with respect to adaptations within the operating system is demonstrated. ESA

AN EXPERT SYSTEM ARCHITECTURE FOR HETEROGENEOUS DOMAINS: A CASE-STUDY IN THE LEGAL FIELD Ph.D. Thesis
Robert Frederik Walker 1992 399 p Sponsored by Netherlands Organization for Scientific Research
(ETN-94-96012) Copyright Avail: CASI HC A17/MF A04

EXPANDER (expert system architecture allowing nonhomogeneous distributed knowledge representation), intended to operate in heterogeneous domains where several structurally different sources of knowledge must be combined in order to successfully solve a complex task, is described. It supports a distributed knowledge base in which the knowledge is kept in separate and autonomous modules. The resulting modularity offers considerable flexibility in choosing a range of knowledge representation formalisms and reasoning methods to accommodate domain intricacies. The philosophy behind EXPANDER is to provide extended flexibility: the possibility to tailor an expert system to a particular domain even if this entails the use of many different knowledge representation formalisms and reasoning mechanisms. A global overview of the legal domain is given and the PROLEXS expert system is introduced. The design of a generic expert system architecture is described, and the system is tailored to the legal domain, with emphasis on generic aspects with respect to heterogeneous domains. Implementation aspects are considered. ESA

The author relates some of his experience in the acquisition and use of flexible controllers, and summarizes what he has learned and what a few other people are doing. What the author calls a 'flexible' system could also be called open architecture system. Where one defines OA as the use of well defined and documented software and hardware with interfaces that will permit the system to be modified by the user. Such systems could be based on either accepted or defacto standards for hardware and software. In addition to just sharing the author's experiences, this presentation is appropriate because of the relatively new encouragement that the Laboratory is receiving to work with American industry in the manufacturing area. (ISBN-0-315-87054-0; CTN-94-61243) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Trussarm is a variable geometry truss manipulator concept consisting of double octahedral truss modules. Trussarm changes shape by having hinged joints and three active members or actuators at its midplane. To prove the Trussarm concept, a prototype module was built. In an attempt to improve the control system for the Trussarm, machine vision was chosen to provide it with a method of sensing its workspace. The PAMI-Virtek Vision System from the University of Waterloo, which can track the six free-space coordinates of their special target in real time, was acquired

and adapted to the prototype Trussarm module. A control system for Trussarm was then devised to take advantage of the vision system. This control system was simulated using FORTRAN to prove the concept and then successfully implemented in the laboratory, allowing real-time visual control of the Trussarm for the first time. An artificial neural network was developed to carry out the fusion of stereoscopic vision and shading analysis to reconstruct the depth of an observed scene, starting from two illuminated images which may originate from two cameras. The reconstruction of depth from two dimensional images is an essential step before high level treatments which consist of the recognition and the memorization of the elements in the three dimensional scene observed. The edges contained in each of the two images are first detected. The identical edges in each of the images are then paired by the stereoscopy algorithm and the disparities measured indicate the depth of the scene observed at different edge positions. A shading analysis of one of the images produces an estimate of the relative depth for the slight variations of the exterior surface. A relaxation network combines the two analyses and allows for the obtaining of a dense mesh of depth measurements. CISTI

In the studied problem of tracking and grabbing a moving object with a manipulator guided by a vision system, the motion of the object is unknown and it is not necessarily constrained to the manipulator's attainable workspace. The concept of generalized inverse kinematic functions for prescribed points situated outside of the manipulator workspace is presented. Using this new approach, it is possible to make a real vector of the linkage coordinates correspond to any Cartesian vector of three dimensional space while minimizing the Euclidian distance between the point whose position is given by this vector and the end effector of the manipulator. To control the manipulator, a trajectory planning algorithm is developed. The algorithm is based on a polynomial interpolation preserving continuity of position, velocity, and acceleration along the trajectory of each linkage. A graphic simulator, developed mainly to validate the tracking and trajectory planning algorithms, is also presented. The simulator allows study of any manipulator configuration described with the aid of Hartenberg Denavit parameters. CISTI

TRAJECTORY LEARNING WITH A DIRECT DRIVE ROBOTIC MANIPULATOR Ph.D. Thesis
Nabeel H. Salem 1993 240 p
Avail: Univ. Microfilms Order No. DA9320008

It is common knowledge that human performance of most tasks improves with practice. There is no reason why the same should not be true for robotic manipulators. If an accurate evaluation of task performance can be made, then the performance error can be used to infer command error. The command can then be updated the next time the task is performed in order to obtain an improvement in robot trajectory tracking performance. The key to getting an iterative learning algorithm to converge is the availability of an accurate mathematical model of the robot arm dynamics. Unfortunately, commercial robots, with rare exceptions, are very difficult to model. This is due to the effects of high friction and backlash which are introduced by massive links driven only indirectly through highly-geared motors. In this study, the problems associated with advanced manipulator control due to the lack of suitable experimental manipulators have been mitigated through the use of a high performance custom built arm based on direct drive technology (high torque motors designed to eliminate the need for gears by coupling directly to the robot joint axes). This experimental direct drive manipulator (DDMan) has been used to evaluate our particular learning control ideas. Three iterative learning algorithms have been tested on the DDMan. The first algorithm is based on subtracting the estimate of the command error from the robot command control law in an iterative manner. The other two learning algorithms use optimization techniques to modify the robot model and torque command for the next robot trajectory movement. The experimental results indicates that the robot trajectory tracking accuracy has improved significantly. Numerical simulations are used to examine the learning sensitivity to model parameter errors. Dissert. Abstr.

ADAPTIVE CONTROL OF A ROBOT IN CARTESIAN COORDINATES: ANALYSIS AND IMPLEMENTATION M.S. Thesis [COMMANDE ADAPTIVE DE ROBOT EN COORDONNEES CARTESIENNES: ANALYSE ET REALISATION]
Sylvain Robert Jul. 1993 100 p In FRENCH
(ISBN-0-315-86493-1; CTN-94-61201) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

An analysis is presented of an adaptive controller for trajectory tracking and its real-time implementation on a two degree of freedom SCARA robot. The control law consists of a proportional derivative regulator plus feedforward compensation of the estimated dynamics. The stability of this control scheme can be demonstrated by the Liapunov method, which allows deduction of a law of adaptation of the control parameters. This controller directly utilizes an assigned trajectory expressed in Cartesian coordinates. A conversion to the coordinates of articulation is thereby avoided, which improves the precision and reduces the number of calculations required. The practical implementation of the controller is based on the Motorola DSP96002 microprocessor and a library of programmed floating point matrix functions. Experimental results are reported which validate the theoretical developments and demonstrate the controller performance. Results obtained with a simple proportional derivative controller are also shown for comparison. CISTI

STUDY OF A PATH PLANNING AND TRACKING SYSTEM FOR AN ARTICULATED MOBILE ROBOT M.S. Thesis [ETUDE D'UN SYSTEME DE PLANIFICATION ET DE SUIVI DE CHEMIN POUR UN ROBOT MOBILE ARTICULE]
Isabelle Girard Jun. 1993 141 p In FRENCH
(ISBN-0-315-86502-4; CTN-94-61203) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Three methods based on the control approach are studied for possible application to path planning and tracking for an articulated mobile robot. The path planning problem is formulated as a control problem, and system entries are sought which will steer the system from an initial to a final configuration. The three methods considered (Murray and Sastry (1990), Tilbury and Sastry (1992), and Fernandez, Li and Gurvits), all use sinusoids as control inputs. The first two are rejected, while the third gives a good motion planner. Its principal limitation is a relatively long computation time. For path tracking, the lateral and orientation offsets of the robot are defined with respect to the point on the path which is closest to the actual position of the robot. To develop the motion controllers that will correct these offsets, the dynamic model of the system is linearized to obtain two decoupled systems that characterize the translational and the rotational motion. The controller of each of these systems comprises a feedforward component and a feedback component. The behavior of the control system is analyzed using simulations. These show the robustness of the control strategy under the influence of different initial conditions and constant perturbations. Author (CISTI)

DEVELOPMENT OF A FEEDFORWARD CONTROLLER FOR A FLEXIBLE MANIPULATOR M.S. Thesis [MISE AU POINT D'UN CONTROLEUR ANTICIPATIF POUR UN MANIPULATEUR FLEXIBLE]
Koorush Ziarati Jan. 1993 139 p In FRENCH
(ISBN-0-315-86515-6; CTN-94-61205) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A test bench comprising a motor, elastic joint, and rigid or flexible arm was built and used to test a feedforward controller based on the knowledge of the dynamic model of the rigid system to which a quasi-static correction has been added. This control was computed off-line and applied in real time to the system. To reduce the disturbance effects and ensure system stability at the end of the trajectory, a feedback signal computed through measurement of motor angle was applied first. A second feedback signal computed from evaluating the flexible arm curvature was added to the above scheme. The deformation of the flexible link was measured with strain gauges. A model of the system was formulated by taking into account both the joint elasticity and the arm flexibility effects. The model parameters were measured experimentally and validated by comparing simulation and test results. A software package was developed for simulation and real-time implementation. The control strategy was also tested by experiment and simulation. The multistage controller allows control of flexible robots. Tracking error is low for slow and averaged velocity tracking trajectories. The simplicity of calculation indicates a potential for control implementation in real time for flexible robots with several degrees of freedom. Author (CISTI)

The first workshop on Artificial Intelligence (AI) Applications in Solar-Terrestrial Physics was held at the University in Lund, Sweden. The Workshop's three-day schedule included sessions on theory, applications, and data bases, demonstrations, and ample time for discussion. The sessions consisted of invited reviews, short contributions, computer presentations, and posters. The value of data access via Internet was shown when Yohkoh images, Stanford magnetograms, and NOAA's solar and geophysical images were displayed and discussed on the final day of the Workshop. NTIS

LIGHT-TRAFFIC ANALYSIS FOR QUEUES WITH SPATIALLY DISTRIBUTED ARRIVALS
Dirk P. Kroese and Volker Schmidt 26 Jul. 1993 29 p
(ISSN 0169-2690)
(MEMO-1150; ETN-94-95724) Avail: CASI HC A03/MF A01

The following continuous polling system is considered: customers arrive according to a homogeneous Poisson process (or a more general stationary point process) and wait on a circle in order to be served by a single server. The server is 'greedy', in the sense that he always moves (with constant speed) towards the nearest customer. The customers are served according to an arbitrary service time distribution, in the order in which they are encountered by the server. First order and second order Taylor expansions are found for the expected configuration of customers, for the mean queue length, and for expectation and distribution function of the workload. It is shown that under light traffic conditions the greedy server works more efficiently than the cyclically polling server. ESA

A REAL-TIME COMPUTER CONTROL AND TRAJECTORY GENERATION ENVIRONMENT FOR TRUSSARM M.S. Thesis
Joseph P. Sallmen 1993 228 p
(ISBN-0-315-87060-5; CTN-94-61247) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A variable geometry truss shows promise as a next-generation design for a manipulator for space applications. A proof of concept one-bay version of octohedral geometry (Trussarm Mark I) has been constructed. It is outfitted with an industrial motion controller capable of independent closed-loop proportional integral derivative control on each actuator. The objective is to provide a user/machine interface for the control and evaluation of Trussarm. The overall system (hardware and software) is examined, focusing on the computer programming and operator interface. The theoretical preliminaries of the electro mechanical control, the kinematics of Trussarm, and trajectory design are described, followed by an in-depth discussion of the Trussarm Trajectory Generator and Trussarm Control Environment, two computer programs which allow testing and demonstration of the Trussarm facility. The software requirements are listed, followed by a detailed design and implementation. Plots of trajectory data from Trussarm are presented. References are made throughout to how the current system may accommodate a four-bay Trussarm, the next design. Author (CISTI)

SAFE NAVIGATION AND ACTIVE VISION FOR AUTONOMOUS VEHICLES: A PURPOSIVE AND DIRECT SOLUTION Ph.D. Thesis
Gin-Shu Young 1993 191 p
Avail: Univ. Microfilms Order No. DA9327522

Two capabilities strongly desired in the operation of autonomous vehicles are safe navigation and active vision. It is a challenge to develop autonomous vehicles capable of operating in complicated, unpredictable, and hazardous environments. To navigate autonomous vehicles safely, obstacles such as protrusions, depressions, and steep terrains must be discriminated from terrain before any path planning and obstacle avoidance activity is undertaken. In the first part of the dissertation, a purposive and direct approach to obstacle detection for safe navigation has been developed. The method finds obstacles in a two dimensional image-based space, as opposed to three dimensional reconstructed space, using optical flow. The theory derives from new visual linear invariants based on optical flow. Employing the linear invariance property, obstacles can be directly detected by using a reference flow line obtained from measured optical flow. The main features of this approach are that two dimensional visual information (i.e., optical flow) is directly used to detect obstacles and no range, three dimensional motion, or three dimensional scene geometry is recovered; the method of finding protrusions and depressions is valid for the vehicle (or camera) undergoing general six degree of freedom motion; and the error sources involved are reduced to a minimum, since the only information required is one component of optical flow. A number of experiments from both synthetic and real image data suggest that the approach is effective and robust. The method is demonstrated on both ground and air vehicles. To enhance the capability of active vision, the computer controlled camera system must be calibrated. In the second part of this dissertation, a purposive and direct method for the calibration of the camera system is developed. The method calibrates all the joint poses and link frames of the manipulator and the camera poses related to the same world frame. The solution for the manipulator, camera-to-manipulator, and base-to-world calibration is developed in closed form. The main features of this technique are that only the form of one equation solving one parameter is used and the camera-to-manipulator and base-to-world calibration are the by-products of the manipulator calibration procedure. ANALYSIS AND DESIGN OF A FORMAL NEURAL NETWORK FOR FILTERING A DYNAMIC SIGNAL M.S. Thesis [ANALYSE ET CONCEPTION D'UN RESEAU DE NEURONES FORMELS POUR LE FILTRAGE D'UN SIGNAL DYNAMIQUE]
M. Abderrahim Ennaji Sep. 1992 220 p In FRENCH

(ISBN-0-315-86932-1; CTN-94-61220) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/HC

A detailed analysis is made of the capacity of a feedforward neural network for filtering signals. This network is trained to memorize and generalize a dynamic signal. A number of neural network architectures are studied to bring out the specific qualities related to filtering of dynamic signals. A proposed model demonstrates the capacity of a feedforward network to memorize a dynamic signal, to generalize it at the amplitude and frequency level, to reconstruct an already learned signal, to reproduce any signal with added noise in the form of high and low frequency components, and to filter a signal in the manner of a high-pass, low-pass, bandstop, or bandpass filter. The study focuses on the possibility of reducing the size of training data to eventually decrease the convergence time without affecting model performance. The number of nodes in the network is optimized and a relation is established between the signal to be learned and the number of nodes in the input and cache layers. CISTI

PHOTOPYROELECTRIC SPECTROSCOPY AS A NON-INTRUSIVE TECHNIQUE FOR THE DETERMINATION OF THE OPTICAL ABSORPTION SPECTRA OF MULTIPLE QUANTUM WELL SAMPLES M.S. Thesis
Christine Alison daSilva 1993 160 p
(ISBN-0-315-87164-4; CTN-94-61250) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Photopyroelectric (PPE) spectroscopy is a new and nonintrusive technique for the measurement of optical absorption spectra in bulk and thin-film materials. The technique is used for the first time to measure the optical absorption spectra of AlGaAs/GaAs multiple quantum wells (MQW) on a semi-insulating (SI) GaAs substrate. First, the motivation for and the current state of characterizing MQWs is discussed. The features of PPE spectroscopy and some other methods of characterizing are then detailed. An improved model of a three-layer specimen, the pyroelectric detector, and the signal generation system is presented. This model is then adapted to a computer program which offers several options, among which is the calculation of the optical absorption spectra. These calculations are made in conjunction with experimentally obtained PPE spectra of the MQW and substrate materials. Semiquantitative spectra for the optical absorption coefficients of an AlGaAs/GaAs MQW in the 900 to 1080 nm wavelength range were calculated. The computer adaptation of the theoretical model was found to simulate all the correct trends in PPE spectra. An accurate prediction of the PPE spectrum of a SI GaAs sample at 16 kHz modulation frequency was made. Author (CISTI)

REAL-TIME CONTROL AND APPLICATION TO ROBOTICS: HARDWARE AND SOFTWARE ARCHITECTURES M.S. Thesis
Chin Zhou 1993 171 p
(ISBN-0-315-87192-X; CTN-94-61251) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Systems were designed and real-time control architectures implemented for three experimental facilities developed as test beds for verification and experimental studies of new robotic control schemes. These setups use complex real-time control systems and are characterized by modular and open hardware and software architectures that can be easily reconfigured and control levels that can be directly assessed. Computer hardware suitable for real-time control applications is studied systematically to achieve well-designed system architectures and full utilization of hardware resources. Two hardware architectures were designed and implemented, one a VERSA-module Eurocards bus based architecture implemented for a telerobot system, the other a two-level distributed parallel multiprocessor architecture implemented in a multi-arm facility and a coordinated dual-arm system. A versatile real-time software environment for the three setups was designed based on a multiprocessor resource limited hardware configuration. The software consists of the following hierarchical levels: an extended computer module level, a real-time operating system (RTOS), an abstract robot control level, and a user integration level. At the last level, the software is independent of hardware and the RTOS and is easily reconfigurable. Author (CISTI)

HIGH-SPEED PATH CONSTRAINED MANIPULATOR OPERATION USING OPTIMAL-FEEDBACK COMBINED CONTROLLER Ph.D. Thesis
Akihiko Kumagai 1993 152 p
Avail: Univ. Microfilms Order No. DA9328005

Feedback control schemes for manipulators for high-speed/high-accuracy trajectory execution are studied. Also separately from this issue, kinematic singularity problems and a model based feedback control method for parallel manipulators are studied. For the first part, a near-minimum time feedback controller is developed using the non-uniform time scaling technique. Using this controller, the speed of a manipulator is automatically adjusted reacting to the experienced parameter errors and external disturbances. The controller moves the manipulator to follow a given path within a near-minimum time using the available actuator torque capacities in the most efficient manner and maintaining the stability of the controller. A scheme to maintain the stability of feedback controllers for saturated input torque conditions is introduced by locally applying the non-uniform time scaling technique. A variable gain control scheme is combined with the non-uniform time scaling technique to develop a near-minimum time class controller to provide satisfactory accurate trajectory control under extremely uncertain dynamic environment. The uniform time scaling technique is used to strengthen the stability effect of feedback controllers. For the second part, a general theory is developed for obtaining global properties, such as unstable configurations, of parallel manipulators using direct kinematic polynomial discriminants and Jacobians. The unstable configurations of the platform of a parallel manipulator occur when two branches of the direct kinematics coalesce into one, and the discriminant of the direct kinematic polynomial vanishes. The Jacobian of the direct kinematics, which relates the passive joint velocities and the active joint velocities, is also singular at the unstable configurations. The workspace and accessibility regions of the platform of parallel manipulators are obtained by analyses of the direct and inverse kinematic polynomials and the topological maps between the joint space and task space. The dynamic equations of parallel manipulators are derived using two different approaches, the Newton-Euler formulation and the Lagrangian formulation with the Lagrange multipliers. Then a model based feedback controller is developed using these dynamic equations. Dissert. Abstr.

ROBOT MOTION VISION BY FIXATION Ph.D. Thesis
M. Ali Taalebinezhaad 1992
Avail: Issuing Activity (MIT Libraries, Rm. 14-0551, Cambridge, MA 02139-4307)

In numerous current and future applications ranging from autonomous navigation of mobile robots to collision avoidance systems for cars, an imaging system (installed on a moving vehicle) takes 2D images of an environment with the aim of finding the motion of the vehicle (translational and rotational velocities) as well as the structure of the environment (shape). In machine vision, this problem is referred to as the general motion vision problem. This thesis introduces a direct method called fixation for solving this general motion vision problem, arbitrary motion relative to an arbitrary environment. Avoiding feature correspondence and optical flow has been the motivation behind this direct method which uses the spatio-temporal brightness gradients of the images directly. The fixation method results in a linear constraint equation (Fixation Constraint Equation) which explicitly expresses the rotational velocity in terms of the translational velocity. The combination of this constraint equation with the Brightness-Change Constraint Equation (a fundamental equation which relates the motion to the brightness gradients at any image point) solves the general motion vision problem. In contrast to previous direct methods, the fixation method does not impose any severe restrictions on the motion or the environment. Moreover, the fixation method neither requires tracked images as its input or uses tracking for obtaining fixated images. Instead, it introduces a novel technique called the pixel shifting process to construct fixated images for any arbitrary fixation point. This is done entirely in software without any need to move the imaging system for tracking. This fixation method has been successfully tested in the real world environment for the recovery of the motion and shape in the general case. The experimental results are presented and the implementation issues and techniques are discussed. Dissert. Abstr.

ADAPTIVE CONTROL OF TELEROBOTIC SYSTEMS WORN BY HUMANS Final Report
J. B. Bagley, Jr. 27 Sep. 1993 94 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A276608; NUWC-NPT-TD-10212) Avail: CASI HC A05

A distinguishing feature of man is his ability to invent mechanical devices to augment his physical capabilities. Traditionally, these machines have been master-slave devices with man controlling the activities of the machine. Recent work has been done to develop a control architecture for the coupled man-machine systems; however, these systems rely on a complete and detailed description of the device and its operating environment. The necessity of an environmental model places limitations on the machine's ability to perform different tasks. This report discusses how environmental dependence can be overcome through the use of a parameter estimator, which operates on data contained in the system. This report first verifies the performance of the control architecture. A linear estimation technique is then used to allow the system to adapt to an unknown time-invariant environment. Also discussed is how the results of the adaptations can be extended to the problem of an unknown time-varying environment. DTIC

APPLICATION OF ARTIFICIAL INTELLIGENCE TO THE DOD CORPORATE INFORMATION MANAGEMENT (CIM) PROGRAM
Howard E. Bylund, Jr. Apr. 1993 33 p
(AD-A276656; NDU-ICAF-93-F40) Avail: CASI HC A03/MF A01

This paper analyzes the DoD Corporate Information Management (CIM) Program and the level of Artificial Intelligence being inserted into the program. This analysis is done by using commercial business activities as a baseline. It addresses the introduction of Artificial Intelligence (AI) through the benchmark process of the DoD CIM. It was found that this benchmark process of the CIM, similar to the DoD Total Quality Management (TQM) process, is determining the level of technology insertion into the CIM. It is recommended that this process continue and that, as with other technologies, AI be incorporated as demonstrated beneficial through the benchmark process. DTIC

MODELING AND CONTROL OF NONLINEAR SYSTEMS Final Report, 1 May 1991 - 31 Aug. 1993
John E. Hauser 10 Jan. 1994 5 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0255-91)
(AD-A277377; AFOSR-94-0052TR) Avail: CASI HC A01

We have conducted research on the modeling and control of nonlinear systems. Our efforts have been directed toward understanding the control of truly nonlinear behavior as well as the synthesis of control laws for systems that can be nearly transformed into linear systems (via approximate feedback linearization). We have introduced a new framework for understanding and analyzing the stability and control of nonlinear maneuvering systems. This approach is based on the concept of transverse dynamics. We have demonstrated the usefulness of this approach in the control of the swinging energy of the pendulum for an experimental cart and pendulum system. On the theoretical side, we have provided a new method for the construction of converse Lyapunov functions for exponentially stable periodic orbits. New techniques for the approximate feedback linearization of nonlinear systems have been developed. In order to construct a feedback linearizing coordinate transformation, a class of optimization problems has been formulated for finding approximate solutions to an appropriate system of partial differential equations. In contrast to previous results, this approach does not require differentiation of the data describing the system and is therefore applicable to systems with, for example, tabular data. DTIC

EXPLORING PHASE SPACE CONCEPTS IN THE FORECASTING OF TIME SERIES WITH ARTIFICIAL NEURAL NETWORKS
R. D. Rogers and V. Vemuri 13 Sep. 1993 8 p Presented at the American Nuclear Society (ANS) Winter Meeting, San Francisco, CA, 14-18 Nov. 1993
(Contract W-7405-eng-48)
(DE94-005810; UCRL-JC-115072; CONF-931160-40) Avail: CASI HC A02/MF A01

The authors study the performance of feedforward artificial neural networks in forecasting future values of several different time series. They explore both short- and long-term prediction of several periodic time series. They find that a significant source of error in long-term prediction of time series is introduced by a phase shift between the network output and the time series. They explore the origin of this phase shift and suggest strategies for minimizing its effect. They find that the phase diagrams of the time series and the neural network forecast contain useful diagnostic information. DOE

GEOMETRIC STRUCTURE OF THE ADAPTIVE CONTROLLER OF THE HUMAN ARM
Reza Shadmehr and Ferdinando Mussa-Ivaldi 21 Jul. 1993 35 p
(Contract N00014-90-J-1946; NSF ASC-92-17041)
(AD-A276797; AI-1437) Avail: CASI HC A03/MF A01

The objects with which the hand interacts with may significantly change the dynamics of the arm. How does the brain adapt control of arm movements to this new dynamics? We show that adaptation is via composition of a model of the task's dynamics. By exploring generalization capabilities of this adaptation we infer some of the properties of the computational elements with which the brain formed this model; the elements have broad receptive fields and encode the learned dynamics as a map structured in an intrinsic coordinate system closely related to the geometry of the skeletomusculature. The low-level nature of these elements suggests that they may represent a set of primitives with which a movement is represented in the CNS. DTIC

NEURAL NETWORK DEFINITIONS OF HIGHLY PREDICTABLE PROTEIN SECONDARY STRUCTURE CLASSES
A. Lapedes, E. Steeg, and R. Farber 1994 9 p Presented at the Neural Information Processing Systems (NIPS) Conference, Denver, CO, 30 Nov. - 2 Dec. 1993
(Contract W-7405-eng-36)
(DE94-006234; LA-UR-94-110; CONF-9311171-2) Avail: CASI HC A02/MF A01

We use two co-evolving neural networks to determine new classes of protein secondary structure which are significantly more predictable from local amino sequence than the conventional secondary structure classification. Accurate prediction of the conventional secondary structure classes - alpha helix, beta strand, and coil - from primary sequence has long been an important problem in computational molecular biology. Neural networks have been a popular method to attempt to predict these conventional secondary structure classes. Accuracy has been disappointingly low. The algorithm presented here uses neural networks to simultaneously examine both sequence and structure data and to evolve new classes of secondary structure that can be predicted from sequence with significantly higher accuracy than the conventional classes. These new classes have both similarities to and differences with the conventional alpha helix, beta strand, and coil. DOE

A POLLING SYSTEM WITH A DORMANT SERVER

S. C. Borst Jun. 1993 39 p Sponsored by Netherlands Organization for Applied Scientific Research TMO Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0924-0659)

(CWI-BS-R9313; ETN-94-96222) Copyright Avail: Issuing Activity (European Space Agency (ESA))

A polling system with a dormant server, that is, a polling system in which the server may be allowed to make a halt at a queue when there are no customers present in the system, is studied. A pseudo conservation law for a general model is derived and used to compare the dormant and the non dormant server case. The question at which queues the server should make a halt to minimize the mean total amount of work in the system is addressed. Subsequently attention is directed in particular to a globally gated polling system in which the server makes a halt at its home base when there are no customers present in the system. For that system, explicit expressions for the LST of the cycle time distribution, for the LST of the waiting time distribution at each of the queues, and for the pgf of the joint queue length distribution at polling epochs, are derived. The waiting time at each of the queues is shown to be smaller (in the increasing convex ordering sense) than in the non dormant server case. ESA

UNDERGRADUATE ROBOTICS PROJECTS IN SUPPORT OF RESEARCH ON NEURAL NETWORKS Final Report, 15 Jan. - 15 Jul. 1993

Christopher Atkeson 15 Jul. 1993 3 p

(Contract F49620-93-1-0104)

(AD-A277331; AFOSR-94-0088TR) Avail: CASI HC A01/MF A01

This grant was successful both in developing sensor systems and in educating undergraduate students. There were several reasons to ask students to develop these systems. First and foremost is the educational value of having a student build a complete system. This challenge is much greater than a typical course laboratory experiment. The student must propose, refine, and choose among different variants of any particular approach. The system must be designed, built, debugged, documented, and, most importantly, evaluated. Any particular version of the system may suggest future revisions or new approaches. In some cases there are commercially available systems the researchers could use, but in many cases they had trouble finding off the shelf systems that are light and inexpensive enough to suit their purposes. NEURAL MODELS OF SPATIAL ORIENTATION IN NOVEL ENVIRONMENTS Annual Report, 1 Sep 1992 - 31 Aug. 1993

Stephen Grossberg Jan. 1994 23 p

(Contract F49620-92-J-0499)

(AD-A277383; AFOSR-94-0116TR) Avail: CASI HC A03/MF A01

Completed work on this grant analyzes problems of three dimensional vision, visual search, spatial mapping, planning, and action, all of which utilize spatial representations to control adaptive behaviors in real time. Highlights include significant contributions towards solving the classical figure-ground problem for biological vision, the motor equivalence problem for flexible arm movement control including tool use, the problem of self-organizing body-centered spatial representations for movement planning and spatial orientation, and the problem of carrying out fast visual search for targets among multiple distractors. New research directions include projects which have been developed to frontally attack core problems concerning how a rapidly moving agent can self-organize spatial representations, use these representations for real-time movement planning, and transform spatial movement plans into appropriate motor commands for movement control and real-time navigation. Specific projects include retinal image processing, formation of egocentric maps of object positions from optic flow, detection of moving objects from optic flow, integration of eqocentric and allocentric representations for autonomous navigation investigation of spatial reference frames, and transformations between frames for real-time flexible speech articulator control. FUZZY LOGIC APPLICATION FOR MODELING MAN-IN-THE-LOOP SPACE SHUTTLE PROXIMITY OPERATIONS M.S. Thesis - MIT

Robert B. Brown May 1994 146 p

(Contract NAS9-18426)

(NASA-CR-188283; NAS 1.26:188283; CSDL-T-1205) Copyright Avail: CASI HC A07/MF A02

A software pilot model for Space Shuttle proximity operations is developed, utilizing fuzzy logic. The model is designed to emulate a human pilot during the terminal phase of a Space Shuttle approach to the Space Station. The model uses the same sensory information available to a human pilot and is based upon existing piloting rules and techniques determined from analysis of human pilot performance. Such a model is needed to generate numerous rendezvous simulations to various Space Station assembly stages for analysis of current NASA procedures and plume impingement loads on the Space Station. The advantages of a fuzzy logic pilot model are demonstrated by comparing its performance with NASA's man-in-the-loop simulations and with a similar model based upon traditional Boolean logic. The fuzzy model is shown to respond well from a number of initial conditions, with results typical of an average human. In addition, the ability to model different individual piloting techniques and new piloting rules is demonstrated. Author (revised)

A MULTITASKING BEHAVIORAL CONTROL SYSTEM FOR THE ROBOTIC ALL TERRAIN LUNAR EXPLORATION ROVER (RATLER)

P. Klarer 1994 7 p Presented at the CIRFFSS 1994:AIAA/National Aerospace and Space Administration Conference on Intelligent Robots in Field, Factory, Service and Space, Houston, TX, 21-24 Mar. 1994

(Contract DE-AC04-94AL-85000)

(DE94-007293; SAND-94-0408C; CONF-940365-3) Avail: CASI HC A02/MF A01

The design of a multitasking behavioral control system for the Robotic All Terrain Lunar Exploration Rover (RATLER) is described. The control system design attempts to ameliorate some of the problems noted by some researchers when implementing subsumption or behavioral control systems, particularly with regard to multiple processor systems and real-time operations. The architecture is designed to allow both synchronous and asynchronous operations between various behavior modules by taking advantage of intertask communications channels and by implementing each behavior module and each interconnection node as a stand-alone task. The potential advantages of this approach over those previously described in the field are discussed. An implementation of the architecture is planned for a prototype Robotic All Terrain Lunar Exploration Rover (RATLER) currently under development and is briefly described. DOE

STATE-SPACE SELF-TUNER FOR ON-LINE ADAPTIVE CONTROL Final Report, 1 Jun. 1989 - 31 May 1994

L. S. Shieh 1994 9 p

(Grant NAG9-380)

(NASA-CR-195836; NAS 1.26:195836) Avail: CASI HC A02/MF A01

Dynamic systems, such as flight vehicles, satellites and space stations, operating in real environments, constantly face parameter and/or structural

variations owing to nonlinear behavior of actuators, failure of sensors, changes in operating conditions, disturbances acting on the system, etc. In the past three decades, adaptive control has been shown to be effective in dealing with dynamic systems in the presence of parameter uncertainties, structural perturbations, random disturbances and environmental variations. Among the existing adaptive control methodologies, the state-space self-tuning control methods, initially proposed by us, are shown to be effective in designing advanced adaptive controllers for multivariable systems. In our approaches, we have embedded the standard Kalman state-estimation algorithm into an online parameter estimation algorithm. Thus, the advanced state-feedback controllers can be easily established for digital adaptive control of continuous-time stochastic multivariable systems. A state-space self-tuner for a general multivariable stochastic system has been developed and successfully applied to the space station for on-line adaptive control. Also, a technique for multistage design of an optimal momentum management controller for the space station has been developed and reported in. Moreover, we have successfully developed various digital redesign techniques which can convert a continuous-time controller to an equivalent digital controller. As a result, the expensive and unreliable continuous-time controller can be implemented using low-cost and high performance microprocessors. Recently, we have developed a new hybrid state-space self tuner using a new dual-rate sampling scheme for on-line adaptive control of continuous-time uncertain systems. Derived from text

Despite significant advancement in the area of robust parametric control, the problem of synthesizing such a controller is still a wide open problem. Thus, we attempt to give a solution to this important problem. Our approach captures the parametric uncertainty as an H(sub infinity) unstructured uncertainty so that H(sub infinity) synthesis techniques are applicable. Although the techniques cannot cope with the exact parametric uncertainty, they give a reasonable guideline to model the unstructured uncertainty that contains the parametric uncertainty. An additional loop shaping technique is also introduced to relax its conservatism. Derived from text

PARALLEL SUPERCOMPUTING: ADVANCED METHODS, ALGORITHMS, AND SOFTWARE FOR LARGE-SCALE LINEAR AND NONLINEAR PROBLEMS

G. F. Carey and D. M. Young 1993 45 p

(Contract DE-FG05-87ER-25048)

(DE94-008446; DOE/ER-25048/T8) Avail: CASI HC A03/MF A01

The program outlined here is directed to research on methods, algorithms, and software for distributed parallel supercomputers. Of particular interest are finite element methods and finite difference methods together with sparse iterative solution schemes for scientific and engineering computations of very large-scale systems. Both linear and nonlinear problems will be investigated. In the nonlinear case, applications with bifurcation to multiple solutions will be considered using continuation strategies. The parallelizable numerical methods of particular interest are a family of partitioning schemes embracing domain decomposition, element-by-element strategies, and multi-level techniques. The methods will be further developed incorporating parallel iterative solution algorithms with associated preconditioners in parallel computer software. The schemes will be implemented on distributed memory parallel architectures such as the CRAY MPP, Intel Paragon, the NCUBE3, and the Connection Machine. We will also consider other new architectures such as the Kendall-Square (KSQ) and proposed machines such as the TERA. The applications will focus on large-scale three-dimensional nonlinear flow and reservoir problems with strong convective transport contributions. These are legitimate grand challenge class computational fluid dynamics (CFD) problems of significant practical interest to DOE. The methods developed and algorithms will, however, be of wider interest. DOE

ANALYSIS AND SYNTHESIS OF ADAPTIVE NEURAL ELEMENTS AND ASSEMBLES Final Technical Report, 1 Oct. 1990 - 30 Sep. 1993

John H. Byrne 30 Sep. 1993 13 p

(Grant AF-AFOSR-0027-91)

(AD-A277423; AFOSR-94-0095TR) Avail: CASI HC A03/MF A01

The overall objectives of this research were to investigate mechanisms underlying neural plasticity, learning, and memory. Between 1 Oct. 1990 and 30 Sep. 1993, progress was made in eight areas: (1) Voltage-clamp experiments analyzed membrane currents in a neuron that is modified during learning. (2) These data were incorporated into a single-cell model of associative learning. (3) The single-cell model was incorporated into a small neural network and simulations examined the functions of interneurons and the consequences of plasticity at multiple sites. (4) Additional simulations with the single-cell model examined potential cellular mechanisms for operant conditioning. (5) As a first step toward identifying additional loci for learning-induced modifications, the synaptic interactions were characterized among neurons that function as a central pattern generator (CPG). (6) Experiments also characterized how transmitters modulated the properties of the neurons and synaptic connections in the CPG and altered the electrical activity in the CPG. (7) These data were used to develop a model of the CPG, and simulations examined the mechanisms underlying the generation of rhythmic neural activity. (8) A realistic model of a bursting neuron was used to examine mechanisms underlying the generation and modulation of endogenous rhythmic neuronal activity. In addition, a computer program that is a general-purpose simulator for neural networks and action potentials was developed and has been made available to others. These results have provided general insights into information processing and storage in the nervous system. DTIC

CORRELATION FILTER SYNTHESIS USING NEURAL NETWORKS Final Technical Report, Jun. 1991 - Apr. 1993

Steven C. Gustafson and David L. Flannery Dec. 1993 173 p

(Contract F19628-91-K-0014)

(AD-A278124; RL-TR-93-239) Avail: CASI HC A08/MF A02

Excellent results were obtained using neural networks to synthesize filters for optical correlators, including filters for both cluttered backgrounds and target rotation angles not used in training. The most significant results employed new stretch and hammer neural networks which constitute an important and enduring advance because they train with guaranteed upper bounds on computational effort and generalize with guaranteed lower bounds on smoothness and stability. These results indicate good prospects for training neural networks to synthesize filters for a wide range of target distortions, and this approach has clear advantages compared to searching stored filters. CRAD SIGNAL AND INFORMATION PROCESSING WORKING GROUP WORKSHOP ON NEURAL NETWORKS, VOLUME 1

B. A. McArthur, ed. Feb. 1993 243 p Workshop held in Dartmouth, Nova Scotia, 6-7 May 1992

(DREA-TC-93-305-Vol-1; DSIS-93-02664-Vol-1; CTN-94-61183) Avail: Issuing Activity (Defence Research Establishment Atlantic, P.O. Box 1012, Dartmouth, NS B2Y 3Z7 Canada)

A workshop was held to provide the Canadian defense research

establishments and military colleges with a forum for the exchange of information related to the theory, design, and application of neural networks. Nine papers described defense related applications of neural networks, including radar, sonar, speech, pattern recognition, target acquisition and tracking, modulation recognition, and multisensor data fusion. Four papers were devoted to neural network theory and design. Separate abstracts have been prepared for nine papers from this workshop. For individual titles, see N94-33150 through N94-33158.

THE APPLICATION OF A RADIAL BASIS FUNCTION NEURAL NETWORK FOR RADAR TRACKING OVER THE SEA **c32**

Henry Leung and Eloi Bosse *In* Defence Research Establishment Atlantic, CRAD Signal and Information Processing Working Group Workshop on Neural Networks, Volume 1 Feb. 1993 p 3-26 (For primary document see N94-33149 09-63)

Avail: Issuing Activity (Defence Research Establishment Atlantic, P.O. Box 1012, Dartmouth, NS B2Y 3Z7 Canada)

A new technique based on a radial basis function (RBR) neural network has been developed as a solution to the low-angle tracking problem. Computer simulations were carried out to evaluate the performance of the tracking algorithm. It was shown, using simulated data, that the new technique is able to track both stationary and moving targets under low signal to noise ratio environments with high accuracy. It was also demonstrated using real-life multipath data that the new technique is robust in the sense that it is insensitive to array errors and the nature of the background noise. The RBF network could track low flying targets under high sea-state conditions with very high performance in terms of resolution accuracy; in the two experiments conducted, the largest deviation was less than one meter. The algorithm is superior to the MUSIC algorithm in terms of robustness, resolvability, and estimation accuracy. Author (CISTI)

SOME NEURAL COMPUTING APPROACHES TO TARGET TRACKING

Joseph N. Maksym *In its* CRAD Signal and Information Processing Working Group Workshop on Neural Networks, Volume 1 Feb. 1993 p 27-50 (For primary document see N94-33149 09-63)

Avail: Issuing Activity (Defence Research Establishment Atlantic, P.O. Box 1012, Dartmouth, NS B2Y 3Z7 Canada)

Multiple targets, false detections, and maneuvers present difficulties in the application of tracking and data association algorithms. Potential applications of neural networks in target tracking and data association problems are examined. While neural computing has proven useful for many pattern recognition and control applications, it is not yet clear how and where neural networks should be used in systems for tracking targets. Preliminary work on the application of neural networks as adjuncts to more conventional Kalman filter tracking systems is discussed. The possible use of neural networks is applied to model selection in a multiple-model approach to tracking maneuvering targets as well as to measurement to track data association. The focus is on Hopfield and probabilistic networks. A character recognition example illustrates the implementation of a combined Hopfield and probabilistic network approach. Author (CISTI)

NEURAL NETWORKS APPLIED TO THE PHONEMIC SEGMENTATION OF SPEECH **c32**

Roy C. Snell and B. C. Dickson *In* Defence Research Establishment Atlantic, CRAD Signal and Information Processing Working Group Workshop on Neural Networks, Volume 1 Feb. 1993 p 69-81 (For primary document see N94-33149 09-63)

Avail: Issuing Activity (Defence Research Establishment Atlantic, P.O. Box 1012, Dartmouth, NS B2Y 3Z7 Canada)

A technique frequently used to develop software for identifying and classifying patterns is the construction of an expert system. Such a technique can be difficult and time-consuming to apply. Recent advances in neural networks have provided an alternative approach to the pattern classification problem. Using a corpus of already classified data, it is possible to design a neural network and train it to reproduce the classification results indicated on the training data. This approach completely removes the requirement for specifying the rules to be used and also greatly simplifies the final system implementation. The classification results obtained using an expert system are compared to those using a neural network for the problem of identifying nasalized segments of human speech. The waveform analysis used involves tenth order fixed frame linear prediction. Preliminary experiments on a limited data set indicate that the neural network approach will prove to be an effective tool for classifying nasal murmurs in human speech. The use of three output nodes corresponding to nasal, non-nasal, and mixed frames appears to improve the classification efficiency significantly. Since separate networks can be trained to recognize the nasal characteristics of individuals or groups, the process can be easily adapted to any application. Author (CISTI)

AUTOMATIC MODULATION RECOGNITION **c32**

Rene Lamontagne *In* Defence Research Establishment Atlantic, CRAD Signal and Information Processing Working Group Workshop on Neural Networks, Volume 1 Feb. 1993 p 83-103 (For primary document see N94-33149 09-63)

Avail: Issuing Activity (Defence Research Establishment Atlantic, P.O. Box 1012, Dartmouth, NS B2Y 3Z7 Canada)

To automate the problem of surveillance of the radio spectrum in electronic warfare (EW) applications, an intercept and analysis testbed is being built by Defence Research Establishment Ottawa's Communications EW section. As part of the testbed's narrowband digital signal processing subsystem, automatic modulation recognition (AMR) algorithms are being developed to identify the signal modulation type among several known to be in use in a given environment. Time and frequency domain features of the AMR system are reviewed and preliminary test results are presented in which the features are used in combination with an artificial neural network (ANN). It was proposed to increase the robustness of the system by improving the set of features and by using a classifier able to map complex decision regions. The results showed that both ways contributed to improve the system accuracy. Using the classic probabilistic classifier on the new set of features provided impressive results on the order of 94 percent for signal to noise ratios as low as 5 dB. The performance was further improved up to 99.8 percent using an ANN. Author (CISTI)

MULTI-SENSOR DATA FUSION FOR TARGET ACQUISITION

Rony Philippe *In its* CRAD Signal and Information Processing Working Group Workshop on Neural Networks, Volume 1 Feb. 1993 p 129-143 (For primary document see N94-33149 09-63)

Avail: Issuing Activity (Defence Research Establishment Atlantic, P.O. Box 1012, Dartmouth, NS B2Y 3Z7 Canada)

The Canadian Department of National Defense has undertaken the study and development of intelligent systems for acquiring and identifying noncooperative vehicles using a number of sensors such as geophones, microphones, and electromagnetic sensors. By integrating the data from multiple sensors, the goal is to provide as fine a level of discrimination as possible. As a first step, it is necessary to determine the signal features which will serve to discriminate between the vehicles. Once an appropriate set of features has been selected, use of neural nets is proposed for classifying and/or identifying the various signatures and for coming to a decision on the identity of the unknown vehicle. The neural network should prove well suited for the expected variability of the signatures of vehicles due to the noise and uncertainties of a combat environment. In parallel with the search for appropriate signal features, work is beginning in the simulation of neural nets used for character recognition and for controlling phased-array antennas which are made to adaptively produce a peak and null in the radiation pattern in specific directions. PERIODIC AND CHAOTIC SIGNAL GENERATION IN A RECURSIVE ARTIFICIAL NEURAL NETWORK **c32**

Simon A. Barton *In* Defence Research Establishment Atlantic, CRAD Signal and Information Processing Working Group Workshop on Neural Networks, Volume 1 Feb. 1993 p 145-170 (For primary document see N94-33149 09-63)

Avail: Issuing Activity (Defence Research Establishment Atlantic, P.O. Box 1012, Dartmouth, NS B2Y 3Z7 Canada)

The behavior of artificial neural networks of recursive nonlinear processing elements can be rapidly moved from stability, through complex periodicity, to chaotic activity and back again, by only slight and subtle changes in a parameter that controls the steepness of the nonlinear node response functions. It is shown that a simple recursive network of only three sigmoidal nodes can exhibit cyclical behavior whose periodicity depends on the magnitude of a node response parameter, s. High values of s produce chaotic signals. From the numerically estimated values of s for which each period doubling occurs, a value of 4.669 is obtained for Feigenbaum's (1980) universal constant delta (4.669201...), thus confirming that this is a chaotic system. Chaotic and complex cyclical patterns can also arise in networks containing many nodes. The practical implications for artificial neural network applications and the possible biological significance of this effect are discussed. Author (CISTI)

MODULAR NEURAL NETWORK ARCHITECTURES
William C. Treurniet *In* Defence Research Establishment Atlantic, CRAD Signal and Information Processing Working Group Workshop on Neural Networks, Volume 1 Feb. 1993 p 171-207 (For primary document see N94-33149 09-63)
Avail: Issuing Activity (Defence Research Establishment Atlantic, P.O. Box 1012, Dartmouth, NS B2Y 3Z7 Canada)

A number of proposed neural network architectures may be applied to the problem of phoneme classification in speech recognition. Experiments were conducted exploring the utility of some of these architectures including Hampshire and Waibel's Meta-Pi network, Nowlan and Hinton's system of experts, and Smieja's Minos architecture. In general, these modular structures did not perform better than single networks trained with the same data. Some explanations for this lack of improvement are suggested. Two new modular architectures were also designed and tested. The first employed 14 time delay neural network (TDNN) modules to map the complete input space to a different representation of reduced dimensionality. The second consisted of 49 TDNNs, each with one output unit, trained to discriminate one phoneme class from all the others. The first was able to identify 52.4 percent of the test cases correctly but the second only achieved 39.1 percent correct generalization. The same data used to train the latter modular systems were used to train single multilayer networks and TDNN's. For 38 and 49 classes the multilayer networks achieved 43 percent and 45.5 percent correct generalization respectively, while the TDNN's corresponding performances were 46.1 percent and 45.7 percent correct. The results suggest that modular architectures do not produce improved generalization performance compared to single networks. Author (CISTI)

NEAREST-NEIGHBOUR SEARCH IN CONSTANT TIME: AN ALTERNATIVE TO NEURAL NETWORKS FOR PATTERN MATCHING APPLICATIONS
Pierre Zakarauskas and John M. Ozard *In* Defence Research Establishment Atlantic, CRAD Signal and Information Processing Working Group Workshop on Neural Networks, Volume 1 Feb. 1993 p 209-229 (For primary document see N94-33149 09-63)
Avail: Issuing Activity (Defence Research Establishment Atlantic, P.O. Box 1012, Dartmouth, NS B2Y 3Z7 Canada)

Neural networks divide decision space with hyperplanes whose positions are adjusted during training, and the decision regions thus obtained are not necessarily optimal for noisy data. Neural networks also have the disadvantage of a rapid increase in training time for very large problems. To obtain robust pattern matching for problems where the number of patterns becomes very large, an alternate algorithm is proposed. This algorithm finds the training pattern closest to a test pattern, in a time which is asymptotically constant with the total number of patterns. The algorithm first partitions the search space and finds which partition each of the training patterns falls into. When a test pattern is supplied, it is compared to all patterns within the partitions which are within a given distance R to the test pattern. If the distance d between the closest pattern found during the first pass and the test pattern is less than R, the search stops; if not, a second pass is done using d as a search parameter to select partitions. This algorithm guarantees that the nearest neighbor is found. The mean number of operations done to find the nearest neighbor is presented as a function of the density of patterns per partition and the dimensionality of the search space. A global minimum mean number of operations is shown to exist at slightly less than one pattern per partition. Author (CISTI)

NUMERICAL OPTIMIZATION TECHNIQUES IN NEURAL NETWORK TRAINING
Roy C. Snell *In* Defence Research Establishment Atlantic, CRAD Signal and Information Processing Working Group Workshop on Neural Networks, Volume 1 Feb. 1993 p 231-242 (For primary document see N94-33149 09-63)
Avail: Issuing Activity (Defence Research Establishment Atlantic, P.O. Box 1012, Dartmouth, NS B2Y 3Z7 Canada)

Numerical optimization methods are presented as an alternative to the standard backpropagation (BP) algorithm used in the training of multilayer perceptrons. This type of neural network is frequently the one chosen as a method of solving problems in the areas of pattern classification and nonlinear prediction. Aside from network topology considerations, the most significant problem encountered in the use of neural nets is the training process. The formulas used in the standard BP training technique for multilayer perceptrons are first derived. The training algorithm is then examined in the context of the unconstrained minimization of a multivariate function. A review of the standard methods used in numerical optimization points out the inefficiencies of BP, such as the fixed step size which produces divergence and oscillations in the worst cases and slower convergence in others. Alternative methods to improve training are suggested, focusing on the Fletcher Reeves Polak Ribiere minimization algorithm. A number of numerical examples are used to illustrate the increased efficiency of the proposed methods. Author (CISTI)

Event rates encountered by satellite-borne sensors typically exceed the available telemetry bandwidth, necessitating on-board data analysis. One method of reducing output telemetry requirements, employed by data processing units (DPU's) on several recent and forthcoming satellites (VIKING, CRRES, CAMMICE), is to partition the underlying event parameter spaces into disjoint classes and to downlink statistics based on these classes rather than individual events. The DPU's utilize a hardware implemented binary search algorithm to classify each valid event into one of several mass and mass per charge-state (M/Q) groups, using look-up tables written under software control. Mass and M/Q group boundaries are defined via polynomial curves in the underlying parameter spaces. The boundary curves were obtained using a combination of global and local least-squares approximation algorithms applied to preflight sensor calibration data. DTIC

Significant progress was made in a number of aspects of nonlinear and stochastic systems. Important contributions in the adaptive control of finite state Markov chains under partial observations were solved, and significant progress was made along more general directions. A project in surveying the literature on the ergodic control problem for discrete-time controlled Markov processes was completed. This work presented a comprehensive account of the considerable research on this problem over the past three decades. Further extending this effort, we embarked on writing a research monograph entitled 'Ergodic Control of Markov Chains and Stochastic Games' intended for publication as a volume in the series of 'Applications of Mathematics' by Springer-Verglag. A controlled switching diffusion model was developed to study the hierarchical control of flexible manufacturing systems. This study led to significant results in optimal control of stochastic hybrid system in both the discounted and average cost cases. In the area of deterministic nonlinear systems, numerical aspects of approximation linearization were investigated. DTIC

A new architecture for high performance parallel attached processors is described. Based on this architecture, an attached processor can be implemented as multiple memory-to-memory pipelines, each being constructed with a class of fundamental components. The unique features are that the attached processor can be configured to match a set of algorithms and its memory controllers can be programmed to fit the access patterns required by the algorithms. As a result, high utilization of the processing logic for given sets of algorithms can be obtained. An example based on matrix multiplication is used for illustration. Finally, design issues related to the implementation of the attached processor based on an MCM technology are discussed. DTIC

Several definitions for mathematical morphology operations working on fuzzy sets are proposed in the literature. Most of them are based on the same construction principle: translating set relationships into functional ones. A study which shows that triangular norms and conorms, which can be interpreted as fuzzy intersection and union, constitute a general tool for generating a large class of fuzzy morphologies and unify the previous approaches, is presented. The derived morphological operations preserve almost all properties satisfied by classical mathematical morphology. They inherit directly notions related to data fusion and decision theory derived from the interpretation of T-norms and T-conorms in terms of combination of uncertain, imprecise, partial information. SYMPLECTIC RUNGE-KUTTA SCHEMES 3: CANONICAL ELEMENTARY DIFFERENTIALS

M. Sofroniou and W. Oevel Nov. 1993 11 p

(Maths-Rept-A-204; ETN-94-95864) Avail: CASI HC A03/MF A01

Results demonstrating that the symplecticity condition for Runge-Kutta schemes may be eliminated by suitable parameterization of the order conditions are used to reexamine the relationship between order conditions for canonical Runge-Kutta methods and canonical elementary differentials. It is shown that the canonical elementary differential can be specified in terms of one rooted candidate per tree. ESA

SYMBOLIC DERIVATION OF RUNGE-KUTTA METHODS

M. Sofroniou Nov. 1993 24 p

(Maths-Rept-A-205; ETN-94-95865) Avail: CASI HC A03/MF A01

A symbolic computer package, Butcher.m, which may be used to explore and derive Runge-Kutta methods is presented. The package makes use of the graph theoretical formalism attributed to John Butcher. Runge-Kutta methods and the representation used for the free parameters are introduced. The concept of rooted trees and their correspondence with the elementary differentials appearing in a Taylor series expansion of the solution is also introduced. The derivation and implementation of the order conditions is symbolically demonstrated. Solving the resulting nonlinear equations is a very difficult proposition. The Groebner bases algorithm, implemented as part of Mathematica's 'solve' command, which may be used to obtain solutions, is outlined. Butcher's simplifying assumptions and their implementation are explained. These play a crucial role in the derivation of high order schemes. The use of the package is illustrated with several examples. ESA

OBSERVATIONS OF THE NOTION OF MINIMALITY IN THE GENERALIZED STATE SPACE

A. C. Pugh, N. P. Karampetakis, A. I. Vardulakis, and G. E. Hayton Jan. 1994 24 p Sponsored in part by Greek National Foundation

(Maths-Rept-A-207; ETN-94-95867) Avail: CASI HC A03/MF A01

The notion of minimality in the conventional state space is explored in the generalized state space context. In the regular case two disctinct notions are seen to accrue to the term, one which has a true dynamic meaning and one which does not. Some implications for generalized state space systems possessing either of these properties are revealed by a number of results and examples. ESA

(TELECOM-93-E-009; ETN-94-95899) Avail: Issuing Activity (European Space Agency (ESA))

As a technique for obtaining good codes without loss of spectral efficiency, coded modulation relies on a joint design of coding and modulation. For the same purpose but using different means, a system which combines a Maximum Distance Separable (MDS) code, particularly a q-ary (n, k) Reed-Solomon one, and a q-ary Phase Shift Keying (PSK) modulation, is studied. This scheme is clearly different from that of Ungerboeck since it does not involve constellation partitioning, but it results in a Euclidean distance distribution close to that of random coding, which was used by Shannon for proving the channel capacity theorem, provided that q, n and k are large enough. Thus it is possible to obtain by deterministic means the same performance as by random coding, and the criterion for searching good codes, instead of the minimum distance one, may be a measure of similarity of the normalized distance distribution with respect to random coding. Good performance can be achieved only if decoding the MDS code actually works in the Euclidean space. In other words, soft decoding is mandatory. The Battail-Fang algorithm with some modification is used. In a system using PSK, quantification is often performed only on the phase of the received signal. An attempt to perform it on both the phase and the amplitude was made. A performance improvement results since better use is made of the information provided by the channel. The results of both theoretical analysis and computer simulation reported supply evidence of favor of designing codes by means closer to those of the origin, that is, information theory. ESA

A WORST-CASE ANALYSIS OF TWO APPROXIMATE ALGORITHMS FOR THE SYMMETRIC TRAVELLING SALESMAN PROBLEM

Giovanni Righini and Marco Trubian May 1993 10 p Sponsored in part by Ministry of University and Scientific and Technological Research

(Rept-93-036; ETN-94-95805) Avail: Issuing Activty (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

Two algorithms for the asymmetric traveling salesman problem are presented. The worst case performance of both algorithms is bounded by quantities which are independent of the size of the problem (number of vertices) but depend on the weights associated to the arcs. The second algorithm improves a bound previously found under an identical hypothesis. ESA

The solution of fluid structure interaction problems for internal harmonic excitation of a structure is addressed. Doubly Asymptotic Approximations (DAA's) are approximate relations for solving the exterior acoustic problem. For a geometrically simple problem, the responses given by the DAA approach are analyzed for the interaction and for the acoustic problems. For the acoustic problem, when DAA relations are applied on the spherical edge of the fluid domain, the frequency domains of validity of these methods can be determined for a given excitation harmonic. For the associated unidimensional axisymmetric problems, iterative methods were developed, based on the characteristics of the DAA operators, to calculate the exact

exterior acoustic solutions over the whole frequency range. The iterative process expected to be the most efficient, numerically, is applied for the three dimensional case. In the upper frequency range, the iterative solutions are then extended by a new approximate solution obtained by translation of a DAA relation. A variety of numerical methods, using DAA and iterative methods, are proposed for solving the fluid structure interaction problem. ESA

A SURVEY OF NUMERICAL CUBATURE OVER TRIANGLES
J. N. Lyness and R. Cools 1993 25 p Presented at the Joint Meeting of the Canadian Mathematical Society, the American Mathematical Society, and the Mathematical Association of America on Computation 1943-1993, Vancouver, Ontario, 15-19 Aug. 1993
(Contract W-31-109-eng-38)
(DE94-006810; ANL/MCS/CP-81883; CONF-9308116-1) Avail: CASI HC A03/MF A01

This survey collects together theoretical results in the area of numerical cubature over triangles and is a vehicle for a current bibliography. We treat first the theory relating to regular integrands and then the corresponding theory for singular integrands with emphasis on the 'full corner singularity.' Within these two sections we treat successively approaches based on transforming the triangle into a square, formulas based on polynomial moment fitting, and extrapolation techniques. Within each category we quote key theoretical results without proof, and relate other results and references to these. Nearly all the references we have found may be readily placed in one of these categories. This survey is theoretical in character and does not include recent work in adaptive and automatic integration. DOE

NONLINEARITY AS AN ORIGIN OF NONUNIQUENESS IN SOLUTION OF HARTREE'S EQUATION
M. Ya. Amusia and A. F. Ioffe 1993 4 p Presented at the 1993 International Symposium on Nonlinear Theory and Its Applications, Honolulu, HI, 5-10 Dec. 1993
(Contract W-31-109-eng-38)
(DE94-006538; ANL/PHY/CP-81870; CONF-931252-1) Avail: CASI HC A01/MF A01

There is almost no doubt that the surrounding macroscopical world, its chemistry and biology is described by the Schredinger equation, which includes all particles and their interaction. In a very large scale of distances the interaction is of electromagnetic nature and can be presented as a sum of potential energies of all pairs of particles. The solution of the Schredinger equation gives the wave function of any considered system and via it all observable characteristics can be calculated, in principle. The Schredinger equation is linear so it has unique solutions. However containing coordinates and momenta of all particles of the system, it is almost unsolvable for really macroscopical objects and must be simplified. One of the most important steps in this direction was made by Hartree in the twenties, leading to nonlinear equations which bear his name. The wave function of a multielectron system is approximated in Hartree's method by the product of one-particle wave functions, which are selected in a definite fashion. We consider a system of N identical Fermi-particles moving in the Coulomb attractive field of a nucleus of charge Z and interacting one with another via the pair potential V(r1,r2) where r1 and r2 are the radius vectors of the particles. TEXTURE GENERATION ON IRREGULAR REGIONS
J. F. Richardson Jan. 1994 8 p
(AD-A275999) Avail: CASI HC A02/MF A01

This paper describes a technique for the solution of systems of symmetric parabolic partial differential equations that are associated with the generation of biologic texture generating equations on the highly irregular regions associated with complex image geometries. This technique, when used with an automatic grid generation program, allows for the direct and efficient generation of textures on complex surfaces. Since there is a one to one correspondence between the generated texture in the transformed domain and the original surface, there is no need to map the generated texture pattern back to the surface of interest. This technique can be applied to large systems of reaction-diffusion equations, thus expanding the set of patterns that can be produced using models based upon reaction-diffusion equations. In addition, textures based upon variable diffusion constants can be generated including a wide range of anisotropic textures. DTIC

In the Lambek calculus of order 2, only sequents are allowed in which the depth of nesting of implications is limited to 2. A proof that the decision problem of provability in the calculus can be solved in time polynomial in the length of the sequent is given. A normal form for proofs of second order sequents is defined. It is shown that for every proof there is a normal form proof with the same reading. With this normal form, two algorithms that decide about probability of sequents in polynomial time can be given. A REVIEW OF SENSITIVITY ANALYSIS TECHNIQUES
D. M. Hamby 1993 36 p
(Contract DE-AC09-89SR-18035)
(DE94-007192; WSRC-MS-93-576) Avail: CASI HC A03/MF A01

Mathematical models are utilized to approximate various highly complex engineering, physical, environmental, social, and economic phenomena. Model parameters exerting the most influence on model results are identified through a 'sensitivity analysis.' A comprehensive review is presented of more than a dozen sensitivity analysis methods. The most fundamental of sensitivity techniques utilizes partial differentiation whereas the simplest approach requires varying parameter values one-at-a-time. Correlation analysis is used to determine relationships between independent and dependent variables. Regression analysis provides the most comprehensive sensitivity measure and is commonly utilized to build response surfaces that approximate complex models. DOE

MULTIVARIATE SPLINE APPROXIMATION Final Report, 27 Sep. 1990 - 26 Sep. 1993
Carl R. DeBoor and Amos Ron 22 Dec. 1993 6 p
(Contract DAAL03-90-G-0090)
(AD-A276034; ARO-27690.22-MA) Avail: CASI HC A02/MF A01

We started out with the goal of understanding approximation order in a multivariate context, including the approximation of surfaces. In addition, we wanted to understand better the use and analysis of our approach to multivariate polynomial interpolation. We ended up concentrating on approximation from shift-invariant spaces of functions on R(exp d) real space. Here, S is shift-invariant if f is an element of S implies that also f(. - alpha) is an element of S for any integer vector alpha. The simple, yet widely applicable, model we considered concerns the behavior, as H approaches 0, of the distance between f and S of a suitably smooth f from the scaled space S(sub h)(sup h) := (f(./h) : f is an element of S(sub h)), with each S(sub h) a shift-invariant space. Examples of such spaces are provided by finite elements on a regular grid, in particular box spline spaces, also the spaces which make up the multiresolution analysis generated by wavelets. DTIC

ON THE EQUIVALENCE OF LAMBEK CATEGORIAL GRAMMARS AND BASIC CATEGORIAL GRAMMARS
Wojcieh Buszkowski (Adam Mickiewicz Univ., Poznan, Poland.) Jul. 1993 22 p Sponsored by EEC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0928-3307)
(LP-93-07; ETN-94-95999) Avail: CASI HC A03

It is known that Lambek categorial grammars (LCG's) are weakly equivalent to context free grammars (CFG's), hence also to BCGs (basic CG's), by Gaifman's theorem. It is shown that for any product free LCG G, there is an equivalent BCG G' which results from expanding the initial type assignment of G by means of some Lambek derivable formulae, as expected by many authors and erroneously proven by some. The construction uses a modification of Pentus' argument and the interpretation of Gaifman's theorem on the basis of the Lambek calculus. The latter is presented more carefully and, as a result, a proof of Gaifman's theorem is obtained in which the Lambek calculus is essentially involved. ESA

COMPLETENESS AND DECIDABILITY OF THE MIXED STYLE OF INFERENCE WITH COMPOSITION
Makoto Kanazawa (Stanford Univ., CA.) Oct. 1993 19 p Limited Reproducibility: More than 20% of this document may be affected by

microfiche quality
(ISSN 0928-3307)
(LP-93-09; ETN-94-96001) Avail: CASI HC A03

A complete calculus for mixed inference with composition is presented and it is proved that it has the finite model property and is therefore decidable. A variant of the calculus complete with respect to functional models is presented and completeness and decidability of other styles of inference involving composition, including dynamic inference, are mentioned. A trend in one corner of logic is to regard the meaning of a sentence as a relation on information states. This 'dynamic' perspective gives rise to a number of new conceptions of inference, allowing different answers to the question of what it means for conclusion C to follow from premises P(sub 1), ..., P(sub n). One such dynamic notion of inference is what van Benthem calls mixed inference, which is of particular interest for its connection to Veltman's update semantics. Mixed inference is investigated with respect to such standard logical questions as axiomatizability and decidability. Other dynamic styles of inference are discussed. ESA

This project produced a National Research Council report from the Board on Mathematical Sciences, Mathematical Research in Materials Science. Opportunities and Perspectives, that documents and presents technical details of fruitful collaborations between the mathematical sciences and materials science, and indicates areas of mathematical sciences research holding the most promise for advancing materials science. Written primarily for mathematical and materials science researchers with an interest in advancing research at this interface, as well as for federal and state agency representatives interested in encouraging such collaborations, it focuses on directions for potentially promising collaboration between materials scientists and mathematical scientists, and encourages both communities to increase such collaborations. It emphasizes that both the mathematical sciences and materials science communities have much to win from an increase in cross-disciplinary collaborations, and presents recommendations for facilitating mathematical sciences research that bears on important issues in materials science, including recommendations on how to attract students and young researchers to this area. It seeks to encourage research directions in the mathematical sciences that complement vital materials science research, and raise awareness of the value of quantitative methods in materials science. FULLY DISCRETE ARBITRARY-ORDER SCHEMES FOR A MODEL HYPERBOLIC CONSERVATION LAW

J. Shi and E. F. Toro Jun. 1993 24 p
(Cranfield-Aero-9307; ISBN-1-871564-63-8; ETN-94-96070) Avail: CASI HC A03/MF A01; Cranfield Univ. of Technology, Coll. of Aeronautics, Cranfield, Bedford MK43 0AL, England, HC

An approach for constructing two level explicit fully discrete arbitrary order conservative numerical methods for one dimensional scalar hyperbolic equation is presented. To illustrate the technique fully discrete second, third, and fourth order conservative numerical schemes are given. Numerical experiments indicate that the second order methods are not accurate for problems requiring long time evolution, and a dramatic improvement of the numerical solution is seen when the accuracy changes from second to fourth order. The foundations for developing high order methods that are applicable to nonlinear systems of hyperbolic conservation laws are presented. There are two major problems to be addressed. One is the problem of monotonicity of the schemes near high gradients (for example shocks) and the other is the extension of the approach to nonlinear systems. These issues are the subjects of current research. ESA

TWO MODELS SOLVING THE INCREASING ENERGY PROBLEM OF THE CONTINUOUS HOPFIELD NETWORK MODEL

M. A. Odijk 1993 20 p
(ISSN 0922-5641)
(Rept-93-87; ETN-94-96132) Copyright Avail: CASI HC A03/MF A01

The integral term of the energy function of a continuous Hopfield network is often neglected in order to use the model for optimization purposes. Unfortunately, this diminishes the computational power of the model. What is more, omitting the integral term may cause the energy to increase, thus, disturbing the computations. One solution to overcome these problems is to omit the decay term in the motion equation. Then, the integral term can be deleted in a natural manner. Another solution is to increase the gain exponentially during the state evolution. It can be shown that when applying one of those solutions the Hopfield energy function without the integral term is a Liapunov function for the motion equation. The idea of omitting the decay term or increasing the gain is not new. However, it is claimed that the theoretical support is presented. In particular, it can be shown that both solutions yield models that have equal computational power. There also exists an interesting physical relation between the two solutions. ESA

The number of limit cycles appearing in two dimensional predator-prey systems is investigated. Uniqueness of limit cycles is proved for systems with a functional response more general than the standard Holling types 2 and 3. The transformation to Lienard systems is discussed. Examples of systems with at least two limit cycles are given. The aim is to indicate in which cases no, one, or at least two limit cycles appear. ESA

The context of this note is the discretization error made by the m-panel trapezoidal rule when the integrand has an algebraic singularity at one end, say x = 0, of the finite integration interval. In the absence of a singularity, this error in described by the classical Euler-Maclaurin summation formula, which is an asymptotic expansion in inverse integer powers of m. When an integrable singularity (x(sup alpha) with alpha greater than -1) is present, Navot's generalization is valid. This introduces negative fractional powers of m into the expansion. Ninham has generalized this result to noninteger alpha satisfying alpha less than -1. In this note, we extend these results to all alpha by providing the nontrivial extension to negative integer alpha. This expansion differs from the previous expansions by the introduction of a term log m. DOE

TRACTABLE DEDUCTION IN SOME FRAGMENTS OF AUTO-EPISTEMIC LOGIC

G. J. Akkerman 1993 18 p Sponsored by Netherlands Organization for Scientific Research
(ISSN 0922-5641)
(Rept-93-89; ETN-94-96134) Copyright Avail: CASI HC A03/MF A01

The three fragments of default logic that have been shown to have tractable decision problems by Kautz and Selman, are considered and it is shown that the corresponding decision problems for auto-epistemic logic have similar complexities. This serves to demonstrate that stratified theories (for which, due to its allowing only one extension, all decision problems collapse in to one) form not the only reasonable tractable fragment of auto-epistemic logic. HETEROCLINIC ATTRACTORS: TIME AVERAGES AND MODULI OF TOPOLOGICAL CONJUGACY

Floris Takens 1993 15 p
(W-9318; ETN-94-96179) Avail: CASI HC A03/MF A01

Heteroclinic 'attractors,' which differ from usual attractors in the sense that they are only attracting from one side, are considered, as in an example by Bowen of a smooth (at least C cubed) vector field in the plane with two saddle points and two saddle connections. The eigenvalues of the linearized vector fields at the saddle points are supposed to be so that the cycle, consisting of the two saddle connections, is attracting from the inside. The special property of the example is that for no orbit, converging to this cycle, there is a corresponding 'physical measure.' ESA

PAIRWISE-COMPARISON USING THE LOGARITHMIC LEAST SQUARES METHOD AND THE GENERALIZED PSEUDOINVERSE

M. Kwiesielewicz 1993 17 p Sponsored by Tech. Univ.
(ISSN 0922-5641)
(Rept-93-84; ETN-94-96129) Copyright Avail: CASI HC A03/MF A01

The logarithmic least square method is one of the methods used to rank a finite number of stimuli based on their pairwise comparison. In the case of one decision maker the problem can be solved using the geometric mean method. It is then assumed that the solution is geometrically normalized. In the case of multiple decision makers a set of linear equations is obtained and if there is a different number of judgements for each pair of the compared objects the geometric normalization assumption can not be used directly. It is shown that by applying the generalized pseudoinverse, the solution that is geometrically normalized and consistent with the case of one decision maker is obtained. To define the pseudoinverse the spectral decomposition is used. The structure of the general solution is presented and the existence of the general solution is discussed. ESA

SIMPLE PATCH: A NEW HEURISTIC FOR THE PRODUCT TRAVELING SALESMAN PROBLEM

Gregor A. vanAcken, Jan Bertus Molenkamp, and Rene vanDal 1993 16 p Sponsored by Japan International Science and Technology Exchange Center

(ISSN 0922-5641)

(Rept-93-85; ETN-94-96130) Copyright Avail: CASI HC A03/MF A01

A heuristic Simple Patch is described and compared to other heuristics for the product Traveling Salesman Problem (TSP). Besides the heuristics for the Euclidean TSP and the heuristic uniflow, these heuristics include an algorithm of Gilmore and Gomory. This algorithm gives an optimal solution to the TSP for a special class of matrices; in case of a product matrix it only generates an upper bound. Terminology and basic concepts used are introduced and solvable cases of the product TSP are considered. An interesting research subject is to find classes of matrices for which a given heuristic always generates an optimal solution. A proof of the fact that the improvement algorithm 2-Opt (starting with an arbitrary tour) yields an optimal solution for the symmetric product TSP in polynomial time is given. Heuristics for the product TSP based on the idea of subtour patching are described. Worst case analyses of the three subtour patching heuristics and a complexity analysis of the heuristic Simple Patch are given. The results of a computational experiment are presented. ESA

Research was conducted with the object of supplying certain indications which would allow researchers to utilize multiple regression more effectively when it is applied to variables affected by measurement error. Using a Monte Carlo method, a comparison was made of the relative efficiency of two regression models for estimating the structural relationships of the kind that are encountered in the educational field. The main hypothesis of the research stipulates that on the whole, Fuller's model, conceived specifically for taking measurement errors into account, would have an advantage over the standard model for the situations investigated. Six specific hypotheses complete this hypothesis, one for each of the independent variables, still presuming an advantage for Fuller's method. Simulations were carried out using 3,000 structural relationships which gave place to 9,000 regression analyses. Fuller's model had the advantage in three of the six criteria studied, while the standard model is more advantageous in the other three. It appears probable that Fuller's model gives better results in the presence of larger samples than those used in this research, i.e. samples sizes of 30 and 100. CISTI

A BRIEF INTRODUCTION TO SYMPLECTIC INTEGRATORS AND RECENT RESULTS

P. J. Channell 1994 17 p Presented at the Symplectic Integrators Workshop, Waterloo, Ontario, 14-20 Oct. 1993

(Contract W-7405-eng-36)

(DE94-006225; LA-UR-94-0063; CONF-9310269-1) Avail: CASI HC A03/MF A01

The author begins with a brief synopsis about Hamiltonian systems and symplectic maps. A symplectic integrator is a symplectic map phi(q,p;t) that systematically approximates the time t flow of a Hamiltonian system. Systematic means: (1) in time step, t, i.e. the error should vanish as some power of the time step, and (2) in order of approximation, i.e. one would like a hierarchy of such (phi) that have errors that vanish as successively higher powers of the time step. Currently, the authors known two general types of symplectic integrators: (1) implicit integrators that are derived from a generating function or from algebraic conditions on Runge-Kutta schemes, and (2) explicit integrators that are derived from integrable Hamiltonians or from algebraic conditions on Runge-Kutta schemes. PRINCIPAL COMPONENT ANALYSIS WITH MISSING DATA AND ITS APPLICATION TO OBJECT MODELING

Heung-Yeung Shum, Katsushi Ikeuchi, and Raj Reddy Dec. 1993 44 p

(Contracts F33615-90-C-1465; DAAH04-94-G-0006; NSF IRI-92-24521)

(AD-A276644; CMU-CS-93-213) Avail: CASI HC A03/MF A01

Observation-based object modeling often requires integration of shape descriptions from different views. In current conventional methods, to sequentially merge multiple views, accurate description of each surface patch has to be precisely known in each view, and transformation between any adjacent views needs to be accurately recovered. When noisy data and mismatches are present, recovered transformation becomes erroneous. In addition, the transformation error accumulates and propagates along the sequence, which results in an inaccurate object model. To overcome these problems, we have developed a weighted least square (WLS) approach which simultaneously recovers object shape and transformation among different views without recovering inter-frame motion as an intermediate step. We show that object modeling from a sequence of range images is a problem of principal component analysis with missing data (PCAMD), which can be generalized as a WLS minimization problem. An efficient algorithm is devised to solve the problem of PCAMD. After we have segmented surface regions in each view and tracked over all the sequence, we construct a 3F x P normal measurement matrix of surface normals, and an F x P distance measurement matrix of normal distances to the origin for all visible P regions appeared over the whole sequence of F views, respectively. These two measurement matrices, which have many missing elements due to noise, occlusion, and mismatching, enable us to formulate multiple view merging as a combination of two WLS problems. A two-step algorithm, which employs the quaternion representation of the rotation matrix, is presented to compute surface descriptions and transformations among different views simultaneously. DTIC

The required inner products in the Galerkin solution of the integral equation, using a basis of exponential-weighted Laguerre polynomials, are expressed as a series of algebraic forms. We are presently evaluating

these series to get a feel for the invertibility of the integral equation (transformed to a system of linear equations), prior to any inclusion of the anticipated asymptotic behavior from the Sommerfeld half-space problem. If this unmodified system of the first kind inverts nicely, then its inverse can be used to express the boundary value problem as a system of the second kind; resulting in a whole new set of opportunities for iterative or perturbation series approaches. MINIMIZATION OF COMPUTATIONAL REQUIREMENTS IN THE HYBRID STRESS FINITE ELEMENT METHOD Final Report

Erik Saether Feb. 1994 42 p

(AD-A277120; ARL-TR-336) Avail: CASI HC A03/MF A01

The hybrid stress method has demonstrated many improvements over conventional displacement-based elements. A main detraction from the method, however, has been the higher computational cost in forming element stiffness coefficients due to matrix inversions and manipulations as required by the technique. By utilizing special transformations of initially assumed stress fields, a spanning set of orthonormalized stress modes can be generated which simplify the matrix equations and allow explicit expressions for element stiffness coefficients to be derived. The developed methodology is demonstrated using several selected 2-D quadrilateral and 3-D hexahedral elements. DTIC

A geometric transform of sets, based upon intersections of the set with lines, is introduced. Many basic integral geometric formulae used in stereology can be expressed as identities concerning this transform. It is also closely related to the glance function used by Waksman to construct a metric for subsets of the plane. That construction is modified to obtain a new metric eta for 'regular' sets S contained in R(sup d). The metric eta is shown to be topologically equivalent to the Hausdorff metric on convex sets. The covariance function is proved to be a continuous functional with respect to this new metric on classes of uniformly bounded regular sets. ESA

There exists an vertical matrix (n 2) + 1 parameter quantum group deformation of GL(sub n). An explicit R matrix for this multiparameter family is given. This gives additional information on the nature of this family and facilitates some calculations. This explicit R matrix satisfies the Yang-Baxter Equation (YBE). All solutions of the YBE under the restriction r(sup ab)(sub cd) 0 unless (a, b) = (c, d) are described. One kind of the most general constituents of these solutions precisely corresponds to the vertical matrix (n 2) + 1 parameter quantum group mentioned above. A description of which solutions extend to an enhanced Yang-Baxter operator is given and link invariants are defined. Preliminary results on these link invariants are presented. ESA

KAPLAN-MEIER ESTIMATORS OF INTERPOINT DISTANCE DISTRIBUTIONS FOR SPATIAL POINT PROCESSES

Adrian J. Baddeley (Leiden Univ., Netherlands.) and Richard D. Gill (Utrecht State Univ., Netherlands.) Jul. 1993 33 p Sponsored by Netherlands Organization for Applied Scientific Research TMO Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0924-0659)

(CWI-BS-R9315; ETN-94-96224) Copyright Avail: Issuing Activity (European Space Agency (ESA))

When a spatial point process is observed through a bounded window, edge effects hamper the estimation of characteristics such as the empty space function F, the nearest neighbor distance distribution G, and the reduced second order moment function K. A proposal and a study of product limit type estimators of F, G, and K based on the analogy with censored survival data, where the distance from a fixed point to the nearest point of the process is right censored by its distance to the boundary of the window, is presented. The resulting estimators have a ratio unbiasedness property that is standard in spatial statistics. The empty space function F of any stationary point process is shown to be absolutely continuous and so is the product limit estimator of F. The estimators are strongly consistent when there are independent replications or when the sampling window becomes large. A central limit theorem for independent replications within a fixed observation window, and asymptotic theory for independent replications of sparse Poisson processes, is outlined. In simulations the new estimators are generally much more efficient than the 'border method' estimator but (for estimators of K) somewhat less efficient than sophisticated edge corrections. ESA

CONTROL OF A RANDOM WALK WITH NOISY DELAYED INFORMATION

Eithan Altman (Institut National de Recherche d'Informatique et d'Automatique, Valbonne, France.) and Ger Koole Aug. 1993 16 p Sponsored by Netherlands Organization for Applied Scientific Research TMO Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0924-0659)

(CWI-BS-R9316; ETN-94-96225) Copyright Avail: Issuing Activity (European Space Agency (ESA))

The control of a random walk on the set of nonnegative integers is considered. The controller has two actions. It makes decisions based on a noisy information on the current state but on full information on previous states and actions. The optimality of a threshold policy, where the threshold depends on the last known action, and the noisy information on the current state, is established. The result is applied to a problem of control of service and a problem of a control of flow in the presence of uncontrolled flows. ESA

ALGEBRAIC FUNCTIONS FOR RECOGNITION

Amnon Shashua Jan. 1994 12 p

(Contracts N00014-91-J-1270; N00014-92-J-1879)

(AD-A276803; AIM-1452; CBCL-MEMO-90) Avail: CASI HC A03/MF A01

In the general case, a trilinear relationship between three perspective views is shown to exist. The trilinearity result is shown to be of much practical use in visual recognition by alignment. This yields a direct method that cuts through the computations of camera transformation, scene structure, and epipolar geometry. The proof of the central result may be of further interest as it demonstrates certain regularities across homographies of the plane and introduces new view invariants. Experiments on simulated and real image data were conducted including a comparative analysis with epipolar intersection and the linear combination methods, with results indicating a greater degree of robustness in practice and a higher level of performance in re-projection tasks. A numerical procedure for the automatic accurate location of certain codimension two homoclinic singularities along curves of codimension one homoclinic bifurcations to hyperbolic equilibria in autonomous systems of ordinary differential equations is presented. The procedure also allows for the continuation of multiple codimension homoclinic orbits in the relevant number of free parameters. All known codimension two bifurcations that involve a unique homoclinic orbit are considered. In each case the known theoretical results are reviewed and a regular test function is derived. In particular, the test functions for global degeneracies involving the orientation of a homoclinic loop are presented. The incorporation of such a procedure into an existing boundary value method for homoclinic continuation is shown and implemented using the continuation code AUTO. Several examples are studied, including Chua's electronic circuit and the FitzHugh Nagumo equations. In each case, the method is shown to reproduce codim 2 bifurcation points previously found using ad hoc methods, and, in some cases, to obtain new results. ESA

A Markov point process that exhibits a range of clustered, random, and ordered patterns according to the value of an interaction parameter, is introduced. In contrast to pairwise interaction processes, this model has interaction terms of all orders. The likelihood is closely related to the empty space function F, paralleling the relation between the Strauss process and Ripley's K-function. It is shown that in complete analogy with pairwise interaction processes, the pseudolikelihood equations for this model are a special case of the Takacs Fiksel method, and the model is the limit of a sequence of auto-logistic lattice processes. A STABILITY ESTIMATE BASED ON NUMERICAL RANGES WITH APPLICATION TO A SPECTRAL DISCRETIZATION OF A CONVECTION-DIFFUSION EQUATION
J. L. M. vanDorsselaer and W. Hundsdorfer Oct. 1993 12 p Submitted for publication Sponsored by Netherlands Organization for Applied Scientific Research TMO Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(TW-93-12; ETN-94-96201) Avail: Issuing Activity (European Space Agency (ESA))

The stability of numerical processes for solving initial value problems is addressed. A stability result which is related to a theorem by Von Neumann, where the requirements to be satisfied are less severe and easier to verify, is presented. As an illustration, a simple convection-diffusion equation is considered. For the spatial discretization, a spectral collocation method based on so called Legendre - Gauss - Lobatto points is used and the temporal discretization is based on a one step method. The fully discrete numerical process is shown stable, provided that the temporal step size is bounded by a constant depending only on the convection-diffusion equation, the number of collocation points, and the one step method under consideration. The numerical solution of stiff initial value problems, for nonlinear ordinary differential equations, by Runge-Kutta methods and linear multistep methods that are implicit is addressed. For stiff problems it is common practice to use Newton iteration, or a variant thereof, for solving the system of algebraic equations occurring in each time step of such step by step methods. The error committed by stopping the Newton type iteration was previously studied mainly theoretically. Theoretical upper bounds for this error are confirmed by numerical experiments. In some of the experiments even smaller errors appear to be present than is to be expected according to the theory. ESA

STABILITY ESTIMATES FOR FAMILIES OF MATRICES OF NONUNIFORMLY BOUNDED ORDER
M. N. Spijker and F. A. J. Straetemans Nov. 1993 23 p Submitted for publication Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(TW-93-14; ETN-94-96203) Avail: Issuing Activity (European Space Agency (ESA))

The problem of establishing upper bounds for the norm of the n-th power of square matrices is addressed. The focus is on upper bounds that are valid for families of matrices of finite, but nonuniformly bounded, order. Such upper bounds are relevant to the stability analysis of numerical methods for solving differential equations. In the famous Kreiss matrix theorem a condition, on the resolvent of matrices, occurs which implies

that the norm of the n-th power does not grow faster than linearly with n. A slightly stronger version of this resolvent condition is studied, which is often satisfied in cases of practical interest. This version is proved to imply a growth at a rate that is essentially lower than in the case of the classical Kreiss resolvent condition. A condition, on the iterated resolvent of matrices, which is related to one of the assumptions occurring in the Hille-Yosida theorem, is considered. This condition is known to imply a growth at a rate O(n(exp 1/2)). It is proved that, when a slightly stronger version of the iterated resolvent condition is in force, there is growth at a rate that is at most O(n(exp p)), with p greater than or equal to 0 and less than 1/2. The followng modified Bessel function of third kind of purely imaginary order is considered for real values of the parameters nu, x, x greater than 0: K(sub i(nu))(x) = integral zero to infinity (e exp (-xcosht))(cos (nu)t dt). This function plays an important role in certain problems of mathematical physics. It is the kernel of the Kontorovich Lebedev transform. The paths of steepest descent (the saddle point contours) of this integral are described, giving non oscillatory integrals. The resulting integral representations are important for obtaining asymptotic expansions and for constructing numerical algorithms. Non oscillating integrals representing I(sub i(nu))(x), the modified Bessel function of first kind of purely imaginary order, are also considered. Similar results for the ordinary Bessel functions are summarized. ESA

APPROXIMATION THEORY AND COMPUTATIONAL METHODS FOR THE IDENTIFICATION AND CONTROL OF DISTRIBUTED PARAMETER SYSTEMS Final Report, 1 Nov. 1990 - 31 Oct. 1993

I. G. Rosen 16 Dec. 1993 14 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Grant AF-AFOSR-0076-91)

(AD-A277335; AFOSR-94-0053TR) Avail: CASI HC A03

A brief overview and summary of the research carried out in the area of approximation theory and computational methods for the identification and control of distributed parameter systems is provided. In particular, this final report details our efforts during the period 1 Nov. 1990 - 31 Oct. 1993 on projects involving the adaptive control and estimation and on-line identification of distributed parameter systems (including a collaborative experimental-effort with Air Force personnel at Phillips Laboratory at Edwards Air Force Base), the identification and control of degenerate distributed parameter systems, multigrid methods for the solution of optimal LQR control problems for infinite dimensional systems, wavelet based approximation in the optimal LQ control of distributed parameter systems, the identification of nonlinear Volterra equations with application to materials with memory, the LQ control of linear and nonlinear distributed parameter systems with infinite spatial domain, and optimal control and estimation of thermoelastic systems with applications to thermo-acoustic refrigeration. POLYNOMIAL INTERPOLATION AND APPROXIMATION OF REAL FUNCTIONS. 2: SYMMETRICAL INTERPOLATION FOR THE TRIANGLE Final Report

Qi Chen and Ivo Babuska Nov. 1993 27 p

(Contract N00014-93-I-0131)

(AD-A277345; BN-1158) Avail: CASI HC A03/MF A01

This is the second paper in a series to discuss the approximation efficacy of polynomial interpolation of functions. In particular, the approximation accuracy depends sensitively on the locations of the interpolation nodes. We address the problem of finding the optimal symmetrical polynomial interpolation schemes for the triangle. The table for the symmetrical mean minimal interpolation sets for the triangle is given in this paper. An adaptive scheme for determining the interpolation order is also presented. DTIC

MULTIPLE INHERITANCE VIA INTERSECTION TYPES

Adriana B. Compagnoni and Benjamin C. Pierce 30 Aug. 1993 27 p Sponsored in part by United Kingdom Science and Engineering Research Council; ESPRIT Basic Research Actions TYPES and CONFER; and Netherlands Organization for Applied Scientific Research TMO Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(TR-93-18; ECS-LFCS-93-275; ETN-94-96212) Avail: CASI HC A03

Combining intersection types with higher order subtyping yields a typed model of object oriented programming with multiple inheritance. Objects, message passing, subtyping, and inheritance appear as programming idioms in a typed lambda calculus, a modeling technique that facilitates experimentation and helps in distinguishing between essential aspects of the object oriented style (encapsulation and subtype polymorphism, which are directly reflected in the low level type system) and useful but inessential programming idioms such as inheritance. The target calculus, a natural generalization of system F(sup omega) with intersection types, is of independent interest. Basic structural properties are established and a proof of type soundness using a simple semantics based on partial equivalence relations is given. ESA

ETA PERCENT-SUPERCONVERGENCE IN THE INTERIOR OF LOCALLY REFINED MESHES OF QUADRILATERALS: SUPERCONVERGENCE OF THE GRADIENT IN FINITE ELEMENT SOLUTIONS OF LAPLACE'S AND POISSON'S EQUATIONS

I. Babuska, T. Strouboulis, S. K. Gangaraj, and C. S. Upadhyay Jan. 1994 178 p Sponsored by ARO and Texas Advanced Research Program Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract N00014-90-J-1030; NSF CCR-88-20279; NSF MSS-90-25110)

(AD-A277242; BN-1161; CMC-93-09) Avail: CASI HC A09

This paper is the third in a series in which we study the superconvergence of finite element solutions by a computer-based approach. We studied classical superconvergence and we introduced the new concept of eta percent superconvergence and showed that it can be employed to determine regions of least error for the derivatives of the finite element solution in the interior of any grid of triangular elements. Here we use the same ideas to study the superconvergence of the derivatives of the finite element solution in the interior of complex grids of quadrilaterals of the type used in practical computations. FINITE ELEMENT SOLUTION TO THE HELMHOLTZ EQUATION WITH HIGH WAVE NUMBER. PART 1: THE h-VERSION OF THE FEM Final Report

Frank Ihlenburg and Ivo Babuska Nov. 1993 45 p

(Contract N00014-93-I-0131)

(AD-A277396; BN-1159-Pt-1) Avail: CASI HC A03/MF A01

The h-version of the finite element method with piecewise linear approximation has been applied to solve a one-dimensional model problem

for the Helmholtz equation. The main practical purpose of the investigation is to lay theoretical ground for safe rules of the thumb how to choose the mesh width of the FE-model depending on the wavenumber. In this context, we present new results for stability and error estimation of the FE-solution. Following the analysis, numerical results are discussed. DTIC

COMBINATORY REDUCTION SYSTEMS: INTRODUCTION AND SURVEY
Jan Willem Klop, Vincent vanOostrom, and Femke vanRaamsdonk Sep. 1993 29 p Sponsored by Commission of the Europen Communities and Netherlands Organization for Applied Scientific Research TNO Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-118X)
(CWI-CS-R9362; ETN-94-96156) Copyright Avail: CASI HC A03

A class of orthogonal CRS's (combinatory reduction systems) is introduced and illustrated with many examples, its expressive power is discussed, and an outline of a short proof of confluence is given. This proof is a direct generalization of Aczel's original proof, which is close to the well known confluence proof for lambda calculus by Tait and Martin-Loef. There is a well known connection between the parallel reduction featuring in the latter proof and the concept of 'developments,' and a classical lemma in the theory of lambda calculus is that of 'finite developments,' a strong normalization result. It turns out that the notion of 'parallel reduction' used in Aczel's proof gives rise to a generalized form of developments, called 'superdevelopments.' The results of a comparison of CRS's with the strongly related format of higher order rewriting, Nipkow's HRS's (higher order rewrite systems), are mentioned. ESA

THE p-q-r-MEDIAL AXIS ALGORITHM REQUIRES ONLY LOCAL OPERATIONS
Peter F. M. Nacken Nov. 1993 10 p Sponsored by Netherlands Organization for Applied Scientific Research TNO Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0924-0659)
(CWI-BS-R9317; ETN-94-96226) Copyright Avail: Issuing Activity (European Space Agency (ESA))

The proof of a conjecture that the detection of the medial axis defined by a p-q-r-metric requires only local operations (restricted to a 16 point neighborhood) on the distance transformed image is presented. This is related to the relative positions the centers of spheres defined by the p-q-r-metric can have, if one sphere is included in the other. The conjecture is proved by considering the extension of chamfer metrics to R squared, and a general algorithm is described. ESA

BOUNDS ON LEAST-SQUARES FOUR-PARAMETER SINE-FIT ERRORS DUE TO HARMONIC DISTORTION AND NOISE
J. P. Deyst (National Inst. of Standards and Technology, Gaithersburg, MD.), T. M. Souders (National Inst. of Standards and Technology, Gaithersburg, MD.), and O. M. Solomon 1994 16 p Presented at the Instrumentation and Measurement Technology Conference, Hammamatsu, Japan, 10-12 May 1994
(Contract DE-AC04-94AL-85000)
(DE94-007859; SAND-94-0254C; CONF-940557-1) Avail: CASI HC A03/MF A01

Least-squares sine-fit algorithms are used extensively in signal processing applications. The parameter estimates produced by such algorithms are subject to both random and systematic errors when the record of input samples consists of a fundamental sine wave corrupted by harmonic distortion or noise. The errors occur because, in general, such sine-fits will incorporate a portion of the harmonic distortion or noise into their estimate of the fundamental. Bounds are developed for these errors for least-squares four-parameter (amplitude, frequency, phase, and offset) sine-fit algorithms. The errors are functions of the number of periods in the record, the number of samples in the record, the harmonic order, and fundamental and harmonic amplitudes and phases. The bounds do not apply to cases in which harmonic components become aliased. DOE

AN APPROXIMATE RIEMANN SOLVER FOR MAGNETOHYDRODYNAMICS (THAT WORKS IN MORE THAN ONE DIMENSION) Final Report
Kenneth G. Powell (Michigan Univ., Ann Arbor.) Apr. 1994 16 p Submitted for publication
(Contract NAS1-19480; RTOP 505-90-52-01)
(NASA-CR-194902; NAS 1.26:194902; ICASE-94-24) Avail: CASI HC A03/MF A01

An approximate Riemann solver is developed for the governing equations of ideal magnetohydrodynamics (MHD). The Riemann solver has an eight-wave structure, where seven of the waves are those used in previous work on upwind schemes for MHD, and the eighth wave is related to the divergence of the magnetic field. The structure of the eighth wave is not immediately obvious from the governing equations as they are usually written, but arises from a modification of the equations that is presented in this paper. The addition of the eighth wave allows multidimensional MHD problems to be solved without the use of staggered grids or a projection scheme, one or the other of which was necessary in previous work on upwind schemes for MHD. A test problem made up of a shock tube with rotated initial conditions is solved to show that the two-dimensional code yields answers consistent with the one-dimensional methods developed previously. A method is presented for the computation of a simplicial approximation covering a specified subset M sub o of a two-dimensional manifold M in Rn defined implicitly as the solution set of a nonlinear system F(x) = 0 of n-2 equations in n unknowns. The given subset M sub o is a subset of M is the intersection of M with some polyhedral domain in Rn and is assumed to be bounded and non-empty. The method represents an extension of a local simplicial approximation process developed earlier by the second author. DTIC

A new approach that uses nonstructured mesh to replace the arbitrarily overlapped structured regions of embedded grids is presented. The present methodology uses the Chimera composite overlapping mesh system so that the physical domain of the flowfield is subdivided into regions which can accommodate easily-generated grid for complex configuration. In addition, a Delaunay triangulation technique generates nonstructured triangular mesh which wraps over the interconnecting region of embedded grids. It is designed that the present approach, termed DRAGON grid, has three important advantages: eliminating some difficulties of the Chimera scheme, such as the orphan points and/or bad quality of interpolation stencils; making grid communication in a fully conservative way; and implementation into three dimensions is straightforward. A computer code based on a time accurate, finite volume, high resolution scheme for solving the compressible Navier-Stokes equations has been further developed to include both the Chimera overset grid and the nonstructured mesh schemes. For steady state problems, the local time stepping accelerates convergence based on a Courant - Friedrichs - Leury (CFL) number near the local stability limit. Numerical tests on representative steady and unsteady supersonic inviscid flows with strong shock waves are demonstrated.

Consider the incompressible Euler equations with vortex sheet initial data. For this initial value problem, there are a number of outstanding conjectures: This initial value problem does not have a unique weak or measure-valued solution, a selection principle is required to pick out a unique solution. The limit of vanishing viscosity (in the Navier Stokes equations) provides the correct selection principle, and different regularizations, such as adding viscosity or smoothing the initial vortex sheet, may converge to different limits as the regularization tends to zero.

A THEORY OF CONDITIONAL INFORMATION WITH APPLICATIONS
P. G. Calabrese Mar. 1994 12 p
(AD-A278164) Avail: CASI HC A03/MF A01

The development of conditional propositions, deduction between conditionals, and boolean-like operations on conditionals, and their associated probabilities are here unified in terms of boolean relations of the form B = 0 defined on an initially relation-free algebra of boolean polynomials that transcend an initial domain of discourse. The conditional proposition (a/b) is assigned the conditional probability P(a/b), which is different from the probability that (a/b) is a tautology. The resulting algebraic techniques and demonstrated in several examples such as by simplifying a circular rule-based expert system and removing its circularity and by deriving logical and probability formulas for keeping communication lines open.

LEAST SQUARES APPROXIMATION BY G1 PIECEWISE PARAMETRIC CUBES M.S. Thesis
Marion R. Holmes Dec. 1993 70 p
(AD-A277978) Avail: CASI HC A04/MF A01

Parametric piecewise cubic polynomials are used throughout the computer graphics industry to represent geometric curved shapes. The exploration of the use of parametric curves and surfaces can be viewed as the birth of Computer Aided Geometric Design (CAGD). In this thesis, least squares approximation is used for fitting a geometrically continuous (G1) piecewise parametric cubic polynomial to a sequence of ordered points in the plane. Cubic Bezier curves are used as a basis. The parameterization, the control points, the number of knots, and their locations are determined as part of the approximation process. A development of the algorithm is given, along with some results for a variety of sets of ordered data.

REPRESENTATION, PREDICTION AND IDENTIFICATION OF CYCLOSTATIONARY PROCESSES: A STATE-SPACE APPROACH
Sergio Bittanti, Paolo Bolzern, Giuseppe deNicolao, and Luigi Piroddi 1993 32 p Sponsored in part by Ministry of University and Scientific and Technological Research, and CNR
(Rept-93-041; ETN-94-95810) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

A view of state-space Gaussian CycloStationary (CS) processes in discrete time is presented. The connections among three alternative descriptions are investigated: jointly periodic autocovariance functions, state-space stochastic models (Markovian representations), and Auto Regressive Moving Average models with periodic coefficients (PARMA). Background regarding deterministic periodic systems is given and the properties of state-space representations are investigated. A classification of the various types of state-space representations is provided. PARMA models are investigated from a state-space point of view. The equivalence between input-output and state-space representations, the linear prediction problem, the canonical factorization of PARMA models, and its role in identification, are addressed. The following remarks are made in conclusion: the assumption of Gaussianity was made so that first and second order moments suffice to completely characterize a CS process; most results straightforwardly extend anyway to the case of non-Gaussian (wide sense) CS processes; a point to be noted is that in the non-Gaussian case the Kalman predictor is no more optimal but is just the optimal predictor within the class of linear prediction rules.

A NOTE ON COCYCLES IN A SEMIDIRECT PRODUCT

Karma Dajani 1993 15 p Sponsored by Netherlands Organization for Scientific Research

(ISSN 0922-5641)

(Rept-93-65; ETN-94-96110) Copyright Avail: CASI HC A03/MF A01

Cocycles of a nonsingular ergodic action taking values in a semidirect product were previously studied. By examining their essential range, it was proved that in the topology of convergence in measure, recurrence is a generic property. A continuation of the study of such cocycles is presented. The essential range is shown to be an extension of certain subgroups in the essential range of each coordinate cocycle; this allows the essential range to be viewed as a generalized semidirect product. When the range of the cocycle is contained in R(sup +) (alpha sign) R, sufficient conditions for the projection in the second coordinate to be trivial are given. ESA

THE LAPLACE FUNCTIONAL AND PALM MEASURE OF A QUASI-COX PROCESS WHICH IS DRIVEN BY A MARKOV CHAIN

John G. M. Schoenmakers 1993 15 p

(ISSN 0922-5641)

(Rept-93-82; ETN-94-96127) Copyright Avail: CASI HC A03/MF A01

A quasi-Cox point process in a polish phase space half open interval (0, infinity), open at the right, times U is studied. Let W be a continuous time Markov chain on a finite space A. Consider a realization (f(t)), t greater than or equal to 0, of the chain W. The instant where f makes his k-th jump from a to b, a and b both are a member of A, will be denoted by tau(sub ab; k; f). On U there will be given a set of sigma finite measures the set of (nu(sub a); a is a member of A). Then given a realization f of the Markov chain, the constructed process is the convolution of a Poisson point process with intensity nu(sub f(t))(du)dt and countable many one point processes on the lines the set (tau(sub ab; k; f)) times U, denoted by P(sub ab; k; f). It is shown that the Laplace functional of this process satisfies a specific functional equation and can be represented as a product integral. The Palm and intensity measures of the quasi-Cox process are also derived. Quasi-Cox processes arise in many applications of point processes. For example, the point process of excursions of a Markov process from a finite set of recurrent states is studied. ESA

ON THE RELATIONSHIP BETWEEN GENERALIZATION ERROR, HYPOTHESIS COMPLEXITY, AND SAMPLE COMPLEXITY FOR RADIAL BASIS FUNCTIONS

Partha Niyogi and Federico Girosi Jan. 1994 26 p

(Contracts N00014-93-1-0385; N00014-92-J-1879)

(AD-A276802; AIM-1467; CBCL-MEMO-88) Avail: CASI HC A03/MF A01

In this paper, we bound the generalization error of a class of Radial Basis Function networks for certain well defined function learning tasks in terms of the number of parameters and number of examples. We show that the total generalization error is partly due to the insufficient representational capacity of the network (because of its finite size) and partly due to insufficient information about the target function (because of finite number of samples). We make several observations about generalization error which are valid irrespective of the approximation scheme. Our result also sheds light on ways to choose an appropriate network architecture for a particular problem. DTIC

UNDISCOUNTED MARKOV DECISION CHAINS WITH PARTIAL INFORMATION; AN ALGORITHM FOR COMPUTING A LOCALLY OPTIMAL PERIODIC POLICY

A. Hordijk and J. A. Loeve 1993 18 p Sponsored by Netherlands Organization for Applied Scientific Research TMO Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(TW-93-10; ETN-94-96200) Avail: Issuing Activity (European Space Agency (ESA))

An algorithm of successive approximation type that computes a locally optimal periodic policy for a Markov decision chain with partial state information is constructed. Convergence properties are shown. Under certain conditions the policy found by the algorithm is shown to be locally optimal (or a saddle point) in the class of all admissible Markov policies. The case where the limiting policy is stationary is studied, and the previously mentioned conditions are automatically fulfilled. The algorithm is applied to a queueing network with server control. A perturbation theory for strongly continuous semigroups of operators and their adjoints is explained in the context of a cell division model involving size structure. The theory is based on renewal equations describing the cumulative effect of divisions, rather than on infinitesimal generators. ESA

The stochastic realization problem of representing a stationary Gaussian process as the observation process of a Gaussian stochastic control system is considered. The problem formulation includes that the last m components of the observation process form the Gaussian white noise input process to the system. Identifiability of this class of systems motivates the problem. The results include a necessary and sufficient condition for the existence of a stochastic realization. A subclass of Gaussian stochastic control systems is defined that is almost a canonical form for this stochastic realization problem. For a structured Gaussian stochastic control system an equivalent condition for identifiability of the parametrization is stated. ESA

ARITHMETIC AVERAGING: A VERSATILE TECHNIQUE FOR SMOOTHING AND TREND REMOVAL
E. L. Clark 1993 18 p Presented at the 40th International Instrumentation Symposium, Baltimore, MD, 1-5 May 1994
(Contract DE-AC04-94AL-85000)
(DE94-005274; SAND-93-3979C; CONF-940581-1) Avail: CASI HC A03/MF A01

Arithmetic averaging is simple, stable, and can be very effective in attenuating the undesirable components in a complex signal, thereby providing smoothing or trend removal. An arithmetic average is easy to calculate. However, the resulting modifications to the data, in both the time and frequency domains, are not well understood by many experimentalists. This paper discusses the following aspects of averaging: (1) types of averages -- simple, cumulative, and moving; and (2) time and frequency domain effects of the averaging process. DOE

Probabilistic assessment of variability in model prediction considers input uncertainty and structural uncertainty. For input uncertainty, understanding of practical origins of probabilistic treatments as well as restrictions and limitations of methodology is much more developed than for structural uncertainty. There is a simple basis for structural uncertainty that parallels that for input uncertainty. Although methodologies for assessing structural uncertainty for models in general are very limited, more options are available for submodels. DOE

CONVERGENCE RESULTS FOR THE EM APPROACH TO MIXTURES OF EXPERTS ARCHITECTURES
Michael I. Jordan and Lei Xu Nov. 1993 35 p
(Contract N00014-90-J-1942; NSF ASC-92-17041)
(AD-A276801; AIM-1458; CBCL-MEMO-87) Avail: CASI HC A03/MF A01

The Expectation-Maximization (EM) algorithm is an iterative approach to maximum likelihood parameter estimation. Jordan and Jacobs recently proposed an EM algorithm for the mixture of experts architecture and the hierarchical mixture of experts architecture. They showed empirically that the EM algorithm for these architectures yields significantly faster convergence than gradient ascent. In the current paper we provide a theoretical analysis of this algorithm. We show that the algorithm can be regarded as a variable metric algorithm with its searching direction having a positive projection on the gradient of the log likelihood. We also analyze the convergence of the algorithm and provide an explicit expression for the convergence rate. In addition, we describe an acceleration technique that yields a significant speedup in simulation experiments. DTIC

This National Research Council report from the Board on Mathematical Sciences documents and presents technical details of fruitful collaborations between the mathematical sciences and materials science, and indicates areas of mathematical sciences research holding the most promise for advancing materials science. Written primarily for mathematical and materials science researchers with an interest in advancing research at this interface, as well as for federal and state agency representatives interested in encouraging such collaborations, it focuses on directions for potentially promising collaboration between materials scientists and mathematical scientists, and encourages both communities to increase such collaborations. It emphasizes that both the mathematical sciences and materials science communities have much to gain from an increase in cross-disciplinary collaborations, and presents recommendations for facilitating mathematical sciences research that bears on important issues in materials science, including recommendations on how to attract students and young researchers to this area. It seeks to encourage research directions in the mathematical sciences that complement vital materials science research, and raise awareness of the value of quantitative methods in materials science. It is available through National Academy Press. DTIC

PROCEEDINGS OF THE SYMPOSIUM/WORKSHOP ON APPLICATIONS OF EXPERT SYSTEMS IN DND
Georges Akhras, ed. and Pierre Roberge, ed. Apr. 1992 241 p Symposium/Workshop held in Kingston, Ontario, 23-24 Apr. 1992
(DSIS-93-00343; CTN-94-61182) Avail: Issuing Activity (Royal Military Coll. of Canada, Vimy Post Office, Kingston, ON K7K 5L0 Canada)

A symposium was organized with the intent of creating a vehicle, within the Canadian Department of National Defence, to promote, stimulate, and demystify the development of expert systems and their applications to engineering. Papers were presented on expert systems for applications such as electronic warfare, mission scheduling, threat evaluation, aircraft and avionics maintenance, digital circuit diagnostics, particle accelerator control, air traffic control, search and rescue tracking, and building inspection. More general topics such as knowledge acquisition and expert system development were also included. Separate abstracts have been prepared for 11 papers from this symposium. For individual titles, see N94-33336 through N94-33346.

A DECISION SUPPORT SYSTEM FOR ELECTRONIC WARFARE ANALYSTS
J. G. L. Dumouche and A. L. Jenkins *In* Royal Military Coll. of Canada, Proceedings of the Symposium/Workshop on Applications of Expert Systems in DND Apr. 1992 p 15-34 (For primary document see N94-33335 09-66)
Avail: Issuing Activity (Royal Military Coll. of Canada, Vimy Post Office, Kingston, ON K7K 5L0 Canada)

A main goal of electronic warfare (EW) is to identify enemy units and determine their intentions. This is accomplished through the analysis of data obtained by EW support measures (ESM). One of the techniques employed by EW analysts is to use deployment templates as defined in doctrinal publications to predict the deployment and intentions of the enemy forces being faced. A prototype decision support system (DSS) has been written in the Smalltalk programming language to make use of doctrinal templates to assist EW analysts in estimating enemy locations, identities, and intentions. The DSS consists of a window-based user interface plus interfaces with the following: a database of doctrinal templates, a tactical database, an inference calculator, and a database of inferred templates to search the tactical database for a possible match to a selected template or an element of it. The DSS also has the ability to compute a certainty factor for each match. A template database browser is provided to allow entering of different doctrinal templates in a database. The use of the DSS is reviewed, with illustrations of the database browser displays and search results. Initial reactions to the DSS suggest that it is a tool that will greatly enhance the working environment of EW analysts. Author (CISTI)

SCHEDULING FIGHTER MISSIONS USING AN EXPERT SYSTEM WITH AN OPERATIONS RESEARCH MODULE
J. Genest, L. Lefebvre, G. Savard, and M. Vachon *In* Royal Military Coll. of Canada, Proceedings of the Symposium/Workshop on Applications of Expert Systems in DND Apr. 1992 p 35-48 (For primary document see N94-33335 09-66)
Avail: Issuing Activity (Royal Military Coll. of Canada, Vimy Post Office, Kingston, ON K7K 5L0 Canada)

Aircraft serviceability is the ratio between the number of aircraft ready for flight and the total number available. One of the main goals in scheduling missions is to maintain a high serviceability rate while meeting operational and training requirements. This is a complex problem for aircraft maintainers since aircraft may break down unexpectedly after missions, making it difficult to follow a preset schedule. A three-step approach is proposed which combines an expert system, an optimization module, and a critique module to assist aircraft maintainers and operators in the production of a mission schedule. The approach first prepares an initial schedule using an optimization model. The expert system then reviews the schedule to enforce domain specific heuristics based on the experience of maintainers and operators. The schedule is then evaluated by maintainers in conjunction with a critique module which, using machine learning techniques, will refine the heuristics used by the expert system. This approach is currently being developed for a F-18 squadron using an expert system shell called ART-IM and an operations research system running on a personal computer. Favorable results were obtained from each module and they are now being integrated in an application running in the Microsoft Windows environment. Author (CISTI)

THE CF-18 DIAGNOSTIC AND MAINTENANCE EXPERT SYSTEM PROJECT **c01**
J. B. Tubman, M. D. Brinsmead, C. C. Lumb, M. M. Mendoza, and I. S. L. Tan *In* Royal Military Coll. of Canada, Proceedings of the Symposium/Workshop on Applications of Expert Systems in DND Apr. 1992 p 74-92 (For primary document see N94-33335 09-66)
Avail: Issuing Activity (Royal Military Coll. of Canada, Vimy Post Office, Kingston, ON K7K 5L0 Canada)

A feasibility study is being conducted to investigate the appropriateness and practicality of applying expert system technologies to the maintenance of CF-18 aircraft. The target application is two radar test sets, designated AN/USM-469, for testing and fault isolating replaceable subassemblies of the CF-18 AN/APG-65 radar. There are 72 different subassemblies that can be connected to the test sets, and the study concentrated on the radar transmitter as the unit under test. The test program for the radar transmitter contains a sequence of at least 160 test procedures partitioned into 14 groups, the first eight of which must be performed in a given sequence and the last six may be reordered according to the procedure most likely to find a reported fault. The purpose of the expert system would be to assist technicians in making this sequencing decision. The approach taken to accomplish this task is described with reference to the general and special resequencing problems, design and implementation of the test system database, and field testing. It was concluded that the expert system approach is not likely to yield a significant speedup in maintenance time for radar transmitters. The approach was impeded by the need to rerun unneeded safety tests many times if a lot of resequencing takes place. Author (CISTI)

AN EXPERT SYSTEM APPLICATION FOR TROUBLESHOOTING THE CF18 F404 ENGINE **c07**
W. D. E. Allan and R. C. Best *In* Royal Military Coll. of Canada, Proceedings of the Symposium/Workshop on Applications of Expert Systems in DND Apr. 1992 p 93-101 (For primary document see N94-33335 09-66)
Avail: Issuing Activity (Royal Military Coll. of Canada, Vimy Post Office, Kingston, ON K7K 5L0 Canada)

Troubleshooting the CF-18 F404 engine often involves referring to data recorded by the Inflight Engine Condition Monitoring System (IECMS), which routinely records engine and aircraft parameters during flight. A software suite has been developed for graphically presenting these data. Troubleshooting procedures have been amended to include the analysis of the plots, focusing on features unique to known faults. An expert system application is proposed to provide assistance to technicians in utilizing this information in the troubleshooting process. The ability of the system to recognize the fault signatures and to be readily updated with new patterns will be central to the success of the proposed application. The role of the system in supporting second and third line maintenance activities is also discussed. An overriding consideration in the application of expert system technology to the maintenance of the F404 engine is the necessity to maintain the level of expertise of the technicians. The system will provide recommendations for solutions, but final maintenance decisions must always rest with the technician. Author (CISTI)

A DIAGNOSTIC EXPERT SYSTEM FOR DIGITAL CIRCUITS **c33**
R. W. Backlund and J. D. Wilson *In its* Proceedings of the Symposium/Workshop on Applications of Expert Systems in DND Apr. 1992 p 102-112 (For primary document see N94-33335 09-66)
Avail: Issuing Activity (Royal Military Coll. of Canada, Vimy Post Office, Kingston, ON K7K 5L0 Canada)

A scheme is presented for a diagnostic expert system which is capable of troubleshooting a faulty digital circuit or producing a reduced test vector set for a non-faulty digital circuit. It is based on practical fault-finding logic

and utilizes artificial intelligence techniques. The program uses expert knowledge comprised of two components: that which is contained within the program in the form of rules and heuristics, and that which is derived from the circuit under test in the form of specific device information. Using both forward and backward tracking algorithms, signal paths comprised of device and gate interconnections are identified from each output pin to the primary input pins which have effect on them. Beginning at the output, the program proceeds to validate each device in each signal path by forward propagating test values through the device to the output, and backward propagating the same values to the primary inputs. All devices in the circuit are monitored for each test applied and their performance is recorded. Device or gate validation occurs when the recorded history shows that a device has been toggled successfully through all necessary states. When run on a circuit which does not contain a fault, the program determines a reduced test vector set for that circuit. Author (CISTI)

MANAGEMENT OF UNCERTAINTY IN KNOWLEDGE-BASED SYSTEMS: A MILITARY PERSPECTIVE **c82**

M. C. McKean, J. Fugere, and L. Niem *In its* Proceedings of the Symposium/Workshop on Applications of Expert Systems in DND Apr. 1992 p 113-132 (For primary document see N94-33335 09-66)

Avail: Issuing Activity (Royal Military Coll. of Canada, Vimy Post Office, Kingston, ON K7K 5L0 Canada)

An overview is provided of the uncertainty management problem. Uncertainty management approaches using knowledge based systems must process both qualitative and quantitative information. Implemented systems capable of solving or assisting in the solution of practical problems can be classified as first-, second-, and next-generation systems. These systems range in their approach to uncertainty management from rigid add-on techniques for the case of rule-based first generation systems to multiple approaches for next generation systems. Evidence is presented to show that knowledge based systems, where wisely applied, can lead to a more efficient and effective military. A case study is described which uses the Bayesian reasoning tool (BaRT) in identifying whether an aircraft is friend or foe. The BaRT approach is based on the contention that hypotheses and relations in a given domain can be represented in a network of low-order probabilistic relationships between clusters of semantically related hypotheses. BaRT has been successfully applied to a number of military classification problems. Author (CISTI)

KNOWLEDGE ENGINEERING FOR PACES, THE PARTICLE ACCELERATOR CONTROL EXPERT SYSTEM **c73**

P. C. Lind, W. F. S. Poehlman, J. W. Stark, and T. Cousins *In* Royal Military Coll. of Canada, Proceedings of the Symposium/Workshop on Applications of Expert Systems in DND Apr. 1992 p 133-152 (For primary document see N94-33335 09-66)

Avail: Issuing Activity (Royal Military Coll. of Canada, Vimy Post Office, Kingston, ON K7K 5L0 Canada)

The KN-3000 used at Defense Research Establishment Ottawa is a Van de Graaff particle accelerator employed primarily to produce monoenergetic neutrons for calibrating radiation detectors. To provide training and assistance for new operators, it was decided to develop an expert system for accelerator operation. Knowledge engineering aspects of the expert system are reviewed. Two important issues are involved: the need to encapsulate expert knowledge into the system in a form that facilitates automatic accelerator operation and to partition the system so that time-consuming inferencing is minimized in favor of faster, more algorithmic control. It is seen that accelerator control will require fast, narrowminded decision making for rapid fine tuning, but slower and broader reasoning for machine startup, shutdown, fault diagnosis, and correction. It is also important to render the knowledge base in a form conducive to operator training. A promising form of the expert system involves a hybrid system in which high level reasoning is performed on the host machine that interacts with the user, while an embedded controller employs neural networks for fast but limited adjustment of accelerator performance. This partitioning of duty facilitates a hierarchical chain of command yielding an effective mixture of speed and reasoning ability. Author (CISTI)

THE HYPERMEDIA TECHNOLOGY AS FRONT END TO KNOWLEDGE PROCESSING SYSTEMS **c82**

P. R. Roberge *In its* Proceedings of the Symposium/Workshop on Applications of Expert Systems in DND Apr. 1992 p 153-168 (For primary document see N94-33335 09-66)

Avail: Issuing Activity (Royal Military Coll. of Canada, Vimy Post Office, Kingston, ON K7K 5L0 Canada)

A major challenge to the development of expert systems is the development of high-grade user interfaces. Hypertext technology is ideally suited to facilitate the design of intuitive user interfaces for decision support systems. Some of the inefficiencies of expert systems can be overcome by integrating the features of hypertext and some of the weaknesses in hypertext systems can be overcome by using expert systems. This complementarity is illustrated with examples from systems recently developed to either the prototype level or simply as proof of concept for teaching or training applications. Two commercial hypertext products, Ntergaid's HyperWriter and OWL International's Guide were selected to create a hypertext interface to some expertise management systems. Four projects are reviewed: a flexible knowledge based system for management of chemical power source systems aboard aircraft; a failure analyst to support personnel involved with stress corrosion cracking problems; and expert systems on corrosion prevention coatings and information processing for materials performance. A PROBLEM-SOLVING APPROACH TO KNOWLEDGE ACQUISITION **c82**

J. G. Dumais and A. L. Jenkins *In its* Proceedings of the Symposium/Workshop on Applications of Expert Systems in DND Apr. 1992 p 169-188 (For primary document see N94-33335 09-66)

Avail: Issuing Activity (Royal Military Coll. of Canada, Vimy Post Office, Kingston, ON K7K 5L0 Canada)

Current approaches to knowledge acquisition (KA) are primarily prototyping and modelling. Many expert system (ES) projects developed under both approaches never result in a working system because of deficiencies in the ES development process. A KA methodology is defined which should solve some of these problems and consequently make ES's more affordable. A phased development process is proposed. The methodology uses the characteristics of the task to determine first the problem solving model which best resembles the strategy used by the expert in solving problems. Furthermore, this problem solving model suggests the relevant knowledge types as well as the general structure in which they must be represented to be useful in solving problems. Based on this information, the methodology suggests appropriate techniques to further assist the knowledge engineer in the iterative elicitation of the relevant knowledge types. Finally, the elicited knowledge is validated.

A NEURAL NETWORK APPLICATION TO SEARCH AND RESCUE SATELLITE AIDED TRACKING (SARSAT) **c18**

Ivan W. Taylor and Michel O. Vigneault *In* Royal Military Coll. of Canada, Proceedings of the Symposium/Workshop on Applications of Expert Systems in DND Apr. 1992 p 189-201 (For primary document see N94-33335 09-66)

Avail: Issuing Activity (Royal Military Coll. of Canada, Vimy Post Office, Kingston, ON K7K 5L0 Canada)

The Search and Rescue Satellite Aided Tracking (SARSAT) system uses polar orbiting satellites to monitor the earth's surface for emergency locator transmitters (ELT's). A detected ELT signal is retransmitted to ground facilities for processing. The ELT location is determined by fitting a Doppler curve to the signal, and this location estimate is then sent for transmission to a rescue unit for action. The heuristic based approach to predict the location accuracy category of SARSAT hits based on the parameters of the Doppler curve fit work reasonably well but are far from ideal. They consistently have difficulty identifying very good solutions when they occur and very poor solutions when they occur. Normal data fitting techniques based on multiple linear regression do not work well because SARSAT data are inherently nonlinear. Neural networks were thus applied

to SARSAT data as a nonlinear data fitting technique. A neural network program was trained on a sample of 173 observations and tested on a sample of 172 observations. Results are compared to the current method. Although the results so far have been promising, they are still far from ideal. Other artificial intelligence technologies such as fuzzy logic, expert systems, and inductive learning are being investigated to enhance the neural network approach. Author (CISTI)

A HEURISTIC MULTIPLE TARGET TRACKER **c32**
J. C. F. Beaupre, M. Farooq, and J. M. J. Roy *In its* Proceedings of the Symposium/Workshop on Applications of Expert Systems in DND Apr. 1992 p 218-237 (For primary document see N94-33335 09-66)
Avail: Issuing Activity (Royal Military Coll. of Canada, Vimy Post Office, Kingston, ON K7K 5L0 Canada)

The potential of applying recent developments in expert systems to multiple target tracking (MTT) is investigated. Standard MTT algorithms can generate relatively unreliable target state estimates. The multiple hypotheses tracker (MHT) is a very powerful algorithm, and demanding in computer resources, which can handle difficult situations by differing the formulation of hard decisions and which forms hypothetical tracks with associated probability values. It is proposed that heuristics can be formulated to improve MHT performance. These rules act on the tracks, hypotheses, and corresponding probability values to decide which hypotheses are most representative of reality. In effect, the MHT algorithm is modified to accept and process knowledge of the context or environment in which it operates and on its own strengths and weaknesses. To evaluate the performance of this concept, a prototype has been built which simulates the environment of a small military flight training school as viewed through the returns of a modified area surveillance radar. In a scenario involving nine targets behaving within regulated directives, the tracking prototype successfully displays timely, accurate, and dependable information. Author (CISTI)

STRICTLY POSITIVE DEFINITE FUNCTIONS ON SPHERES Summary Report
Amos Ron and Xingping Sun Feb. 1994 23 p
(Contract NSF DMS-92-24748; DAAL03-90-G-0090)
(AD-A276471; CMS-TSR-94-6) Avail: CASI HC A03/MF A01

In this paper we study strictly positive definite functions on the unit sphere of the m-dimensional Euclidean space. Such functions can be used for solving a scattered data interpolation problem on spheres. Since positive definite functions on the sphere were already characterized by Schoenberg some fifty years ago, the issue here is to determine what kind of positive definite functions are actually strictly positive definite. The study of this problem was initiated recently by Xu and Cheney, where certain sufficient conditions were derived. A new approach, which is based on a critical connection between this problem and that of multivariate polynomial interpolation on spheres, is presented here. The relevant interpolation problem is subsequently analyzed by three different complementary methods. The first is based on the de Boor Ron general least solution for the multivariate polynomial interpolation problem. The second, which is suitable only for $m = 2$, is based on the connection between bivariate harmonic polynomials and univariate analytic polynomials, and reduces the problem to the structure of the integer zeros of bounded univariate exponentials. Finally, the last method invokes the realization of harmonic polynomials as the polynomial kernel of the laplacian, thereby exploiting some basic relations between homogeneous ideals and their polynomial kernels. THE INTERPRETATION OF FREE FOCUS
Noor vanLeusen and Laszlo Kalman Jul. 1993 41 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0928-3293)
(CL-93-01; ETN-94-96007) Avail: CASI HC A03

An analysis of the interpretation focus, that is, focus which is not 'bound' by a focusing adverb, is presented. Utterances containing free focus act as answers to questions or as replies; thus, their use is contextually more restricted than that of bound focus. Utterances containing free focus can only occur felicitously in certain licensing contexts so, in a sense, free focus is 'bound' by the context. A claim that these licensing contexts can be characterized in terms of an exhaustivity requirement on the antecedent of the focused constituent is made. Free focus is defined, starting from the concept of focus as the most prominent constituent of an utterance. A distinction is made between free focus and three other types of prominent elements: contrastive topic, comment, and bound focus. The semantics of free focus are outlined, with special regard to the contextual prerequisites of using it. Generally recognized conditions are explained, which turn out to be necessary but not sufficient conditions. An additional condition, called the exhaustivity condition, is introduced. The proposal is justified by examining the various constructions in which free focus is involved. A distinction between various functions that focusing can have is made, and the various linguistic expression types that can be focused are reviewed. Certain requirements on the features that a formal semantic theory should have in order to account for the facts related to free focus are formulated. ESA

RESUMPTIVE QUANTIFIERS IN EXCEPTION SENTENCES
Friederike Moltmann (California Univ., Los Angeles.) Oct. 1993 29 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0928-3307)
(LP-93-11; ETN-94-96003) Avail: CASI HC A03

A study of what appears to be a clear instance of polyadic quantification in natural language, namely, polyadic quantification in exception sentences, is presented. In connection with this, a semantic analysis of exception constructions in general is also presented. Various results concerning exception sentences with polyadic quantifiers are presented. In particular, it is shown that even though the polyadic quantifiers which exception phrases may apply to are iterations of monadic quantifiers and hence reducible polyadic quantifiers in Keenan's sense, the resulting quantifiers are not generally reducible, that is, they are not generally expressible as iterations of monadic quantifiers. BINARY QUANTIFIERS AND RELATIONAL SEMANTICS
Natasha Alechina 8 Nov. 1993 37 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0928-3307)
(LP-93-13; ETN-94-96004) Avail: Issuing Activity (European Space Agency (ESA))

An attempt to extend the treatment of unary generalized quantifiers proposed by van Lambalgen and van Benthem and Alechina to the binary case is presented. A binary quantifier IIx(phi, psi) can be understood as 'typically, phi's are psi's'. After investigating some formal properties of these quantifiers, an embedding of predicate conditional logic into a logic with binary quantifiers is defined and possible applications of binary quantifiers in formalizing defeasible reasoning are discussed. Questions concerning independent axiomatizations of logics are addressed. A solution to the following problem, connected with efforts to describe the lattices of all normal modal and intermediate logics, is given: whether or not every normal or intermediate logic has an independent set of axioms. EXTENSIONAL REALIZABILITY

Jaap vanOosten 30 Sep. 1993 30 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ML-93-18; ETN-94-95994) Avail: CASI HC A03

Extensional realizability, a modification of Kleene's original definition, where a notion of 'x and y are equivalent as realizers of A' is built in, and where it is then required that realizers of A to B code operations which send equivalent realizers of A to equivalent realizers of B, is addressed. Inductive definitions for two approaches to do this are presented. It is shown that r(sub e) and e realizability are not equivalent as interpretations of intuitionistic Heyting arithmetic HA. A characterization of e realizability over a conservative extension HA(sup infinity) of HA + Markov's principle is obtained. More precisely, HA(sup infinity) has variables alpha of a new sort, and the notion 'alpha realizes A' for formulas A in the extended language is defined. Toposes generalizing notions of extensional realizability in the same way as Hyland's 'effective topos' generalizes Kleene's realizability are addressed. ESA

THE DECIDABILITY OF DEPENDENCY IN INTUITIONISTIC PROPOSITIONAL LOGIC

L. A. Chagrova (Tver State Univ., Russia.) and Dick DeJongh Nov. 1993 13 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0928-3315)

(ML-93-20; ETN-94-95996) Avail: CASI HC A03

A definition is given for formulae A(sub 1), ..., A(sub n) in some theory T which is formalized in a propositional calculus S to be independent with respect to S. It is shown that, for intuitionistic propositional logic IPC, dependency (with respect to IPC itself) is decidable. This is an almost immediate consequence of Pitts' uniform interpolation theorem for IPC. A reasonably simple infinite sequence of IPC formulae F(sub n)(p, q) is given such that IPC formulae A and B are dependent if and only if at least one of the F(sub n)(A, B) is provable. ESA

The semantics of plural noun phrases is addressed in a study on systematic ways to combine the standard theory of quantification with the sum theory of collections. The research is carried out within an extensional type theory. In such a framework the theories can be connected by giving ways to transform determiners in type ((et)((et)t)), that is, relations between sets, to ones in type ((et)(((et)t)t)), that is, relations between sets and sets of sets. It is assumed for simplicity that common nouns only hold of individuals (denote sets) and that only verb phrases are collective (denote sets of sets). Given that collections viewed as sums may be identified with sets, such 'lifted' determiner denotations are suitable to be used in a collective setting. ESA

EFFECTIVE TRUTH

G. K. Dzhaparidze 21 Sep. 1993 29 p Sponsored by Netherlands Organization for Scientific Research Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0928-3315)

(ML-93-15; ETN-94-95991) Avail: CASI HC A03

The notion of effective truth defined in terms of game (dialogue) semantics and very much resembling recursive realizability is introduced. This notion seems to be a natural alternative for the classical notion of truth which satisfies the 'constructivistic' demands. At the same time it serves as a natural justification of 'resource conscious' effects reflected in substructural logics, the logic corresponding to effective truth is a version of linear logic. ESA

CORRESPONDENCE THEORY FOR EXTENDED MODAL LOGICS, VERSION 3.0

Maarten deRijke Oct. 1993 33 p Sponsored by Netherlands Foundation for Philosophical Research Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0928-3315)

(ML-93-16; ETN-94-95992) Avail: CASI HC A03

Issues of reducibility of modal conditions to first order formulas are addressed. The Sahlqvist van Benthem and Gabbay Ohlbach Simmons algorithms are studied and extended. The central notion, correspondence and reducibility is defined; roughly speaking, a formula is reducible for certain variables if it is equivalent to a formula in which those variables do not occur. For most practical purposes actual reductions are obtained by making appropriate substitutions for the forbidden variables. An analysis of what makes the Sahlqvist van Benthem and Gabbay Ohlbach Simmons algorithms work is made; the analysis involves both a semantic description of the substitution mechanisms, and a syntactic characterization of the formulas allowing such substitutions. A less algorithmic perspective is adopted, and reducibility results are obtained by imposing restrictions on languages and their interpretations. A frequent complaint about the actual use of the Sahlqvist van Benthem algorithm has been its alleged obscurity, so special attention is given to using the algorithms. ESA

UPDATES IN DYNAMIC SEMANTICS

Paul Dekker 28 May 1993 46 p Sponsored by EEC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0928-3307)

(LP-93-06; ETN-94-95998) Avail: CASI HC A03

A reformulation of Groenendijk and Stokhof's system of dynamic predicate logic (DPL) as an update semantics is given. The basic semantic notion is that of update of information about the values of variables. It is shown that the dynamics of interpretation involved, and the validity of certain classical logical equivalences, can be more precisely characterized in the update formulation of DPL. The system is shown to be extended with a perspicuous and uniform account of adnominal and adverbial quantification (symmetric as well as asymmetric). ESA

WEAKS VS. STRONG READINGS OF DONKEY SENTENCES AND MONOTONICITY INFERENCE IN A DYNAMIC SETTING

Makoto Kanazawa (Stanford Univ., CA.) Oct. 1993 49 p Submitted

for publication Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0928-3307)
(LP-93-10; ETN-94-96002) Avail: CASI HC A03

A study showing that the availability of what some authors have called the weak reading and the strong reading of donkey sentences with relative clauses is systematically related to monotonicity properties of the determiner is presented. The correlation is different from what has been observed in the literature in that it concerns not only right monotonicity, but also left monotonicity (persistence/antipersistence). A claim that the reading selected by a donkey sentence with a double monotone determiner is in fact the one that validates inference based on the left monotonicity of the determiner is made. This accounts for the lack of strong reading in donkey sentences with MON determiners, which have been neglected in the literature. The relevance of other natural forms of inference is considered and it is suggested how monotonicity inference might play a central role in the actual process of interpretation. The formal theory is couched in dynamic predicate logic with generalized quantifiers. ESA

Rigorous calculations of cross sections and rate constants for elementary gas phase chemical reactions are performed for comparison with experiment, to ensure that our picture of the chemical reaction is complete. We focus on the H/D + H2 yields H2/DH + H reaction, and use the time independent integral equation technique in quantum reactive scattering theory. We examine the sensitivity of H + H2 state resolved integral cross sections sigma(sub v-prime j-prime, vj)(E) for the transitions (v = 0, j = 0) to (v-prime = 1, j-prime = 1, 3), to the difference between the Liu - Siegbahn - Truhlar - Horowitz (LSTH) and double many body expansion (DMBE) ab initio potential energy surfaces (PES). This sensitivity analysis is performed to determine the origin of a large discrepancy between experimental cross sections with sharply peaked energy dependence and theoretical ones with smooth energy dependence. We find that the LSTH and DMBE PESs give virtually identical cross sections, which lends credence to the theoretical energy dependence. DOE

I present the results of my work aimed at making Regge Calculus a practical tool for numerical relativity. The principal results are a formalism for solving the Regge equations in the general case, a working software package r(3)+1 which implements these methods, and a collection of numerical results produced by this software. The formalism for solving the Regge equations consists of a set of algorithms for constructing and analyzing arbitrary simplicial lattices, calculating deficit angles, and (for the first time) calculating the Jacobian of the Regge equations. I also present a definition of lapse and shift in Regge Calculus. At this time, the software package consists of approximately ten thousand lines of C++ code which offer a user interface, lattice analysis routines, and routines to calculate and solve the Regge equations with arbitrary choice lapse and shift. The Regge equations are solved using Newton's method and conjugate gradient methods. The numerical runs presented here (1) confirm the validity of the methods used; (2) examine the structure of diffeomorphism freedom in Regge Calculus, giving the first verification that one can choose lapse and shift freely; (5) examine the Bianchi identities and quantify the extent to which time evolution in Regge Calculus preserves constraints, finding that the constraints are proportional to the third power of the lattice spacing.

For a quantum group, G, the notion of quantum homogeneous G-space is defined. Two methods to construct such spaces are discussed. The first one makes use of quantum subgroups, the second more general one is based upon the notion of infinitesimal invariance with respect to certain two sided coideals in the Hopf algebra dual to the Hopf algebra of G. These methods are applied to the quantum group SU(2). As two sided coideals, the subspaces spanned by twisted primitive elements in the sl(2) quantized universal enveloping algebra are taken. A one parameter series of mutually nonisomorphic quantum 2-spheres is obtained, together with the spectral decomposition of the corresponding right regular representation of quantum SU(2). The link with the quantum spheres defined by Podles is established. ESA

The basic problem addressed in the project was that of accelerating the iterative convergence of Discrete Ordinates (S(sub N)) problems. Important previous work on this problem, much of which was done at LANL, has shown that the Diffusion Synthetic Acceleration (DSA) method can be a very effective acceleration procedure. However, in two-dimensional geometries, only the diamond differenced S(sub N) equations have been efficiently solved using DSA. This is because, for the 2-D diamond-differenced S(sub N) equations, the standard DSA procedure leads to a relatively simple discretized low-order diffusion equation that for many problems can be efficiently solved by a multigrid method. For other discretized versions of the S(sub N) equations, the standard DSA procedure leads to much more complicated discretizations of the low-order diffusion equation that have not been efficiently solved by multigrid (or other) methods. In this project, we have developed a new procedure to obtain discretized diffusion equations for DSA-accelerating the convergence of the S(sub N) equations using certain lumped discontinuous finite element spatial differencing methods. The idea is to use an asymptotic analysis for the derivation of the discretized diffusion equation. This is based on the fact that diffusion theory is an asymptotic limit of transport theory. The asymptotic analysis

also shows that the schemes considered in this project are highly accurate for diffusive problems with spatial meshes that are optically thick. Specifically, we apply this DSA procedure to a lumped Linear Discontinuous (LD) scheme for slab geometry and a lumped Bilinear Discontinuous (BLD) scheme for x,y-geometry. Our theoretical and numerical results indicate that these schemes are very accurate and can be solved efficiently using the new method. We describe the concept that underlies the DSA method. We describe the basic asymptotic relationship between transport and diffusion theory. DOE

REGULAR WAVELETS: APPLICATION TO FIXED IMAGE COMPRESSION Ph.D. Thesis [ONDELETTES REGULIERES: APPLICATION A LA COMPRESSION D'IMAGES FIXES]
Olivier Rioul 1993 254 p In ENGLISH and FRENCH Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0751-1353)
(TELECOM-93-E-004; ETN-94-95897) Avail: Issuing Activity (European Space Agency (ESA))

The study of the effect of new mathematical properties brought by wavelet theory on subband coding, for still image compression problems, is addressed. Using a theoretical analysis of discrete time multiresolution decomposition, it is shown that, within the framework, the practical novelty of wavelets reduces to the 'regularity' property of octave band filter banks used in subband coding schemes. Tools which make a systematic study of regularity possible, for applications such as image compression, are derived. A mathematical study of the regularity property is investigated, in which optimal regularity estimation algorithms are derived. Several filter bank design algorithms are proposed, which can balance regularity against other filter properties (orthogonality, linear phase response, frequency selectivity, etc.) which are generally believed to be relevant for image coding. Fast algorithms are derived, for which substantial reduction of computational load required by octave band filter banks is possible. An experimental study of filter properties is carried out, for a simple still image compression scheme, in which the wavelet transform is separable. In this restricted framework, the potential interest of regularity is emphasized, in competition with other criteria such as frequency selectivity and linear phase. ESA

Element-specific magnetic hysteresis measurements on heteromagnetic materials have been achieved by using circularly polarized soft x-rays. Dramatically different Fe and Co hysteresis curves of Fe/Cu/Co trilayers were obtained by recording the magnetic circular dichroism (MCD) at their respective L(sub 3) white lines as a function of applied magnetic field. The data resolve the complicated hysteresis curves, observed by conventional magnetometry, and determine the individual magnetic moments for the Fe and Co layers. Fine hysteresis features, imperceptible in the conventional curves, were also observed, demonstrating a new application of circularly polarized soft x-rays in the investigation of magnetic systems. PENETRATION DISTANCES AND THEIR APPLICATIONS TO PATH PLANNING Ph.D. Thesis
Chong Jin Ong 1993 183 p
Avail: Univ. Microfilms Order No. DA9319601

The proximal relationship of two objects is of interest for many reasons, e.g., the interference detection problem in robot motion planning. When the mathematical representations of two objects are separated the natural measure of the proximal relationship is the shortest Euclidean distance. However, much less is known when the representations intersect. In this dissertation, one of the main foci is the characterization and computation of measures of the proximal relationship between two intersecting objects. We call these measures penetration distances. A formal exposition of penetration distances and their mathematical properties is given. A penetration distance is defined by the least 'movement' needed to separate the two objects. In general, 'movement' involves both rotation and translation. Several ways of measuring the degree of rotation and translation are introduced and each yields a different definition of penetration distance. In the special case of convex objects, it is shown that the various penetration distances are the same and are determined from translational motion alone. The above-mentioned penetration distances are difficult to compute. An important contribution of this thesis is the development of a new penetration distance based on ideas of 'growing' the mathematical representations of objects. It is called the growth distance and can be computed easily for a pair of convex objects. The mathematical properties and computational aspects of the growth distance are developed at length. For instance, its relationship to the other penetration distances is determined. When two objects are separated, the growth distance is also a measure of separation. An important application of the growth distance is to path finding for robotic systems in the presence of obstacles. Our approach is to convert the path finding problem into an optimization problem. The objective is to minimize the 'amount' of collision along the path. This novel approach

involves searching among collision paths. Problems unique to this formulation are discussed. Our approach has several advantages over existing approaches and has performed well in several examples. Dissert. Abstr.

NONLINEAR ANALYSIS OF SPRINGS USING HELICAL FINITE ELEMENTS Ph.D. Thesis
David Allen Bruner 1993 92 p
Avail: Univ. Microfilms Order No. DA9321508

The coil spring is one of the most commonly used components in mechanical systems. Its versatility as an energy storage device stems from its unique geometry. A spring has greatly different characteristics if all of its useful energy storage modes, such as compression, extension, torsion, and lateral bending, are considered. The analysis of these modes encompassing all of the deformations present in the wire, including shear deformation and axial deformation along the wire centerline, is difficult to obtain analytically. The phenomenon of large geometric deformation can frequently occur with a loaded spring and further complicate the analysis. In this work, the geometry of a generalized helix is the basis for a finite element. This finite element exactly matches the shape of springs with variable radius and pitch. This generality in shape combined with inclusion of shear and axial deformation modes gives a complete tool for the accurate modeling of springs. A nonlinear large deflection technique previously developed for two dimensional large deflection studies is extended to three dimensions for use with the helical finite element. An iterative technique, based on fictitious forces which correct geometric nonlinearities, enables analysis of spring loading cases which cause large nonlinear deformations. The helical finite element is verified by means of linear and nonlinear numerical test cases. Experimental tests are designed and conducted to evaluate the effectiveness of the model. The results of these numerical and experimental tests are presented and demonstrate the accuracy of the developed model. Dissert. Abstr.

The primary objectives of this research are the development of algorithms which are applicable to non-linear continuum mechanic problems, especially to Stefan's Problems and Fluid Flows in Porous Media (Richard's Equation). We have studied 2-D and 3-D related problems. The codes are written in Cray Fortran and vectorization is done on the Cray Y-MP. The results obtained by Compact ADI, Finite Difference SOR and ADI are compared. It is seen that Compact ADI is superior. Six scientific research papers have been presented/published in various conferences and journals in the last two years. All of the papers are attached in the appendix as attachments. Author

MODELLING THE LATE PART OF ROOM IMPULSE RESPONSES USING ADAPTIVE FILTERING: ON THE RECREATION OF REALITY
Sven Landstroem and Jan Skoglund 1993 45 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0283-8338)
(CTH-E-93-01; ETN-94-95949) Avail: Issuing Activity (European Space Agency (ESA))

The late part of a monaural Room Impulse Response (RIR) was modeled using statistical methods in order to explore possible redundancies. This type of modeling can, for example, be used to simplify synthetization of RIR's or to decrease the storage needs. By regarding the impulse response as time series and applying system identification theory, an ARMA filter can be used to reproduce the late part Finite Impulse Response (FIR) coefficients from a Gaussian white noise sequence. To investigate the audible differences between the original and a modeled RIR, listening tests were performed. Three anechoic source signals convolved with the RIR's were presented to 9 listeners (all musicians). The tests indicated that differences were not audible to the average listener, even though one listener consistently detected all differences. ESA

Psychoacoustic testing of Room Impulse Responses (RIR), using editing techniques and listening tests with help of auralization is considered. Using these techniques the question of when the reverberation tail is subjectively diffuse was studied. This question is of great interest, for example for auralization techniques. Binaural Room Impulse Responses (BRIR's) were measured in two positions in a concert hall. Their respective reverberation tails were substituted by editing. Listening tests indicated that even with a connection time of 400 ms, some test persons could consistently detect differences with speech as source signal. With music (piano) as source signal the 'limit' of the diffuse part was somewhere between 200 to 400 ms. In the second listening test an individual reflection was substituted with a diffuse one by editing. Three types of diffuse reflections were used. The results indicated that it is possible to improve the subjective quality with a diffuse reflection. Furthermore the character of the diffuse reflection is significant. ESA

A PILOT STUDY OF COMFORT CRITERIA AND SOUND QUALITY METRICS FOR SOUND INSIDE CABINS OF PROPELLER-DRIVEN AIRCRAFT
Mendel Kleiner Mar. 1993 49 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract NUTEK-92-05162P) (ISSN 0283-832X)
(CTH-F-93-03; ETN-94-95948) Avail: Issuing Activity (European Space Agency (ESA))

A pilot study on comfort criteria and sound quality metrics for aircraft interior cabin sound due to propeller and aerodynamic noise is presented. Literature searches on these subjects were made using various international data bases. Several suggested metrics are reviewed. Some results using aircraft sound data are reported. Using a personal computer based system with a signal acquisition/replay board and commercial software it was possible to successfully change the sound quality of recorded propeller aircraft noise signals in several ways. An audio demonstration tape of some of these test signals is available in R-DAT format. A strategy for work in the fields of metrics, sound comfort and sound quality for aircraft interior cabin sound is outlined. Currently available software and hardware for sound quality work are reviewed and short summaries of a number of related articles and papers are featured. ESA

The prediction of the acoustic environment of a launcher at takeoff is made possible by the following simplifications: the launcher is represented by a portion of an infinite cylinder and the incident acoustic field is compared to a superposition of plane waves. The analytical formulation for the scattered field induced by a plane wave is reviewed and the random case is investigated under two aspects: acoustic pressure generated on the cylinder wall, and space correlation functions of the resulting field. The above theoretical concepts allow, using measurements carried out during the firing test of captive Ariane 5 scale model, the proposal of a separation method of the assumed components (lateral and vertical) of the incident acoustic field, modelized by uncorrelated plane waves. This approach is based on some hypotheses which may be partly specified by the simulation of the experimental cross correlation functions. It seems possible to reconstruct, using a definite number of plane waves, the entire experimental data (at least in the flow frequency range), and to characterize the acoustic field for a given test condition. A PRELIMINARY INVESTIGATION OF HIGH AMPLITUDE STANDING WAVES WITH LASER DOPPLER ANEMOMETRY M.S. Thesis
Timothy J. Corrigan 16 Nov. 1993 53 p
(AD-A276463) Avail: CASI HC A04/MF A01

A previous study of thermoacoustic heat transport phenomena reported measurements of the acoustically induced temperature difference (Delta)T generated across short, poorly thermally conducting plates situated in high amplitude acoustic standing waves. That study focused on the dependence of (Delta)T on the position of the plates in the standing wave, the mean gas pressure and acoustic pressure amplitude. For a given mean gas pressure, there was a threshold acoustic pressure amplitude above which irregularities appeared in the plots of (Delta)T vs kx. There was evidence that some velocity-dependent effect might be the cause of the discrepancies. An investigation of the acoustic velocity field in high amplitude standing waves has been initiated to determine whether there are measurable irregularities in the velocity field that can account for the observed behavior. The use of Laser Doppler Anemometry (LDA) provided accurate measurements of the velocity behavior of a gas in an empty resonator, as well as in a resonator with a crude thermoacoustic stack. Preliminary results are reported. The major conclusions are that LDA measurements of acoustic velocity fields provide reliable results and there are no significant velocity perturbations evident in our measurements. A videotape of acoustically induced flow in the resonator with a stack indicate that significant velocity perturbations do exist on time scales other than acoustic. DTIC

COMPUTER IMPLEMENTATION OF ARNOTT'S FORMULATION OF THERMOACOUSTICS USING MATLAB M.S. Thesis
Argirios L. Gamaletsos 18 Nov. 1993 72 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A276356) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This thesis describes a Matlab computer program that implements Arnott's formulation of thermoacoustics. The program calculates the resonance frequency and quality factor of a thermoacoustic prime mover below onset of self-oscillation. The results of this analysis are compared to measured values for both a closed end and an open end prime mover and to predictions of a standing wave analysis of prime movers. DTIC

INVESTIGATION OF SONIC BOOM FOR THE SPACE SHUTTLE: HIGH CROSS-RANGE ORBITER
Raymond M. Hicks, Joel P. Mendoza, and Lionel L. Levy, Jr. [1993] 12 p
(NASA-TM-108238; NAS 1.15:108238) Avail: CASI HC A03/MF A01

Recent studies of a proposed low cross-range straight-wing space shuttle orbiter have shown that the sonic boom created during reentry may be objectionable, particularly at low supersonic Mach number. Because of this, additional tests have been conducted to determine the sonic-boom overpressure for a blended wing-body shape proposed for use as a high cross-range shuttle orbiter. Two mission profiles, in which a constant angle of attack was held during the supersonic portion of the flight, were studied. In one case the angle of attack was 60 degrees; in the other 25 degrees. The sonic-boom pressure signatures were measured in a wind tunnel and used to estimate overpressures for both missions. A technique for alleviating the boom is indicated. Author (revised)

INVESTIGATION OF SONIC BOOM FOR THE SPACE SHUTTLE: LOW CROSS-RANGE ORBITER
Lionel L. Levy, Jr., Raymond M. Hicks, and Joel P. Mendoza [1993] 10 p
(NASA-TM-108237; NAS 1.15:108237) Avail: CASI HC A02/MF A01

It is desired that the Space Shuttle Orbiter be capable of landing at airports equipped to handle present-day jet transports. Since the majority of such airports are located near heavily populated areas, an investigation has been undertaken to determine whether or not the sonic boom generated during reentry of Space Shuttle Orbiters is potentially a serious problem. The investigation was concerned with the low cross-range orbiter and reentry concept proposed by Faget of the Manned Spacecraft Center (MSC). This report describes the approach used and presents the results obtained to date. Author (revised)

The basic equations describing the production of aeroacoustic sound are derived, and approximations to the basic equations are presented leading to inhomogeneous convected wave equations. Different models to describe the generation and convection of vorticity at high Reynolds numbers are described, with special attention to the so called Kutta condition, which in potential flow models accounts for the action of viscous forces at sharp edges. Results of the various potential flow methods are compared for starting flows such as the starting flow past a wedge, out of a two dimensional channel exit and in a T junction. The periodic vortex formation process in several configurations is addressed. Results of an experimental investigation into the propagation and reflection of acoustic waves in a long open ended pipe are described. Accurate experimental data on the influence of a low Mach number (turbulent) mean flow on the reflection coefficient and damping coefficient were obtained using a multimicrophone method. As an application of the computational methods, flow induced resonances in a system with two side branches, that is, in a tandem T junction and in a cross junction, are addressed. ESA

EXPERIMENTAL AND COMPUTATIONAL STUDIES ON PROPELLER NOISE DUE TO INFLOW DISTORTION Ph.D. Thesis
Srinivasan Subramanian 1993 298 p
Avail: Univ. Microfilms Order No. DA9320189

Large-scale non-uniformities in the approach flow to a propeller result in periodic unsteady blade forces that radiate tonal noise at the blade passing frequencies and its higher harmonics. The current research focuses on a combined theoretical and experimental approach to study this propeller aeroacoustic problem. The theoretical study employs the classical acoustic analogy in conjunction with two-dimensional unsteady aerodynamic theory.

The experimental side of this research is conducted in an anechoic flow facility and employs a four-bladed marine propeller. Both isolated and cyclical distortions are investigated. The radiative properties due to isolated distortions is first studied by operating the propeller behind the wake of a rod. Qualitative comparisons of the measured directivities match well with the analyses from theory. Next, the analysis is extended to cyclical distortions in the incoming flow. The theoretical analysis accounts for the effect of mean blade loading on the unsteady blade forces and provides an upper and lower bound for the resulting far field noise radiation. The experimental study employs non-uniform flow generators that provide a three-cycle and four-cycle azimuthal variation in the approach flow. An extensive comparison of the measured noise levels with the theoretical predictions shows an excellent agreement both in magnitude and directivity. Dissert. Abstr.

BOUNDARY CONTROL OF SCATTERING Ph.D. Thesis
Terence John Bazow 1993 226 p
Avail: Univ. Microfilms Order No. DA9318375

The essence of the acoustic scattering problem is to determine the acoustic fields that result from the presence of a body (scatterer) in a known ensonification field. The scattering problem is formulated as a constrained optimization problem solving for that surface admittance which minimizes radiated energy in a restricted subset of farfield directions. The imposed constraints are that the total field must satisfy the admittance boundary condition at the scatterer's surface, and the scattered field must satisfy both the Helmholtz equation and the radiation condition in the region exterior to the scatterer. For a specified surface admittance distribution, approximate solutions for the scattering problem are obtained by applying the discrete form of the axisymmetric Helmholtz integral representation coupled with a piecewise constant collocation scheme. Nonlinear minimization techniques are then used to find the admittance distribution that minimizes the scattered energy in a selected farfield angular sector. For this investigation, the scattering bodies are rotational ellipsoids and the surface admittance is both complex and axisymmetric. The ensonification field is a packet of plane waves containing a few sinusoidal waves with different frequencies or with a few directions of incidence. Three factors are found to directly affect optimization calculations for the acoustic fields that result from the scatterer's presence. First is the farfield sector over which minimization is desired. Second is the constraint imposed on the admittance distribution. The third factor is the convergence domain for the solutions to the direct scattering problem. The numerical simulations demonstrate that the Helmholtz integral representation coupled with nonlinear minimization techniques yield useful solutions. Further, the approach and numerical techniques provide credible estimates of optimal admittance distributions and the scattered fields over a range of spatial and geometric arrangements. Dissert. Abstr.

SOUND SCATTERING BY CYLINDERS OF NONCIRCULAR CROSS SECTION Ph.D. Thesis
Daniel T. DiPerna Feb. 1994 91 p
(Contract N00014-89-J-1729)
(AD-A276663; WHOI-93-47) Avail: CASI HC A05/MF A01

This thesis investigates a new method for predicting the farfield scattered pressure of a plane wave due to an infinite cylinder of noncircular cross section. Both impenetrable and penetrable fluid boundary conditions will be treated for several types of cross sections and for a large frequency range. This new method requires the conformal mapping of both the exterior and interior of a closed surface to a semi-infinite strip. Numerically efficient algorithms will be presented for both of these cases. A new method for satisfying the boundary conditions will be developed, as well as an efficient algorithm for generating the required modal functions on the boundary. Numerical results are presented for cross sections in the shape of an ellipse, square, and three leaf clover. In all cases, the results compare extremely well with exact or high frequency asymptotic results. DTIC

WAVEVECTOR-FREQUENCY ANALYSIS WITH APPLICATIONS TO ACOUSTICS
Wayne A. Strawderman 1994 574 p
(AD-A276618) Avail: CASI HC A24/MF A04

This monograph presents an approach to the description and analysis of acoustic fields and systems that parallels and extends one developed by electrical engineers to describe and analyze electrical signals and systems. This approach, called wavevector-frequency analysis, complements traditional methods of acoustics. Wavevector-frequency analysis is simply the description and interpretation of a space-time field or system in terms of the Fourier conjugates of the independent spatial and temporal variables of the field or system. The Fourier conjugate of the spatial vector variable is called the wavevector, and the Fourier conjugate of the time variable is the frequency. The formalism of this approach to acoustics evolved over the course of an extended research effort to understand and characterize certain acoustic fields associated with turbulent flow. A brief description of this research effort will put the evolution of this approach in perspective. DTIC

PULSE-SPLITTING AND AM-FM CONVERSION IN A NONLINEAR DISPERSIVE MEDIUM M.S. Thesis
William F. Coleman Dec. 1993 74 p
(AD-A277041) Avail: CASI HC A04/MF A01

Experimental and theoretical results are presented for nonlinear dispersive waveguide modes in an acoustic duct. We report observations of a localized envelope which splits into two disturbances moving with two different velocities of propagation. As a consequence, we predict that if a signal is amplitude modulated at the source, spatial beating between the two disturbances will occur, and at periodic positions in space the signal will become frequency modulated. These results can have applications in an all-optical AM-FM conversion and in high data rate fiber optic communications. DTIC

HELIPORT NOISE MODEL (HNM) VERSION 2.2 (USER'S GUIDE) Final Report, Oct. 1989 - Feb. 1994
Gregg G. Fleming and Edward J. Rickley 23 May 1994 91 p
(AD-A277072; DOT-VNTSC-FAA-94-3; DOT/FAA/EE-94-01) Avail: CASI HC A05/MF A01

The John A. Volpe National Transportation Systems Center (Volpe Center), in support of the Federal Aviation Administration, Office of Environment and Energy, has developed Version 2.2 of the Heliport Noise Model (HNM). The HNM is a computer program used for determining the impact of helicopter noise in the vicinity of terminal operations. This document, prepared by the Volpe Center's Acoustics Facility, is a User's Guide for HNM Version 2.2. It presents: (1) computer system requirements and installation procedures; (2) an overview of HNM capabilities and the user's implementation of these capabilities; (3) the elements of a heliport case study; (4) a step-by-step tutorial for preparing and running a case study; and (5) the interpretation of HNM Version 2.2 output. Also presented, in the Appendices of this document, are the following: (1) a discussion of the technical revisions made to several internal algorithms - primarily revisions which are transparent to HNM users; (2) a discussion of the helicopter noise Data Base used by the HNM; and (3) a summary of error messages in the HNM. A MATHEMATICAL MODEL FOR SIMULATING NOISE SUPPRESSION OF LINED EJECTORS
Willie R. Watson Apr. 1994 30 p

(RTOP 505-59-52-02)
(NASA-TP-3425; L-17283; NAS 1.60:3425) Avail: CASI HC A03/MF A01

A mathematical model containing the essential features embodied in the noise suppression of lined ejectors is presented. Although some simplification of the physics is necessary to render the model mathematically tractable, the current model is the most versatile and technologically advanced at the current time. A system of linearized equations and the boundary conditions governing the sound field are derived starting from the equations of fluid dynamics. A nonreflecting boundary condition is developed. In view of the complex nature of the equations, a parametric study requires the use of numerical techniques and modern computers. A finite element algorithm that solves the differential equations coupled with the boundary condition is then introduced. The numerical method results in a matrix equation with several hundred thousand degrees of freedom that is solved efficiently on a supercomputer. The model is validated by comparing results either with exact solutions or with approximate solutions from other works. In each case, excellent correlations are obtained. The usefulness of the model as an optimization tool and the importance of variable impedance liners as a mechanism for achieving broadband suppression within a lined ejector are demonstrated. Author

ACOUSTIC WINDOW Patent
David M. Bullat, inventor (to Navy), Philip C. Bradshaw, inventor (to Navy), and Jay C. Brown, inventor (to Navy) 4 Jan. 1994 7 p Filed 19 Nov. 1992
(AD-D016171; US-Patent-5,276,658; US-Patent-Appl-SN-987497; US-Patent-Class-367-174) Avail: US Patent and Trademark Office

A cost-effective, producible improved apparatus for and method of fabricating a transducer acoustic window for a marine environment has acceptable acoustic energy transmitting properties and appropriate mechanical properties to withstand the rigors associated with varying velocities of flowing water, fluctuating temperatures, changing ambient pressures, the abuse attendant operations, etc., that are routinely encountered during a prolonged deployment. The acoustic window has a cast CONAP 1556 polyurethane window portion that extends over a hull opening and on a bearing surface rim about the opening. A number of equidistantly, circumferentially spaced stainless steel inserts are molded in the cast polyurethane window portion. DTIC

BBN Systems and Technologies has been tasked by the Georgia Tech Research Center to carry Task Assignment No. 7 for the NASA Langley Research Center to explore the feasibility of 'In-Situ Experimental Evaluation of the Source Strength of Complex Vibration Sources Utilizing Reciprocity.' The task was carried out under NASA Contract No. NAS1-19061. In flight it is not feasible to connect the vibration sources to their mounting points on the fuselage through force gauges to measure dynamic forces and moments directly. However, it is possible to measure the interior sound field or vibration response caused by these structureborne sound sources at many locations and invoke principle of reciprocity to predict the dynamic forces and moments. The work carried out in the framework of Task 7 was directed to explore the feasibility of reciprocity-based measurements of vibration forces and moments. Author

The characterization of reverberation, from the surface, the bottom, and/or the volume, is important in advancing the understanding of the mechanisms involved in underwater sound scattering. Numerous experiments and much theoretical work have been done in the area of monostatic reverberation, but the area of bistatic reverberation has been much less researched. This certainly is a result of the much more complex geometries involved in bistatic reverberation. This dissertation studied the statistics of bistatic surface reverberation data from the FLIP experiment conducted in January of 1992. The data were verified as homogeneous and normally distributed using the Kolmogorov-Smirnov two-sample test with a confidence interval equal to 0.1, using a technique by which ensembles from different times were combined. Meaningful deviations from a normal distribution were observed at the highest wind speed of 7.2 m/s. DTIC

This progress report covers the period from Jan. 1993 - Jan. 1994. First, we list the papers published during the period. Next, we list the papers submitted for publication and the papers presented at scientific meetings. The personnel are then listed, and, finally we conclude with a brief discussion of the problem areas in which future research efforts will be concentrated. We feel that more research should be devoted to this topic. Not only is this research needed to understand the basic stimulus variables in more detail, but it is needed in order to apply this research to real-world situations. In most realistic situations, the change in the auditory spectrum occurs at different times and with different degrees of synchrony among the components of the complex. DTIC

In this dissertation, we will present a systematic study of structures of fullerenes ranging from C(20) to C(100) by introducing a novel scheme. Using our new scheme, we not only reproduce all known fullerene structures but also successfully predicted several other fullerene structures which were confirmed by experiments. By utilizing the tight-binding molecular-dynamic (TBMD) simulation, we also studied the dynamical behavior of fullerenes: Vibrations, thermal disintegration of individual clusters as well as collisions between fullerenes. If the beauty of carbon fullerene is not enough, people found that carbon can also form tubules and even speculated that they can form three-dimensional graphite-like networks. By extending our fullerene structure searching scheme, we performed a search for the ground-state structure of three dimensional carbon network. We found the most stable structure people ever proposed for simple cubic based networks. From the difference of this new form of carbon and graphite in the electronic and vibrational properties, we propose an experimental probe to identify these novel three-dimensional carbon networks. STATE OF HADRON COLLIDER PHYSICS
P. D. Grannis Dec. 1993 28 p Presented at the 9th Workshop on Proton-Antiproton Collider Physics, Tsukuba, Japan, 18-22 Oct. 1993
(Contract DE-AC02-76CH-03000)
(DE94-005279; FNAL/C-93/384; CONF-9310247-4) Avail: CASI HC A03/MF A01

The 9th Topical Workshop on Proton-Antiproton Collider Physics in Tsukuba Japan demonstrated clearly the enormous breadth of physics accessible in hadron colliders. Although no significant chinks were reported in the armor of the Standard Model, new results presented in this meeting have expanded our knowledge of the electroweak and strong interactions and have extended the searches for non-standard phenomena significantly. Much of the new data reported came from the CDF and D0 experiments at the Fermilab collider. Superb operation of the Tevatron during the 1992-1993 run and significant advances on the detector fronts -- in particular, the emergence of the new D0 detector as a productive physics instrument in its first outing and the addition of the CDF silicon vertex detector -- enabled much of this advance. It is noteworthy, however, that physics from the CERN collider experiments UA1 and UA4 continued to make a large impact at this meeting. In addition, very interesting summary talks were given on new results from HERA, cosmic ray experiments, on super-hadron collider physics, and on e(+)e(-) experiments at LEP and TRISTAN. These summaries are reported elsewhere. DOE

ANALYSIS OF BEAM-ON-TARGET INTERACTION IN A NEUTRON-SOURCE TEST FACILITY
A. Hassanein and D. Smith Oct. 1993 19 p Presented at the 6th International Conference on Fusion Reactor Materials, Stresa, Italy, 27 Sep. - 1 Oct. 1993
(Contract W-31-109-eng-38)
(DE94-005392; ANL/EP/CP-79740-Rev.; CONF-930928-3-Rev.) Avail: CASI HC A03/MF A01

The need is urgent for a high-flux, high-energy neutron test facility to evaluate the performance of fusion reactor materials. An accelerator-based deuterium-lithium source is generally considered the most reasonable approach to a high-flux neutron source in the near future. The idea is to bombard a high-energy (20-40 MeV) deuteron beam into a lithium jet target to produce high-energy neutrons in order to simulate a fusion reactor environment via the Li (d, n) nuclear stripping reaction. Deposition of the high-energy deuteron beam and the subsequent response of the lithium jet are modeled and evaluated in detail. To assess the feasibility of this concept, the analysis is done parametrically for various deuteron beam energies, beam currents, and jet velocities. A main requirement for a successful operation is to keep the free jet surface at a minimum temperature to reduce surface evaporation of lithium into the vacuum system. The effects of neutron-generated heating and irradiation on the jet-supporting back plate are also evaluated. The back plate must maintain a reasonable lifetime during system operation. DOE

TIME-RESOLVED INFRARED ABSORPTION STUDIES APPLIED TO THE STUDY OF RADICAL PLUS MOLECULE REACTIONS
G. A. Bethardy, R. G. Macdonald, and F. J. Northrup 1994 8 p Presented at the OE/LASE 1994: Conference on Optics, Electro-Optics, and Laser Applications in Science and Engineering, Los Angeles, CA, 22-29 Jan. 1994
(Contract W-31-109-eng-38)
(DE94-005921; ANL/CHM/CP-81658; CONF-940142-10) Avail: CASI HC A02/MF A01

Reaction of the cyano radical (CN) with ethane (C2H6) was studied using time resolved infrared absorption to monitor the product hydrogen cyanide (HCN) in individual ro-vibrational states. Pulse laser photolysis was used to provide an initial excess of the CN radical and the time dependence of individual ro-vibrational states of the high frequency anti-symmetric stretching mode of HCN (0,0,v3) was followed. These experiments reveal that the initial product state distribution of HCN is not highly excited in the HCN(0,0,v3) vibrational manifold. DOE

A description of the electromagnetic behavior of a satellite subjected to an electric discharge is given using a specially developed numerical code. One of the particularities of vacuum discharges, obtained by irradiation of polymers, is the intense emission of electrons into the spacecraft environment. Electromagnetic radiation, associated with the trajectories of the particles around the spacecraft, is considered as the main source of the interference observed. In the absence of accurate orbital data and realistic ground tests, the assessment of these effects requires numerical simulation of the interaction between this electron source and the spacecraft. This is done by the GEODE particle code which is applied to characteristic configurations in order to estimate the spacecraft response to a discharge, which is simulated from a vacuum discharge model designed in laboratory. The spacecraft response to a current injection is simulated by the ALICE numerical three dimensional code. The comparison between discharge and injection effects, from the results given by the two codes, illustrates the representativity of electromagnetic susceptibility tests and the main parameters for their definition. When two different substances are joined, material flows across the interface (sometimes imperceptibly almost) until the chemical potentials of the component species are equalized. When the substances are solid or liquid and some of the chemical species are charged, then the interface develops a net electrical polarization due to the formation of an electric double layer. The main goal of this program of study is to give a molecular basis for understanding the structure and dynamics of electrical double layers at charged metal-aqueous electrolyte interface. The aim is to unify current separate descriptions of surface adsorption and solution behavior and, ultimately, to include a detailed treatment of the surface crystallography and electronic properties of the metal. EMISSION FROM FERROELECTRIC CATHODES
S. E. Sampayan, G. J. Caporaso, C. L. Holmes, E. J. Lauer, D. Prosnitz, D. O. Trimble, and G. A. Westenskow May 1993 50 p Presented at the Workshop on High Intensity Electron Sources, Legnaro, Italy, 24-28 May 1993
(Contract W-7405-eng-48)
(DE94-006732; UCRL-JC-112646-Rev-1; CONF-9305155-3-Rev-1) Avail: CASI HC A03/MF A01

The authors have recently initiated an investigation of electron emission from ferroelectric cathodes. The experimental apparatus consisted of an electron diode and a 250 kV, 12 ohm, 70 ns pulsed high voltage power source. A planar triode modulator driven by a synthesized waveform generator initiates the polarization inversion and allows inversion pulse tailoring. The pulsed high voltage power source is capable of delivering two high voltage pulses within 50 (mu)s of each other and is capable of operating at a sustained repetition rate of 5 Hz. The initial measurements indicate that emission current densities above the Child-Langmuir Space Charge Limit, J(sub CL), are possible. They explain this effect to be based

on a non-zero initial energy of the emitted electrons. They also determined that this effect is strongly coupled to relative timing between the inversion pulse and application of the main anode-cathode pulse. They also have initiated brightness measurements of the emitted beam and estimate a preliminary lower bound to be on the order of 10(exp 9) A/sq m-rad(exp 2) for currents close to J(sub CL) and factor of two less at currents over 4J(sub CL). As in previous measurements at this laboratory, they performed the measurement using a pepper pot technique. Beamlet profiles are recorded with a fast phosphor and gated cameras. They describe their apparatus and preliminary measurements. DOE

ANALYSIS OF THE HIGH ENERGY BEHAVIOR OF THE FORWARD SCATTERING PARAMETERS - SIGMA(tot), RHO AND B
M. M. Block (Northwestern Univ., Evanston, IL), F. Halzen (Wisconsin Univ., Madison.), B. Margolis (McGill Univ., Montreal, Quebec.), and A. R. White 1993 28 p Presented at the 23rd International Symposium on Multiparticle Dynamics, Aspen, CO, 13-17 Sep. 1993
(Contracts W-31-109-eng-38; DE-AC02-76ER-02289; DE-AC02-76ER-00881)
(DE94-006537; ANL-HEP-CP-94-9; CONF-9309297-4) Avail: CASI HC A03/MF A01

Recent experimental results, namely, the remeasurement of the rho value by UA4/2 at (radical)s = 546 GeV, together with a new analysis by the E710 group of sigma(sub tot), rho and B at (radical)s = 1800 GeV, as well as their measurement of sigma(sub tot) and B at (radical)s = 1020 GeV, have provided important anchor points for the high energy behavior of (anti p)p scattering. The authors analyze high energy (anti p)p and pp data, using two distinct (and dissimilar) analysis techniques: (1) asymptotic amplitude analysis, under the assumption that they have reached 'asymptopia', and (2) an eikonal model whose amplitudes are designed to mimic real QCD amplitudes. The former gives strong evidence for a log (s/s(sub 0)) dependence at current energies and not log(sup 2)(s/s(sub 0)), and demonstrates that odderons are not necessary to explain the experimental data. The latter gives a unitary model for extrapolation into true 'asymptopia' from current energies, allowing them to predict the values of the total cross section at future supercolliders. Using their QCD-model, the authors obtain sigma(sub tot)(16 TeV)= 106 (+/-) 4 mb and sigma(sub tot)(40 TeV) = 120 (+/-) 5 mb. DOE

In our previous studies of the reactions of the methyl radical with molecular oxygen, we noticed that after the methyl radical has been consumed the reactions which control the concentration of hydroxyl are hydroxyl-hydroxyl recombination, the titled reaction, and the reaction between hydroxyl and formaldehyde. From the long-time temporal behavior of hydroxyl we have been able to extract the rate coefficient for the titled reaction over the temperature range 1580 to 2250 K. When we combine our data with the low temperature data of Klemm et al, we obtain the rate expression k(T) = 2.59 x 10(exp -16) T(exp 1.67) exp(-891/T(K)) cu cm/s(exp -1). This result is consistent with the earlier recommendation of Herron which is based on a Bond-Energy-Band-Order calculation adjusted to agree with the experimental results at 700 K. DOE

TRANSPORT PROPERTIES OF QUARK AND GLUON PLASMAS
H. Heiselberg 1 Dec. 1993 13 p Presented at the Pre-equilibrium Parton Dynamics, Berkeley, CA, 23 Aug. - 3 Sep. 1993
(Contract DE-AC03-76SF-00098)
(DE94-007043; LBL-34911; CONF-9308181-2) Avail: CASI HC A03/MF A01

The kinetic properties of relativistic quark-gluon and electron-photon plasmas are described in the weak coupling limit. The troublesome Rutherford divergence at small scattering angles is screened by Debye screening for the longitudinal or electric part of the interactions. The transverse or magnetic part of the interactions is effectively screened by Landau damping of the virtual photons and gluons transferred in the QED and QCD interactions respectively. Including screening a number of transport coefficients for QCD and QED plasmas can be calculated to leading order in the interaction strength, including rates of momentum and thermal relaxation, electrical conductivity, viscosities, flavor and spin diffusion of both high temperature and degenerate plasmas. Damping of quarks and gluons as well as color diffusion in quark-gluon plasmas is, however, shown not to be sufficiently screened and the rates depends on an infrared cut-off of order the 'magnetic mass,' m(sub mag) approximately g(sup 2)T. HYPERON POLARIZATION AND MAGNETIC MOMENTS
J. Lach Dec. 1993 24 p Presented at the 3rd Workshop on Relativistic Aspects of Nuclear Physics, Rio de Janeiro, Brazil, 25-27 Aug. 1993
(Contract DE-AC02-76CH-03000)
(DE94-006041; FNAL/C-93/381; CONF-9308210-1) Avail: CASI HC A03/MF A01

Inclusively produced hyperons with significant polarization were first observed at Fermilab about seventeen years ago. This and subsequent experiments showed that Lambda(degree) were produced polarized while bar-Lambda(degree) had no polarization in the same kinematical region. This set the stage for many experiments which showed that most hyperons are produced polarized. Recent Fermilab experiments have showed that this phenomena is even more complex and theoretical understanding is still lacking. Nevertheless polarized hyperon beams have been an extremely useful experimental tool in measuring hyperon magnetic moments. Recently, magnetic moment precession of channeled particles in bent crystals has been observed. This opens the possibility of measuring the magnetic moments of charmed baryons. DOE

EXPERIMENTAL INVESTIGATION OF PHONON EIGENVECTORS USING X RAY INTERFERENCE FIELDS Ph.D. Thesis [EXPERIMENTELLE UNTERSUCHUNG VON PHONONEIGENVEKTOREN MIT ROENTGENINTERFERENZFELDERN]
Alexis N. Zounek 1991 122 p In GERMAN Sponsored by BMFT
(ETN-94-95751) Avail: CASI HC A06/MF A02

The Thermally Diffuse Scattering (TDS) of x-ray interference fields in GaAs was measured, and the data were analyzed together with those of existing measurements on Si, with a view to the investigation of phonon eigenvectors. The contribution of multiphonon processes was taken into account using a specially developed lattice dynamics model. A method was established to separate the contributions of TDS and Compton scattering. For GaAs as well as for Si, eigenvectors were directly determined by adapting the single-phonon scattering. ESA

ENERGY AND ANGULAR DISTRIBUTIONS OF SECONDARY IONS DURING ELECTRONIC SPUTTERING OF NONCONDUCTING SURFACES Ph.D. Thesis [ENERGIE- UND WINKELVERTEILUNGEN VON SEKUNDAERIONEN BEIM ELEKTRONISCHEN SPUTTERN VON NICHTLEITER-OBERFLAECHEN]
Robert Moshammer 1991 87 p In GERMAN
(ETN-94-95756) Avail: CASI HC A05/MF A01

Energy and angular distributions of desorbed particles were measured during irradiation of nonconducting solid substances with heavy ions to get additional information about sputtering in the range of electronic energy loss. The developed system allows a significantly more accurate measurement of the secondary ion energy distribution than previously as well as for the first time an angular distribution. The projectile incidence angle is shown to be an important parameter for the angular distribution of organic molecular ions. No directed emission is found for secondary ions from inorganic substances, even for those with large mass. Positive ions are emitted with higher energy than negative ions with comparable mass. Comparison of the experimental results with models shows that fragile organic molecular ions are removed from the surface by the shock wave. The emission of lighter fragment ions is compatible with the approach of an outflowing gas. ESA

THE MEASUREMENT OF THE HADRONIC ENERGY FLOW AND JET PRODUCTION WITH THE ZEUS CALORIMETER IN DEEP INELASTIC SCATTERING EVENTS AT HERA Ph.D. Thesis
Paulus Johannes deJong 1993 204 p Sponsored by Stichting voor Fundamenteel Onderzoek der Materie
(ETN-94-96021) Avail: CASI HC A10/MF A03

A study which shows that the hadronic energy flow (resulting from the struck proton) in deep inelastic scattering events can be measured with a high resolution calorimeter, used to distinguish between a number of these models, test the predictions of various structure function parametrizations in the new kinematical region, and find evidence for the occurrence of higher order processes involving gluons in deep inelastic scattering, is presented. The kinematics and physics at the HERA collider and the ZEUS detector are described. The emphasis is on the role of calorimetry. Hardware and offline software for measurements are described. Monte Carlo generator programs, and the fragmentation and quantum chromodynamics model they implement, are described. Application to ZEUS data is described. Various distributions of the reconstructed kinematics and the hadronic energy flow are presented and compared to Monte Carlo data. A cone jet finding algorithm is applied to the data. ESA

N94-31537# Vrije Univ., Amsterdam (Netherlands).
INFLUENCE OF LONG-RANGE CORRELATIONS ON THE SPECTRAL FUNCTIONS AND RESPONSE OF 48Ca AND 90Zr Ph.D. Thesis
Guestl Adonis Rijsdijk 1993 109 p
(ETN-94-96017) Avail: CASI HC A06/MF A02

The calculation of single particle strength distributions or spectral functions is addressed. An additional aim is the study of the influence of single particle strength fragmentation on the nuclear response. Proton-hole spectral functions are calculated by solving the Dyson equation for the one-body Green function. The calculations are performed for the nuclei Ca-48 and Zr-90 using a parameterized form of the G-matrix of the Bonn meson exchange potential as an effective interaction. Response functions are calculated taking into account the fragmentation of the single particle strength explicitly. ESA

COLLECTIVE AND QUASIPARTICLE EXCITATIONS IN LIGHT Pb ISOTOPES Ph.D. Thesis
Adrianus Johannes Ma Plompen 1993 124 p
(ETN-94-96014) Avail: CASI HC A06/MF A02

The structure at high spin of the light Pb isotopes Pb-192 and Pb-196 was investigated by studying the gamma decay of these nuclei. The aim was to establish the rotational bands that were expected to be based on the known intruder configurations. However, in a brief study of the nucleus Pb-196, the previous indications for such a band based on the O(+) intruder state appeared to be elusive, and the structure based on the 11(-) intruder state turned out to be quite different from what was expected. It was realized only after the full fledged study of Pb-192 that the excitation energy pattern of the levels that decay via the 11(-) intruder state is probably a rather general feature. In particular, neutron intruder excitations in addition to the proton excitations are needed to achieve stable rotating configurations, which therefore occur at higher excitation energy and spin. ESA

N94-31549# Vrije Univ., Amsterdam (Netherlands).
DIAMAGNETISM IN HELIUM RYDBERG ATOMS Ph.D. Thesis
Tonny vanderVeldt 1993 122 p
(ETN-94-96015) Avail: CASI HC A06/MF A02

Experiments on highly excited helium Rydberg atoms in magnetic fields are addressed. Theories of the hydrogen and helium Rydberg atom in a magnetic and an electric field are summarized. For experiments in magnetic fields, a magnet, an excitation chamber to screen the interaction region for stray electric fields, and an enhancement cavity to increase the intensity of UV laserlight for the excitation process, were built. The following investigations are reported: the helium atom in a pure magnetic field in the low field regime, where well resolved angular momentum manifolds are recorded; the helium Rydberg atom in parallel electric and magnetic fields; and the quasi-Landau structure of helium Rydberg states using scaled energy spectroscopy. ESA

IONIZING RADIATION EFFECTS ON SILICON TEST STRUCTURES
H. W. Kraner, R. Beuttenmuller, W. Chen, J. A. Kierstead, Z. Li, Y. Zhang, L. Dou, E. Fretwurst, and G. Lindstroem Dec. 1993 18 p Presented at the 1st International Conference on Large Scale Applications and Radiation Hardness of Semiconductor Detectors, Florence, Italy, 7-9 Jul. 1993
(Contract DE-AC02-76CH-00016)
(DE94-006060; BNL-49823; CONF-9307163-1) Avail: CASI HC A03/MF A01

The effects of Co-60 gamma irradiation on MOSCAPS and special junction diode detectors have been studied. The capacitors were used to elicit the charge accumulation and anneal in two types of thermally grown oxides representative of those used in routine detector processing. Ion

implanted, oxide passivated junction detectors having 0.25 and 1 cm(exp 2) areas and perimeter to area ratios of 1 (a square), 2 and 5 were designed and constructed to amplify the ionizing effects expected to largely affect junction edges through changes in fixed oxide charges. Detectors were exposed to over 4 Mrad and showed clear increases in leakage current in proportion to the junction edge length. Annealing schedules were determined to provide a continuous response to incremental irradiations and subsequent room temperature anneals of leakage current. Besides an increase in gate threshold, little effect on the C(V) response was found. PISCES simulation of the edge fields using different fixed oxide charge revealed regions of very high lateral fields near the junction edges for fixed charges in the 2 x 10(exp 12)/cm(exp 2) range expected from the capacitor studies which could be responsible for the observed leakage currents. DOE

OPTIMAL DETECTOR STRATEGIES FOR THE PHASE CONTRAST IMAGING FOR SCANNING TRANSMISSION ELECTRON MICROSCOPES Ph.D. Thesis [OPTIMALE DETEKTORSTRATEGIEN FUER DIE PHASENKONTRASTABBILDUNG IM RASTER-TRANSMISSIONS-ELEKTRONENMIKROSKOP]

Michael Hammel 1992 130 p In GERMAN Sponsored by DFG
(ETN-94-95747) Avail: CASI HC A07/MF A02

The applicability of the principle of multiple signal imaging for the Scanning Transmission Electron Microscope (STEM) is addressed. The study was limited to the bright field imaging of objects whose structure can be modeled in a simple way. Imaging theory, and the concept of transfer function and its relation to the signal to noise ratio are explained. Experimental investigations demonstrate that a phase contrast procedure can be quantified for the conventional method of signal acquisition using a nonsegmented circular detector. The different detector strategies are outlined. Statements about the optimal detector configuration are given, nearly independently of the object. ESA

CONTROL HEAVY ION COLLISIONS IN THE SYSTEMS Ar-40 + Ca-40 AND Si-28 + Si-28, AND THE NATURE OF PARTICLE EMISSION IN FUSION-EVAPORATION REACTIONS Ph.D. Thesis [ZENTRALE SCHWERIONENSTOESSE IN DEN SYSTEMEN 40AR + 40CA UND 28SI + 28SI UND DIE NATUR DER TEILCHENEMISSION IN FUSION-VERDAMPFUNGS-REAKTIONEN]

Andreas Oberstedt 1991 111 p In GERMAN
(Contract BMFT-06-DA-184-I)
(ETN-94-95749) Avail: CASI HC A06/MF A02

The system Ar-40 + Ca-40 was investigated at 15 MeV/h in the heavy ion accelerator UNILAL to study the influence of the incident energy on pre-equilibrium effects. Neutrons were detected in coincidence with evaporation rest nuclei, whose mass distribution was measured by a special time of flight spectrometer and explained by the emission of light particles using a statistical model. The isotropic equilibrium contribution was separated from the angle dependent pre-equilibrium contribution using the energy spectra and the angular distribution of the neutrons. The dependence of the particle emission in central collisions of the system Si-28 + Si-28 was investigated in the accelerator VICKSI. Mass and charge numbers of the evaporation test nuclei were determined. A statistical model shows that emission is due to light particles. The results provide information pertaining to the equation of state of the nuclear matter. ESA

DOUBLE ROTATION NMR STUDIES OF ZEOLITES AND ALUMINOPHOSPHATE MOLECULAR SIEVES Ph.D. Thesis

R. Jelinek Jul. 1993 202 p
(Contract DE-AC03-76SF-00098)
(DE94-007032; LBL-34881) Avail: CASI HC A10/MF A03

The goal is to study the organization and structures of guest atoms and molecules and their reactions on internal surfaces within pores of zeolites and aluminophosphate molecular sieves. Al-27 and Na-23 double rotation NMR (DOR) is used since it removes the anisotropic broadening in NMR spectra of quadrupolar nuclei, thus increasing resolution. This work concentrates on probing aluminum framework atoms in aluminophosphate molecular sieves and sodium extraframework cations in porous aluminosilicates. In aluminophosphates, ordering and electronic environments of the framework Al-27 nuclei are modified upon adsorption of water molecules within the channels; a relation is sought between the sieve channel topology and the organization of adsorbed water, as well as the interaction between the Al nuclei and the water molecules. Extraframework Na(sup +) cations are directly involved in adsorption processes and reactions in zeolite cavities. DOE

STUDY OF ASSOCIATED GAUGE BOSON PRODUCTION AT D0: W GAMMA PRODUCTION

A. L. Spadafora (Superconducting Super Collider Lab., Dallas, TX.) Jan. 1994 12 p Presented at the 9th Workshop on Proton-Antiproton Collider Physics, Tsukuba, Japan, 18-22 Oct. 1993
(Contract DE-AC02-76CH-03000)
(DE94-006951; FNAL/C-94/016-E; CONF-9310247-14) Avail: CASI HC A03/MF A01

Preliminary results are presented from a study of (bar p)p yields W gamma + X at square root of s = 1800 GeV at D0 using data from its recently completed first run at the Fermilab Tevatron Collider. The analysis is performed in both the electron and muon channels. In each channel 10

events are observed, which, after subtracting backgrounds, agrees with the standard model expectation. Study of this process is a direct test of the couplings of the WW gamma vertex. Using a Monte Carlo calculation of the dependence of the number of expected events on these couplings, we set preliminary limits (at the 95 percent confidence level) on the anomalous couplings of -2.5 less than or equal to Delta kappa less than or equal to 2.7 (lambda = 0) and -1.2 less than or equal to lambda less than or equal to 1.1 (Delta kappa = 0). DOE

PRACTICAL NEUTRON TRAINING COURSE: COURSE NOTES
S. M. Bennington, A. C. Hannon, and J. B. Forsyth Dec. 1993 39 p See also DE85-702837 and PB92-200187
(PB94-145158; RAL-93-083) Avail: Issuing Activity (National Technical Information Service (NTIS))

The aim of this course is to provide students who are just starting work in neutron scattering with practical experience of running neutron scattering experiments. The course is constructed so as to provide an introduction to the practicalities of running neutron scattering experiments, especially those performed on a pulsed neutron source. It is intended to be similar in structure to a university undergraduate course, and it is divided into a series of experiments which explore various aspects of neutron scattering. The course is not meant to be a complete self-contained introduction to neutron scattering as this would take considerably longer than one week, but it attempts to provide foundations and to introduce ideas that will be built upon in subsequent practical work. Chapter headings include the following: detector set up, transmission-related properties of materials, diffraction, single crystal neutron diffraction, beryllium filter spectrometer, and the crystal analyzer spectrometer. Appendices include: GENIE basics, useful conversion factors, description of the test beamline, checklist on how to perform a run, d-spacings and selection rules for simple crystal systems, and crystal structures of some metallic elements. MECHANISMS OF FORMATION AND OF DE-EXCITATION IN THE REACTION Mg-24 + C-12 YIELDS 9 ALPHA AT 35MeV PER NUCLEON M.S. Thesis [MECANISMES DE FORMATION ET DE DESEXCITATION DANS LA REACTION MG-24 + C-12 YIELDS 9 ALPHA A 35 MEV PAR NUCLEON]
Yves Larochelle Jul. 1993 131 p In FRENCH
(ISBN-0-315-86746-9; CTN-94-61226) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Experiments were conducted at the Chalk River Laboratories on the mechanisms of formation of highly excited nuclei and their de-excitation following a collision between heavy ions at intermediate energies. Investigation of the reactions utilized a matrix of 80 detectors mounted in five concentric rings. The detectors in the three inner rings are of the phoswich type and the 32 detectors in the other two rings are the CsI(Tl) type. Implementation of the technique of secondary beams originating from a superconducting cyclotron beam enabled establishment of a new parametrization of the response of CsI as a function of the energy, charge, and mass of the particles. Results are presented related to the complete breakup of the system into nine alpha particles. This output path presents the advantage of containing the total charge of the system and also of eliminating the ambiguity of isotopic identification. In particular, the angular distributions and the correlation functions obtained are compared to different theoretical models. CISTI

SPECTROSCOPIC STUDY OF THE MOLECULAR COLLISIONS (HYDROGEN-NITROGEN AND HYDROGEN-OXYGEN) AT ENERGIES OF SEVERAL MeV M.S. Thesis [ETUDE SPECTROSCOPIQUE DES COLLISIONS MOLECULAIRES (HYDROGENE-AZOTE ET HYDROGENE-OXYGENE) A DES ENERGIES DE QUELQUES MEV]
Jacinthe Plante Jan. 1993 153 p In FRENCH
(ISBN-0-315-86794-9; CTN-94-61230) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Results are presented from a systematic study concerning the constant velocity collisions between hydrogen projectiles (H(+), H2(+), and H3(+) at 1 MeV/nucleon) and two gases (O2 and N2). These collisions are of interest for atmospheric studies, in particular for protonic auroras. Emission spectra in the ultraviolet and visible (1200 to 6000 Angstroms) were recorded as a function of type of projectile in order to study the role of accompanying electrons in the various collisional processes, and as a function of the target gas pressure in order to determine the relative importance of single and multiple collisions in this process. The observations confirm the formation of the neutral nitrogen atom, resolving a question which was posed in recent work. These observations suggest the absence of most of the atomic and molecular hydrogen lines. It is the same for the first vibrational levels of the C 2-Sigma(sub u(+)) - X 2-Sigma(sub g (+)) bands of N2(+), even if the latter have already been excited by electron impact to energies comparable to those of the electrons which accompany the H2(+) and H3(+) projectiles in the study. PERTURBATIVE AND NONPERTURBATIVE EM LEPTON PAIR PRODUCTION IN RELATIVISTIC HEAVY-ION COLLISIONS
V. E. Oberacker, J. C. Wells, A. S. Umar, and M. R. Strayer 1993 11 p Presented at the NATO Advanced Study Institute on Hot and Dense Nuclear Matter, Bodrum, Turkey, 26 Sep. - 9 Oct. 1993
(Contract DE-AC05-84OR-21400)
(DE94-006315; CONF-930999-6) Avail: CASI HC A03/MF A01

In this talk, the authors focus on electromagnetic dilepton production from the QED-vacuum in relativistic heavy-ion collisions. Heavy ions in relativistic motion generate strong time-dependent EM fields with large Fourier components which give rise to sizable pair production. There are several motivations for this study: Lepton pair production by hadronic (Drell-Yan) processes has been widely discussed as a possible signature of the quark-gluon plasma formation. The dominant background will come from electromagnetic sources and could even mask the signals from the plasma phase. Electromagnetically produced lepton pairs also impose severe constraints on the design of relativistic heavy-ion colliders such as RHIC and LHC. In addition to the free pair production discussed above, pair-production with capture of the negatively charged lepton into a bound state is also possible. This change of the charge state of the ions is the leading mechanism for beam loss of relativistic colliders. Accurate predictions of the cross section for this process are important because the cross section increases with energy. DOE

All left-right supersymmetry models contain a second Z(0) boson, Z'. If the Z' is massive enough it will decay into charginos and neutralinos. The particular model considered is an extension of the supersymmetric standard model which has been modified to include both left and right symmetry groups. The cross sections have been calculated for the production of

charginos and neutralinos in the reaction in which a positron electron pair decays into a Z' boson which then yields pairs of charginos or neutralinos. The Z'-reaction was evaluated at the center of mass energy up to 2 TeV for different sets of parameters. Since the chargino and neutralino masses were chosen in the range above 50 GeV, their widths are expected to be on the order of a fraction of a GeV. Unless the charginos or neutralinos in question turn out to be stable, the decay of these particles should occur well within a detector. Within such widths, experiments should be able to observe not the charginos and neutralinos themselves, but their decay products. The expected decay products are listed. Author (CISTI)

PRODUCTION AND DETECTION OF METASTABLE ATOMIC OXYGEN Ph.D. Thesis
Lance Richard Leclair Jun. 1993 172 p
(ISBN-0-315-87364-7; CTN-94-61223) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The metastable species O(1S) has been observed following the dissociation of O2, N2O, and CO2 molecules by pulsed electron impact. A crossed beam apparatus was used to obtain time-of-flight spectra of the fragments. A novel detector consisting of a layer of freshly deposited Xe was employed. O(1S) atoms impinging on the surface quickly form XeO excimers which rapidly decay, producing easily detected photons. In the case of O2 and N2O, present results indicate that this method is sensitive solely to O(1S) with high quantum efficiency. In the case of CO2, the Xe layer is sensitive to O(1S) and the metastable CO(a3Pi). Low resolution optical spectra of the emissions which follow the arrival of O(1S) at the Xe layer reveal bands at 375, 550, and 725 nm, while CO(a3Pi) fragments impinging on the layer produce emissions below 350 nm. Time-of-flight and released kinetic energy spectra for all target gases are presented along with excitation functions from threshold to 1,000 eV. These were made using a Bethe-Born calibration technique. Maximum cross sections for O(1S) production were also determined. Author (CISTI)

BARYOGENESIS FROM A PRIMORDIAL LEPTON ASYMMETRY
S. A. Abel and K. E. C. Benson 21 Dec. 1993 29 p Prepared in cooperation with Oxford Univ., Englan d
(PB94-145166; RAL-93-103) Avail: Issuing Activity (National Technical Information Service (NTIS))

We examine the generation of baryon asymmetry at the weak scale from a primordial lepton asymmetry. If the electroweak phase transition is first order, partial reflection of tau leptons off the bubble walls and the resulting hypercharge transport into the symmetric phase, gives rise to a baryon number consistent with observation. (PB94-147055; RAL-93-074) Avail: Issuing Activity (National Technical Information Service (NTIS))

The possibility of discovering heavy Majorana neutrinos and lepton number violation via the like sign dilepton signal at hadron supercolliders is investigated. The cross-sections for the production of these neutrinos singly as well as in pairs are computed both in three and four generation scenarios within the framework of the gauge group SU(2)(sub L) X(circled) U(1)(sub Y) and the dominant processes are identified. The suppression of the Standard model background by suitable kinematical cuts is also discussed. NTIS

A MODEL OF THE ION CHEMISTRY OF ELECTRIFIED CONVECTION Ph.D. Thesis
Robert A. Boldi 1992
Avail: Issuing Activity (MIT Libraries, Rm. 14-0551, Cambridge, MA 02139-4307)

To examine the chemical effects of the reactions induced by the ions, electrons, and photons produced in and around a lightning channel, a two-dimensional, axisymmetric dynamical/chemical model of electrified convection has been developed. This model considers approximately 800 thermal and photochemical reactions among 165 neutrals, ions, water clusters, and electrons; effects of pressure, temperature, and electric fields upon the reaction coefficients are explicitly considered. Because the aim of this thesis to focus on ion production and their subsequent gas-phase reactions, aqueous-phase chemistry has not been considered (although heterogeneous loss is represented) and the dynamics and microphysics are specified in a relatively simple manner. The ion and UV-photon generation mechanisms dominate the overall production of many neutrals such as atomic O, N, and H, and are responsible for elevated mixing ratios of the sparingly soluble or short lived chemical families that derive from these species (i.e. NO(x), O(x)). In general, the ion and UV-induced reactions contribute equally to the production of both O((sup 3)P) and O ((sup1)D) and consequently are equally important in the overall chemistry of O3 and OH and other derivative chemical species. The Electrified model represents a net-loss process for some chemical species, primarily due to enhanced in-cloud OH levels. On a global basis this model accounts for the annual destruction of 1.8 Tg of CO, 0.45 Tg of CH4, and 2 x 10(exp -4) Tg of OCS. Once again, these are small fractions of the currently estimated annual source strengths of these species (1600 Tg CO, 525 Tg CH4, and 0.4 Tg OCS). This model is now being refined to include (1) a better representation of heterogeneous loss to the ice phase and (2) feedback between space charge (ions) and the electric field and it is being expanded to include the full range of aqueous-phase chemistry. Additionally (1) a better understanding of the electric-field-strength dependent reactions of e(sup -) and O2 with water would be valuable in quantifying the production of the HO(sub y) family and (2) modeling the production of corona from water would improve the simulation of aqueous-phase ion chemistry. Dissert. Abstr.

RESULTS FROM THE H1 EXPERIMENT AT HERA
J. Dainton Jan. 1994 29 p See also DE93-766345
(PB94-145174; RAL-94-012) Avail: Issuing Activity (National Technical Information Service (NTIS))

First results from the H1 experiment at the high energy electron-proton (ep) collider HERA are presented. Based on an integrated ep luminosity of about 25 nb(sup -1) accumulated during the first data taking period in 1992, first measurements of soft and hard photoproduction and of deep inelastic ep scattering (DIS) have been made. The total photoproduction cross section is measured to be 156 +/- 2 +/- 18 (sys) (mu)b at less than W(sub (gamma)p) greater or equal to 197 GeV. Hard partonic dynamics in photoproduction are observed, and resolved photon contributions inferred in which first hints of interactions involving gluonic components of real photon structure are seen. A measurement of the proton structure function F(sub 2)(x,Q(sub 2)) in the new kinematic region of Bjorken x (x(sub Bj)) between about 10(sup -4) and about 10(sup -2) is presented showing a substantial rise as (x(sub Bj)) decreases. Measurements of the characteristics of hadronic energy flow in such low x DIS events are presented, and a class of events with a large pseudorapidity interval devoid of hadronic energy close to the proton beam direction is reported. X RAY PULSE CONSIDERATIONS AND ELECTRON FLOW IN HIGH VOLTAGE DIODES M.S. Thesis
Michael O. Callahan Dec. 1993 78 p
(AD-A277301) Avail: CASI HC A05/MF A01

Electrical breakdown in high voltage diodes has been studied since the 1920's, yet it is still not well understood. This study characterizes the

electron flow during breakdown in a high voltage vacuum diode. This was accomplished by measuring the x rays produced when electrons strike the anode of the diode. Current measurements taken during the experiment include both the displacement and conduction electron current, so the x-ray signal is the best measure of the conduction current. Knowledge of the electron flow is important in determining the mechanism of breakdown. The currently accepted explosive electron emission (EEE) model for electrical breakdown can not properly account for the energy required to form cathode spots. Schwirzke proposed a new model that involves an ionization process and a subsequent unipolar arc that accounts for the energy to form the spots. Electron flow for the two models is very different. The EEE model requires a large current density for several nanoseconds before plasma formation, whereas the new model predicts a large current density that develops simultaneously with the plasma formation. The results of this experiment support the predictions of the new model. DTIC

POSITRON-MOLECULE INTERACTIONS Final Technical Report, 1 Oct. 1989 - 31 Dec. 1993
Clifford M. Surko 14 Feb. 1994 9 p
(Contract N00014-89-J-1769)
(AD-A276542; TR-3-ONR) Avail: CASI HC A02/MF A01

The objective of this research was to study the interaction of positrons with molecules at energies below the threshold for positronium atom formation. While there is evidence that positrons bind or form long-lived resonances with large atoms and molecules, this phenomenon is not understood. This phenomenon has a number of potentially important scientific and technological applications, including aspects of atomic and molecular physics, the formation of positive ions for mass spectrometry, and gamma ray astronomy. Many facets of the interaction of low energy positrons with molecules were illuminated, including the scaling of positron annihilation rate with molecular ionization potential and the identification of other trends as a function of chemical structure. Spectra of the gamma ray radiation resulting when a positron annihilates on a molecule were also measured. The measurements indicate that the site of positron binding is on the C-H bond in hydrocarbon molecules and on the fluorine atoms in fluorine compounds. The measured annihilation rates on large aromatics indicate that these molecules are likely to be an important source of the annihilation radiation observed from the interstellar medium. DTIC

A GENERAL STOCHASTIC LIOUVILLE THEORY FOR SEQUENTIAL AND SUPEREXCHANGE ELECTRON-TRANSFER REACTIONS INVOLVING THREE MARCUS POTENTIAL SURFACES
J. Tang 1994 26 p
(Contract W-31-109-eng-38)
(DE94-007695; ANL/CHM/PP-80246) Avail: CASI HC A03/MF A01

A general theory for nonadiabatic electron-transfer reactions at high temperature involving Marcus parabolic potential surfaces is presented. The theory can be applied to a three-component system with a donor, a bridging intermediate and an acceptor as well as to a system with charge separation from a photo-excited state followed by charge recombination to a third or ground state. Using the nonperturbative stochastic Liouville approach, analytical expressions are derived for the superexchange and the sequential electron-transfer rate constants covering all three conditions: the 'nondegenerate,' the 'degenerate' and the 'quasi-degenerate' regimes. CHARGE-DEPENDENT ATOMIC-SCALE STRUCTURES OF HIGH-INDEX AND (110) GOLD ELECTRODE SURFACES AS REVEALED BY SCANNING TUNNELING MICROSCOPY
Xiaoping Gao, Gregory J. Edens, Antoinette Hamelin, and Michael J. Weaver Feb. 1994 48 p
(Contract N00014-91-J-1409)
(AD-A276782; TR-149) Avail: CASI HC A03/MF A01

The atomic and nanoscale structures of high-index gold surfaces in aqueous perchloric acid electrolyte as revealed by in-situ scanning tunneling microscopy (STM) under electrode potential control are reported with the objective of ascertaining systematically the terrace-step morphology and superstructures as a function of the crystallographic orientation. Six faces, Au(221), (331), (533), (311), (210), and (410), two each lying in the three fcc crystallographic zones, were selected to investigate the role of the step orientation and terrace width for non-vicinal faces. Data for the low-index surface Au(110) are also included for comparison with Au(331) and (221), since all three feature formally a n(111)-(111) terrace-step structure. Measurements of the double-layer capacitance as a function of the electrode potential, E, in dilute (10 mM) perchloric acid were also undertaken in order to evaluate the potential of zero charge (E sub pzc) for each surface and to check the potential-dependent surface stability. The two surfaces in the (111)-(100) zone, Au(533) and (311), both display essentially (1 x 1) (i.e bulk-termination) atomic structures at positive electrode charges (i.e. for E greater than E sub pzc), yet exhibit significant surface relaxation at negative charges involving edge-atom depression and row buckling. For the surfaces in the (111)-(110) zone, Au(221) and (331), however, such surface relaxation is seen even at positive electrode charges. This behavioral difference can be understood on the basis of the differing step structures present in the two zones. Moreover, Au(331) undergoes a reversible (1 x 2) reconstruction at negative charges, involving row pairing. DTIC

MEDIUM ENERGY MEASUREMENTS OF N-N PARAMETERS
D. Ambrose, M. Bachman, P. Coffey, G. Glass, B. Jobst, K. H. McNaughton, C. Nguyen, and P. J. Riley 1 Oct. 1993 84 p
(Contract DE-FG05-88ER-40446)
(DE94-006067; DOE/ER-40446/6) Avail: CASI HC A05/MF A01

The authors report here progress made during the three year period January 1, 1990, to December 31, 1993, for the Department of Energy three-year grant number DE-FG05-88ER40446, third year. A major part of the work has been associated with nucleon-nucleon (N-N) research carried out at the Nucleon Physics Laboratory (NPL) at the Los Alamos Meson Physics Facility (LAMPF). During this period they also completed data acquisition and analyses of a TRIUMF experiment, but they have no further plans for experimental work at TRIUMF. Other research has been and will be continued to be carried out at BNL, and involves two rare kaon decay experiments, BNL E791, now completed, and a second generation rare kaon decay experiment, E871, which has just this summer completed an engineering test run. The authors are now also members of a proposed experiment, STAR, (solenoidal tracker at RHIC) to be carried out at the Relativistic Heavy Ion Collider Facility, RHIC, at BNL. The past three years have been a time of rapid change in the focus of the experimental program. A LAMPF experiment, E1097, in which they spent a large amount of effort during the past three years, was terminated due to funding shortages after they had fabricated the detector, but before data acquisition, and consequently they increased their participation in the rare kaon experiment at BNL, E871. It now appears that there will be no LAMPF N-N program after 1993, so that the research efforts will concentrate on the BNL rare

kaon decay measurement, E871, and on STAR. The authors expect that STAR, which requires the fabrication of a large colliding beam detector facility, will use an increasing amount of their research efforts during the next few years. In what follows they describe recent progress on the LAMPF and TRIUMF N-N measurements, on the BNL rare kaon decay work, and on the initial work with the STAR group. DOE

Atomic and molecular processes in plasmas play a crucial role in the development of net energy producing magnetic fusion devices. In light of this fact, presented here is a survey of the broad needs of fusion energy research and a review of the status of the existing database. Emphasis is placed on the relatively new needs for data as novel materials are evaluated for use in the next devices and as components such as the divertor take on more significance for demonstration and practical reactors. Also, examples are given of recent or ongoing data evaluation efforts, the role of national and international data centers is discussed, and some summarizing comments are given. DOE

ADVANCES AND APPLICATIONS OF DYNAMIC-ANGLE SPINNING NUCLEAR MAGNETIC RESONANCE Ph.D. Thesis
J. H. Baltisberger Jun. 1993 219 p
(Contract DE-AC03-76SF-00098)
(DE94-007031; LBL-34883) Avail: CASI HC A10/MF A03

This dissertation describes nuclear magnetic resonance experiments and theory which have been developed to study quadrupolar nuclei (those nuclei with spin greater than one-half) in the solid state. Primarily, the technique of dynamic-angle spinning (DAS) is extensively reviewed and expanded upon in this thesis. Specifically, the improvement in both the resolution (two-dimensional pure-absorptive phase methods and DAS angle choice) and sensitivity (pulse-sequence development), along with effective spinning speed enhancement (again through choice of DAS conditions or alternative multiple pulse schemes) of dynamic-angle spinning experiment was realized with both theory and experimental examples. The application of DAS to new types of nuclei (specifically the Rb-87 and Rb-85 nuclear spins) and materials (specifically amorphous solids) has also greatly expanded the possibilities of the use of DAS to study a larger range of materials. This dissertation is meant to demonstrate both recent advances and applications of the DAS technique, and by no means represents a comprehensive study of any particular chemical problem. DOE

ANTIPROTON PRODUCTION IN HEAVY ION COLLISIONS
B. V. Jacak 1993 13 p Presented at the NATO Advanced Study Institute on Hot and Dense Nuclear Matter, Bodrum, Turkey, 5 Oct. 1993
(Contract W-7405-eng-36)
(DE94-007552; LA-UR-94-713; CONF-9310293-1) Avail: CASI HC A03/MF A01

In high energy p-p and alpha-alpha collisions, baryons are observed predominantly at rapidities near those of target and projectile; the mean rapidity shift of projectile and target nucleons is approximately one unit. In the central rapidity region, the number of baryons is quite small. In fact, the number of baryons and antibaryons is rather similar, indicating that most of these baryons are CREATED particles rather than projectile and target fragments. Antibaryon production is of interest in heavy ion collisions as enhanced antiquark production has been predicted as a potential signature of quark-gluon plasma formation. Antibaryons also provide a sensitive probe of the hadronic environment, via annihilation and/or mean field effects upon their final distributions. However, the collision dynamics also affect the baryon and antibaryon distributions. Baryons are more shifted toward midrapidity in nucleus-nucleus and p-p nucleus collisions than in p-p collisions, increasing the probability of annihilating the antibaryons. The interpretation of antibaryon yields is further complicated by collective processes which may take place in the dense hadronic medium formed in nucleus-nucleus collisions. Jahns and coworkers have shown that multistep processes can increase antibaryon production near threshold. Antiproton production is clearly very interesting, but is sensitive to a combination of processes taking place in the collision. The final number of observed antiprotons depends on the balance between mechanisms for extra antiproton production beyond those from the individual nucleon-nucleon collisions and annihilation with surrounding baryons. We can hope to sort out these things by systematic studies, varying the system size and beam energy. I will review what is known about antiproton production at both the AGS and SPS, and look at trends going from p-p to p-nucleus to nucleus-nucleus collisions. DOE

The subject of this research is the quantization of atomic motion. Atoms can easily be cooled to kinetic energies below 0.2 MHz, which is below the light shifts in a weak standing wave. At low excitation rates, an optical standing wave may be viewed as producing a sinusoidal potential. Atoms are then confined in the lambda space between the planes of the standing wave, but have a deBroglie wavelength of approximately equal to lambda/10 or more. Thus their motion is quantized by the light field. We have evidence of this quantization of motion from direct RF spectroscopy of the vibrational states in the wells. The position of the rf peaks do not correspond to the calculated energy intervals and do not shift with laser parameters as expected. DTIC

Progress was made in three areas. First, we have made major strides in developing our PSGVB electronic structure code including high level electron correlation methods needed to treat complex structures like semiconductor clusters. Secondly, we have developed a one-electron pseudopotential model for semiconductor clusters which reproduces the experimental bandgap as a function of cluster size without adjustable parameters. We are currently using the model to calculate absorption spectra as opposed to just the bandgap via a dispersed polaron formalism. Finally, we have developed two novel quantum dynamical methods, one involving surface hopping and the second utilizing Redfield theory. These methods will be applied to calculation of the relaxation of an excited electron in a semiconductor cluster and also to electron transfer through DNA. DOE

RESEARCH PROGRAM IN PARTICLE PHYSICS
E. C. G. Sudarshan, D. A. Dicus, J. L. Ritchie, and K. Lang May 1993 55 p
(Contracts DE-FG03-93ER-40757; DE-FG05-85ER-40200)
(DE94-008449; DOE/ER-40757/322) Avail: CASI HC A04/MF A01

This report is the progress report for DOE funded support of particle physics work at the University of Texas, Austin. Support was divided between theoretical and experimental programs, and each is reviewed separately in the report. Theoretical effort was divided between three general areas: quantum gravity and mathematical physics; phenomenology; and quantum mechanics and quantum field theory. Experimental effort was primarily directed toward AGS experiments at Brookhaven, to look for rare kaon decays. AGS experiments 791 and 871 are described, along with BNL experiment 888. DOE

FORMATION MECHANISM AND YIELD OF MOLECULES EJECTED FROM ZnS, CdS, AND FeS2 DURING ION BOMBARDMENT
S. Nikzad, W. F. Calaway, M. J. Pellin, C. E. Young, D. M. Gruen, and T. A. Tombrello 1994 29 p
(Contract W-31-109-eng-38)
(DE94-008487; ANL/CHM/PP-76357) Avail: CASI HC A03/MF A01

Neutral species ejected from single crystals of ZnS, CdS, and FeS2 during ion bombardment by 3 keV Ar(sup +) were detected by laser post-ionization followed by time-of-flight mass spectrometry. While metal atoms (Fe, Zn, Cd) and S2 were the dominant species observed, substantial amounts of S, FeS, Zn2, ZnS, Cd2, and CdS were also detected. The experimental results demonstrate that molecules represent a larger fraction of the sputtered yield than was previously believed from secondary ion mass spectrometry experiments. In addition, the data suggest that the molecules are not necessarily formed from adjacent atoms in the solid and that a modified form of the recombination model could provide a mechanism for their formation. DOE

JET PHYSICS AND QCD TESTS AT THE TEVATRON COLLIDER
R. Plunkett Feb. 1994 28 p Presented at the Conference on Physics in Collision, Heidelberg, Germany, 16-18 Jun. 1993
(Contract DE-AC02-76CH-03000)
(DE94-008987; FNAL/C-94/045-E; CONF-9306251-3) Avail: CASI HC A03/MF A01

Results are presented detailing the status of tests of perturbative QCD in hard parton-parton collisions generated by high energy collisions of protons and antiprotons at the Fermilab Collider. Recent data from the CDF and DO experiments are compared to Next-to-Leading Order QCD calculations in hadronic jet production, prompt photon production, jet production in events with W bosons, and b-quark production. DOE

WAVE PACKET STUDIES OF THE VIBRATIONAL PREDISSOCIATION OF THREE AND FOUR-ATOM VAN DER WAALS COMPLEXES
S. K. Gray 1994 25 p Presented at the Royal Society of Chemistry Conference, Durham, England, 2-8 Apr. 1994 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-31-109-eng-38)
(DE94-007623; ANL/CHM/CP-81637; CONF-9404106-1) Avail: CASI HC A03

Vibrational predissociation of XI2 and X2I2 van der Waals complexes, with X = He and Ne, is studied with wave packets. Three dimensional calculations are carried out on the three-atom systems. Suitable X..I potential interactions are determined, and product distributions are predicted. Reduced dimension models of X2I2(v prime) yields 2X + I2(v less than v prime) are investigated. Comparison is made with available experimental results. Mechanistic issues, including the role of intramolecular vibrational relaxation resonances, are addressed. DOE

RATE COEFFICIENT FOR THE REACTION H + O2 YIELDS OH + O: RESULTS FROM 2000 TO 5300 K
J. P. Hessler and Hong Du 1994 9 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-31-109-eng-38)
(DE94-008105; ANL/CHM/PP-75156) Avail: CASI HC A02

Tunable-laser flash absorption has recently provided an unprecedented extension of the temperature range over which the rate of the reaction H + O2 yields OH + O has been measured, resolving an 18-year-old controversy over the high-temperature behavior of the rate of the most important reaction in combustion. Studies have shown that the rate of the above reaction follows a simple Arrhenius expression, k(T) = 1.62 x 10(exp -10) exp(-7474/T(K)) cm(exp 3)/s, from 960 to 5300 K. Previously, measurements by one group extended only up to 3300 K. At 2600 K, the highest temperature studied by three other groups, the measured rates differed by 220 percent. To obtain the new results, a shock wave was used to quickly heat a sample and the rate of production of OH directly behind the shock wave was measured by tuning the wavelength of a pulsed dye laser to a region of strong absorption by the OH molecule. The strength of this absorption was measured as a function of distance behind the shock wave by directing the light from the laser beam onto a linear-array detector. This technique is capable of measuring the rates of very fast reactions, and is ideal for precise studies at very high temperatures where the rates of chemical reactions are the fastest. DOE

EXPERIMENTAL INVESTIGATIONS AND MOLECULAR DYNAMICS SIMULATIONS OF RADIATION INDUCED SURFACE DAMAGE Final Report, 15 Aug. 1991 - 14 Aug. 1993
P. C. Stair, L. D. Marks, D. Seidman, and E. Weitz Jan. 1994 24 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0303-91)
(AD-A277323; AFOSR-94-0083TR) Avail: CASI HC A03

The research is part of a several year study of the electron stimulated desorption (ESD) behavior of transition metal oxides. The original objective of this research was the development and implementation of an ESD O atom source to be used in Low Earth Orbital (LEO) simulations of materials damage. Though the desorption of neutral particles has been widely postulated, most of the ESD results found in the literature are measurements of ejected ions. The principal reason for this is the ease of ion detection and the inherently low sensitivity of detectors to neutral particles. Most information pertaining to the relative abundance of neutral versus ion desorption is the result of indirect measurements. Despite extensive experimentation including the application of resonant enhanced multiphoton ionization for the selective detection of atomic oxygen the production of atomic oxygen via ESD was never detected. From careful calibration experiments the upper limit to the neutral to ion yield, O/O(+), by ESD was calculated to be 10. From electron microscopy studies of both the reconstructed Ir(001) and Si(001) surfaces, the controversy between the existing models in literature (+/- 0.016 nm for the Ir(001)-5x1 models and +/-0.005 nm for the Si(001)-2x1 models) could be resolved for the first time using a combination of UHV-TED and UHV-HREM techniques. A SEARCH FOR RAPIDITY GAPS IN JET EVENTS AND A STUDY OF COLOR COHERENCE IN MULTIJET EVENTS AT D0
F. Borcherding 1993 10 p Presented at the 9th Workshop on Proton-Antiproton Collider Physics, Tsukuba, Japan, 18-22 Oct. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC02-76CH-03000)
(DE94-006849; FNAL/C-93/388-E; CONF-9310247-12) Avail: CASI HC A02

The authors present studies of Rapidity Gaps and Color Coherence in jet events at the DO Detector for data taken during the recent Tevatron collider run at (radical)s = 1.8 TeV. An upper limit of f((Delta)(eta)(sub c) greater than 3) less than 1.2 x 10(exp -2) at 95% C.L. on the true rapidity gap fraction is given. The color coherence results indicate the angle ordering approximation as modeled in the Herwig Monte Carlo represents the collider as well. DOE

COMPLETE MODEL DESCRIPTION OF AN ELECTRON BEAM USING ACCEPT MONTE CARLO SIMULATION CODE
D. E. Weiss (Minnesota Mining and Mfg. Co., Saint Paul.) and R. P. Kensek 1993 25 p Presented at the International Ultraviolet and Electron Beam Curing Conference and Exhibition, Orlando, FL, 1-5 May 1994
(Contract DE-AC04-94AL-85000)
(DE94-007063; SAND-93-2084C; CONF-940566-2) Avail: CASI HC A03/MF A01

A 3D model of a low voltage electron beam has been constructed using the ITS/ACCEPT Monte Carlo code in order to validate the code for this application and improve upon 1D slab geometry simulations. A line source description update to the code allows complete simulation of a low voltage electron beam with any filament length. Faithful reproduction of the geometric elements involved, especially the window support structure, can account for 90-95% of the dose received by routine dosimetry. With a 3D model, dose distributions in non-web articles can be determined and the effects of equipment modifications can be anticipated in advance. DOE

THE FORM FACTORS OF THE NUCLEONS
G. G. Petratos Dec. 1993 7 p Presented at the Workshop on Electron Nucleus Scattering, Elba, Italy, 5-10 Jul. 1993
(Contract DE-AC03-76SF-00515)
(DE94-007096; SU-SLAC-PUB-6328; CONF-9307145-3) Avail: CASI HC A02/MF A01

The study of the electromagnetic form factors of the nucleons are of fundamental importance in understanding nucleon structure. The form factors contain all the information about the deviation from pointlike structure of the charge and magnetization current distributions of the nucleons. The hope is that measurements at sufficiently large momentum transfers can provide a microscopic understanding of the nucleon wave functions in terms of their constituent quark amplitudes. Recent measurements of the electric G(sub E)(Q(sup 2)) and magnetic G(sub M)(Q(sup 2)) form factors of the nucleons are reviewed and compared to theoretical calculations based on non-perturbative QCD sum rules, diquark, relativistic constituent quark, and vector meson dominance (VMD) models. A short summary of ongoing and future measurements is also presented. DOE

IONIZATION PROBES OF MOLECULAR STRUCTURE AND CHEMISTRY
P. M. Johnson Jan. 1994 6 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-FG02-86ER-13590)
(DE94-007605; DOE/ER-13590/13) Avail: CASI HC A02

The development of new techniques for the study of chemical systems is vital for progress in understanding commercially and environmentally important chemical reactions such as combustion, atmospheric ozone depletion, chemical etching in semiconductor manufacture, etc. The very high light flux obtainable from current tunable lasers enables the user to obtain a diagnostic response from molecules present in extremely small concentrations. It is the goal of this research to understand the photophysics of molecule-laser interactions and to devise new spectroscopic analysis techniques which tell us more about the molecules and enable their detection in difficult environments. With high powered pulsed lasers, an almost inevitable end product of the molecule-laser interaction is ionization of the molecule via the absorption of one or several photons. This provides an opportunity for detection because it is easy to collect and count ions. The challenge is to extract information from the ionization event, which typically does not convey the spectral signatures which allow detailed characterization. The author is presently exploiting the very high Rydberg states present just below the energy of each ionic state as referenced to the neutral ground state. By creating and field ionizing these Rydberg states, he is able to extract the states of the molecular ion from the continuum absorption. When he detects the resulting ion in a mass spectrometer, he calls the technique Mass Analyzed Threshold Ionization (MATI) spectroscopy. The information obtained from the experiment is equivalent to having an infrared spectrum of the ion responsible for each parent mass peak in a mass spectrometer sampling a mixture. The identity and structure of each species can be determined. The bulk of the effort in the last year has been involved with understanding the detailed mechanism of this technique and extending it to allow different light sources. DOE

ADJACENT-CELL PRECONDITIONERS FOR SOLVING OPTICALLY THICK NEUTRON TRANSPORT PROBLEMS
Y. Y. Azmy 1994 9 p Presented at the 8th International Conference on Radiation Shielding, Arlington, TX, 24-27 Apr. 1994
(Contract DE-AC05-84OR-21400)
(DE94-007219; CONF-940424-20) Avail: CASI HC A02/MF A01

We develop, analyze, and test a new acceleration scheme for neutron transport methods, the Adjacent-cell Preconditioner (AP) that is particularly suited for solving optically thick problems. Our method goes beyond Diffusion Synthetic Acceleration (DSA) methods in that it's spectral radius vanishes with increasing cell thickness. In particular, for the ID case the AP method converges immediately, i.e. in one iteration, to 10(exp -4) pointwise relative criterion in problems with dominant cell size of 10 mfp or thicker. Also, the AP has a simple formalism and is cell-centered hence, multidimensional and high order extensions are easier to develop, and more efficient to implement. DOE

MINIMAX: MULTIPARTICLE PHYSICS AT THE TEVATRON COLLIDER
J. D. Bjorken Jan. 1994 6 p Presented at the 23rd International Symposium on Multiparticle Dynamics, Aspen, CO, 13-17 Sep. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC03-76SF-00515)
(DE94-007095; SU-SLAC-PUB-6430; CONF-9309297-5) Avail: CASI HC A02

The author and two dozen others are engaged in a small test/experiment in the Fermilab Tevatron collider. It is called Minimax, and its purpose is to explore large-cross-section physics in the forward direction. The primary goal of Minimax is search for events containing the residue of disoriented chiral condensate (dcc) produced in the primary collision. The theoretical ideas are very speculative. But if they are right, they could provide an interpretation of the Centauro/anti-Centauro anomalies claimed to have been seen in cosmic-ray events. In this paper, the history and status of Minimax is described. DOE

CHIRAL SYMMETRY AND THE THRESHOLD GAMMA(p) YIELDS PI(SUP 0)p REACTION
T. S. H. Lee and B. C. Pearce 1994 15 p
(Contract W-31-109-eng-38)
(DE94-008117; ANL/PHY/PP-71811) Avail: CASI HC A03/MF A01

The threshold gamma p yields pi(sup 0)p reaction is investigated by using a chiral invariant pi N model in a unitary, gauge invariant, dynamical calculation based on a chiral Lagrangian. It is shown that the chiral invariant pi N final state interaction significantly suppresses the E(sub 0+) amplitude from the value -2.4 x 10(exp -3) m(sub pi)(exp -1) predicted by the low energy theorem to -0.66 x 10(exp -3) m(sub pi)(exp -1). We discuss questions concerning the implications of the present results in interpreting the recent Mainz data and their multipole analysis. The experimental accuracy needed for investigating chiral symmetry breaking is illustrated. DOE

RADIATION AND PHOTOCHEMISTRY SECTION Annual Report, Oct. 1992 - Nov. 1993
Nov. 1993 39 p
(Contract W-31-109-eng-38)
(DE94-008880; ANL/RPG-94/1) Avail: CASI HC A03/MF A01

The research described in this survey is a study of transient intermediates and chemistry induced by energetic radiation in the condensed phase. The survey is presented in two major parts: the first one studies ions, excited states, and other transients in the condensed phase; the second one studies the role of solvents in chemical reactivity. Some highlights of the past year were observations of ion-molecule reactions of excited aromatic cations via flash photolysis and transient dc conductivity; anion solvation study revealing role of solvent molecular structure; zeolite matrix study of C7H8 radical cation chemistry; and H atom reaction with O2, I(-), and comparison of diffusion of H, D, and muonium in ice. STUDIES OF JET PRODUCTION WITH THE D0 DETECTOR
H. Weerts (Michigan State Univ., East Lansing.) Jan. 1994 21 p Presented at the 9th Workshop on Proton-Antiproton Collider Physics, Tsukuba, Japan, 18-22 Oct. 1993
(Contract DE-AC02-76CH-03000)
(DE94-008271; FNAL/C-94/035-E; CONF-9310247-21) Avail: CASI HC A03/MF A01

During the first collider run at the Tevatron, the DO experiment has accumulated a large sample of events with jet final states, covering a jet E(sub T) range from about 30 to 400 GeV and pseudorapidities up to eta = 3.2. First results about the transverse energy flow as a function of the jet cone size R are obtained and presented. The study of the two leading E(sub T) jets in events results in a measurement of the dijet angular distribution 1/(sigma)d(sigma)/d(chi) as well as the triple differential cross section d(sup 3)(sigma)/dE(sub T)d(eta)(sub 1)d(eta)(sub 2) over a rapidity region not explored before. The correlation between E(sub T) of two jets and their distance in pseudorapidity is outlined as a test of resummation techniques and compared to a recent theoretical prediction. Finally, distributions are presented characterizing the topology of 3 jet events and they are compared to parton shower Monte Carlo's and to an O(alpha(sub s)(sup 3)) prediction at the tree level. DOE

METAL CLUSTER-RARE GAS VAN DER WAALS COMPLEXES: MICROSCOPIC MODELS OF PHYSISORPTION
W. J. C. Menezes and M. B. Knickelbein 1994 5 p
(Contract W-31-109-eng-38)
(DE94-008134; ANL/CHM/PP-75637) Avail: CASI HC A01/MF A01

The first examples of metal cluster-rare gas van der Waals complexes have been produced using a molecular beam technique, providing novel microscopic models of rare gas physisorption phenomena that occur at low temperatures on extended metal surfaces. These studies show that the formation efficiency of these complexes vary dramatically with the number of metal atoms in the cluster. An interesting example is provided by iron clusters, in which the 13-atom iron cluster is relatively inert toward complexation with krypton atoms, whereas the neighboring 12- and 14-atom clusters form krypton adducts readily. Such results provide valuable insights into the surface topology (i.e., 'smoothness' or 'roughness') of metal clusters, which may in turn aid in developing a detailed microscopic understanding of related systems of technological interest, ranging from heterogeneous catalysts to cluster-assembled materials. ELECTRON: CLUSTER INTERACTIONS
A. A. Scheidemann (Washington Univ., Seattle.), V. V. Kresin, and W. D. Knight Feb. 1994 19 p Presented at the Workshop on Positron Interactions With Atoms, Molecules and Clusters, Bielefeld, Germany, 14-17 Jul. 1993
(Contract W-7405-eng-48)
(DE94-009089; UCRL-JC-116383; CONF-930715-2) Avail: CASI HC A03/MF A01

Beam depletion spectroscopy was used to measure absolute total inelastic electron-sodium cluster collision cross sections in the energy range from E approximately 0.1 to E approximately 6 eV. The investigation focused on the closed shell clusters Na8, Na20, and Na40. The measured cross sections show an increase for the lowest collision energies where electron attachment is the primary scattering channel. The electron attachment cross section can be understood in terms of Langevin scattering connecting this measurement with the polarizability of the cluster. For energies above the dissociation energy, the measured electron-cluster cross section is energy independent, thus defining an electron-cluster interaction range. This interaction range increases with the cluster size. DOE

CP VIOLATION AND THE TOP QUARK
D. Atwood Feb. 1994 3 p Presented at the 2nd International Workshop on Physics and Experiments at Linear E(sup +)e(sup -) Colliders; European Workshop at DESY, Waikoloa, HI, 26 Apr. - 3 May 1993
(Contract DE-AC03-76SF-00515)
(DE94-008930; SU-SLAC-PUB-6434; CONF-9304229-1) Avail: CASI HC A01/MF A01

We consider signals of CP violation in semi-leptonic decay of the top quark. We show that the transverse polarization asymmetries of the (tau)-lepton in the decay t yields brv is extremely sensitive to CP violation. As an illustration, we consider CP phases arising from the charged Higgs exchange in the Weinberg three Higgs doublet model. Qualitatively, the polarization asymmetries are enhanced over rate or energy asymmetries by a factor of O(m(sub t)/m(sub r)) is approximately equal to 100 with a corresponding increase in sensitivity to CP violating parameters. We also examine (tau) polarization in b decays via b yields cvr and find that may also be very effective in constraining CP violating effects such as those that arise from an extended Higgs sector. DOE

STRING-PARTON MODEL DESCRIPTION OF RELATIVISTIC HEAVY-ION COLLISIONS
A. S. Umar, D. J. Dean, and Strayer 1993 10 p Presented at the NATO Advanced Study Institute on Hot and Dense Nuclear Matter, Bodrum, Turkey, 26 Sept. - 9 Oct. 1993
(Contracts DE-AC05-84OR-21400; DE-FG05-87ER-40376)
(DE94-009164; CONF-930999-9) Avail: CASI HC A02/MF A01

Various models have been developed to address the ordinary hadronic physics that occurs in relativistic heavy-ion collisions. These include string-based fragmentation models such as the LUND model and its extensions in FRITIOF, which assume that excited hadrons behave as a chain of color dipoles that move like one dimensional relativistic strings. Interactions are introduced via multiple small momentum exchanges between the color dipoles of two overlapping strings. Other nondynamical models are the dual-parton model, in which the strings are formed by soft gluon exchange between the valence partons of the colliding hadrons. The quark-gluon string model, also based on the dual parton model, has been developed to study soft parton collisions and includes rescattering. The strings in the above models are in fact one dimensional constructions in momentum space, and string evolution is carried out in this space. We have developed a real-time dynamical model for studying the inclusive properties of hadronic collisions in three dimensions. The model is based on the Nambu-Goto string description of hadrons supplemented by extensions to incorporate the basic features of the parton model, together with a hadronization mechanism. The advantage of having a fully dynamical model is the possibility to explore the detailed time evolution of the hadronic matter. Furthermore, since the model is fully three dimensional, all of the transverse degrees of freedom are available to the evolving system. The model has been successfully applied to the study of high-energy e(+)e(-), pp, mu p, and mu A collisions. These calculations have been used to fix all of the parameters present in the model. For all of the calculations presented here, the model parameters have been held fixed at their predetermined values. DOE

STRUCTURAL STUDIES OF PHOTOINDUCED INTRAMOLECULAR ELECTRON TRANSFER IN CYCLOPENTADIENYLNICKELNITROSYL
L. X. Chen, M. K. Bowman, Zhi-Yu Wang, J. R. Norris, and P. A. Montano 1994 52 p
(Contract W-31-109-eng-38)
(DE94-008467; ANL/CHM/PP-80920) Avail: CASI HC A04/MF A01

A structural study based on EXAFS, FTIR, and optical absorption spectroscopies was conducted on a photogenerated, metastable state of cyclopentadienylnickelnitrosyl (CpNiNO) produced by a reversible photochemical reaction. The photogenerated, metastable state with distinctively different EXAFS, IR, and optical absorption spectra from those of the ground state molecules was created by irradiating the sample with the 365 nm line of a mercury lamp at 20K . At the same temperature, the reverse reaction was induced by irradiation with the 313 nm line from the mercury lamp. Based on the analysis of the EXAFS data, the photogenerated, metastable state of CpNiNO has undergone considerable nuclear rearrangements compared to its ground state. The nuclear movement is characterized by a 0.12 a elongation of Ni-N bond and by a bending of Ni-N-O. A shift of the N-O stretching frequency from 1824 to 1387 cm(exp -1) was observed in the photoinduced reaction with 365 nm light, implying that a NO(-) like species results from intramolecular electron transfer from Ni to NO. The changes in the absorption spectra for the same reaction showed reduced absorption of the 385 nm band and a newly generated broad band near IR region. Temperature dependence of the Debye-Waller factor of CpNiNO was in good agreement with the diatomic harmonic oscillator for the Ni-N bond, but deviated for the Ni-O and the Ni-C bonds. Based on the structures obtained from EXAFS, ZINDO calculations for both the ground state and the photogenerated, metastable state of CpNiNO reproduced the general features of the observed absorption spectra and qualitatively explained the wavelength dependence of the reaction. The calculated partial charges on each atom in the ground state and the photogenerated, metastable state of CpNiNO are consistent with intramolecular electron transfer upon photoexcitation by 365 nm light. COHERENT PROCESSES IN ATOM IN STRONG RADIATION FIELDS Final Report, 1 Feb. 1991 - 30 Sep. 1993
C. W. Clark and T. J. McIlrath 30 Sep. 1993 5 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0109-91)
(AD-A278388; AFOSR-94-0215TR) Avail: CASI HC A01

During this grant period work proceeded to study alternative methods of integrating the higher dimensional time-dependent partial differential equations that arise in the study of atoms interacting with intense laser radiation. Present methods use, for example, Taylor series propagators applied to finite difference and basis set models. We have more recently developed modified propagators based on polynomial extrapolation and rational polynomial extrapolation (Buelisch-Stoer) and have prepared versions that can be effectively vectorized on Cray YMP computers, and in the case of polynomial extrapolation, parallelized on massively parallel

computers. In addition, the stability and accuracy of the finite difference models have been compared to those based on interpolatory splines. The main effort in this grant was directed toward developing numerical integrators for the Schroedinger equation describing the interaction on atoms with circularly polarized light. DTIC

SPIN-STRUCTURE FUNCTION OF THE NEUTRON He-3: SLAC RESULTS
Z. E. Meziani Nov. 1993 5 p Presented at the 14th European Conference on Few-Body Problems in Physics, Amsterdam, Netherlands, 22-27 Aug. 1993
(Contracts DE-AC03-76SF-00515; DE-FG03-88ER-40439)
(DE94-008927; SLAC-PUB-6393; CONF-9308164-8) Avail: CASI HC A01/MF A01

A first measurement of the longitudinal asymmetry of deep-inelastic scattering of polarized electrons from a polarized He-3 target at energies ranging from 19 to 26 GeV has been performed at SLAC. The spin-structure function of the neutron g(sub 1)(sup n) was extracted from the measured asymmetries allowing for a test of the Ellis-Jaffe and Bjorken sum rules. The Quark Parton Model (QPM) interpretation of the nucleon spin-structure function is examined in light of the new results. DOE

A TANDEM MICROSCOPIC-ELECTROCHEMICAL EXAMINATION OF A CHARGE-INDUCED SURFACE PHASE SEQUENCE: ORDERED Au(110) IN AQUEOUS IODIDE ELECTROLYTES AS PROBED BY POTENTIODYNAMIC SCANNING TUNNELING MICROSCOPY
Xiaoping Gao, Gregory J. Edens, and Michael J. Weaver Feb. 1994 49 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1409)
(AD-A276905; TR-152) Avail: CASI HC A03

Atomic-level structural and dynamical aspects of the electrode potential-induced sequence of surface phases on ordered Au(110) in dilute aqueous alkali iodide electrolytes have been explored by scanning tunneling microscopy (STM) coupled with cyclic voltammetry. This system exhibits a potentially rich series of electro-induced phase transitions triggered primarily by increasing iodide adsorption towards more positive potentials, together with alkali cation coadsorption. Exploration of the real-space phase-transition dynamics, in particular, is facilitated by means of 'potentiodynamic' STM image sequences obtained during potential steps or especially voltammetric sweeps, thereby providing a direct link to conventional (macroscopic) electrochemical phenomena. At the most negative potentials, beyond ca -0.7 V vs SCE, Au(110) forms a largely uniform (1 x 3) phase. The microscopic steps associated with the formation and iodide adsorbate-induced removal of this reconstruction were examined by potentiodynamic STM. In cesium iodide electrolyte, 'one-missing-row' (1 x 3) and (1 x 2) regions are seen to be formed by periodic row displacement en route to the final 'three-missing-row' (1 x 3) phase. DTIC

Deep inelastic polarized lepton-nucleon scattering is reviewed in three lectures. The first lecture covers the polarized deep inelastic scattering formalism and foundational theoretical work. The second lecture describes the nucleon spin structure function experiments that were performed up through 1993. The third lecture discusses the implications of the results and future experiments aimed at high-precision measurements of the nucleon spin structure functions. DOE

Particle bed reactors (PBR's) are being developed for both space power and propulsion applications. These reactors operate with exhaust gas temperatures of 2500 to 3000 K and fuel temperatures hundreds of degrees higher. One fuel design for these reactors consists of uranium carbide encapsulated in either carbon or graphite. This fuel kernel must be protected from the coolant gas, usually H2, both to prevent attack of the kernel and to limit fission product release. Refractory carbide coatings have been proposed for this purpose. The typical coating process used for this is a chemical vapor deposition. Testing of other components have indicated the superiority of refractory carbide coatings applied using a chemical vapor reaction (CVR) process, however technology to apply these coatings to large numbers of fuel particles with diameters on the order of 500 pm were not readily available. A process to deposit these CVR coatings on surrogate fuel consisting of graphite particles is described. Several types of coatings have been applied to the graphite substrate: NbC in various thicknesses and a bilayer coating consisting of NbC and TaC with a intermediate layer of pyrolytic graphite. These coated particles have been characterized prior to test; results are presented. DOE

HIGH ENERGY PHYSICS PROGRAM AT THE UNIVERSITY OF ALABAMA Annual Report
L. Baksay and J. K. Busenitz Oct. 1993 50 p
(Contract DE-FG05-84ER-40141)
(DE94-006544; DOE/ER-40141/T1) Avail: CASI HC A03/MF A01

The High Energy Physics group at the University of Alabama is a member of the L3 collaboration studying e(sup +)e(sup -) collisions near the Z degree pole at the LEP accelerator at CERN. About 2 million Z degree events have been accumulated and the experiment has been prolific in publishing results on the Z resonance parameters, the Z couplings to all leptons and quarks with mass less than half the Z mass, searches for new particles and interactions, and studies of strong interactions and/or weak charged current decays of quarks and leptons abundantly produced in Z decays. They are contributing to data analysis as well as to detector hardware. In particular, they are involved in a major hardware upgrade for the experiment, namely the design, construction, and commissioning of a silicon microvertex detector (SMD) which has successfully been installed for operation during the present grant period. A report is presented on their recent L3 activities and their plans for the next grant period of twelve months (1 Apr. 1994 - 31 Mar. 1995). Their main interests in data analysis are in the study of single photon final states and the physics made more accessible by the SMD, such as heavy flavor physics. Their hardware efforts continue to be concentrated on the high precision capacitive and optical alignment monitoring systems for the SMD and also includes gas monitoring for the muon system. They are also planning to participate in the coming upgrade of the L3 detector. DOE

RHIC SPIN PHYSICS
G. Bunce 1993 6 p Presented at the 5th International Workshop on High Energy Spin Physics, Protvino, Russia, 20-24 Sep. 1993
(Contract DE-AC02-76CH-00016)
(DE94-005452; BNL-49719; CONF-9309323-1) Avail: CASI HC A02/MF A01

The physics potential of colliding beams of protons, polarized either longitudinally or transversely, at RHIC is remarkable. A luminosity of L = 2 x 10(exp 32) cm(exp -2) sec(exp -1) with 70 percent polarized beams will be available with up to 250 GeV energy in each beam. The proposal to collide polarized protons in RHIC was submitted in August 1992 and approved in October 1993, just after this workshop. The collaboration has been encouraged to complete research and development on Siberian Snakes, so that RHIC will be able to accelerate polarized protons early in its program. The expected date of the first heavy ion collisions is 1999. The spin physics program includes measurement of gluon and sea quark polarization in the longitudinally polarized proton, measurement and then application of parity violation in W and Z production, measurement of hard scattering parton-parton asymmetries, and quark polarization or transversity in transversely polarized protons. Single spin asymmetries allow sensitive searches for parity violation (longitudinal polarization) and correlations between quark spin and gluons (transverse). Probes include direct photons (to p(sub T) = 20 GeV/c), jets (to p(sub T) greater than 50 GeV/c), Drell-Yan pairs (to m(sub ll) = 9 GeV), W(sup +/-), and Z. Here, the collaboration emphasizes the new information included in the update, given to the Brookhaven PAC this September. DOE

Progress on problems in quantum gravity and QCD, made during the period Sep. 92 - Sep. 93, and proposed research for the coming year are summarized. Over the last year the author has proposed a dynamic mechanism underlying the observed Lorentzian signature of spacetime and a new quantization scheme for gravity, based on a transfer matrix approach. This transfer matrix formulation is not only a possible solution for the well-known 'problem of time' in quantum gravity, but also predicts that Newton's constant is not really a constant: it should be subject to quantum fluctuations. In addition, together with two European collaborators, the author has done some further work on the abelian projection model of quark confinement. This work in quantum gravity and QCD has been reported in various publications, and the author briefly describes each of these investigations. DOE

The United States has a superb capability for forefront research in elementary particle physics for the next decade -- but it can be realized only if there is sufficient funding to make efficient use of our existing world-class facilities. Throughout most of the past half century, the US has led the world in making contributions to our growing understanding of elementary particle physics. We are no longer the dominant force in the field, but we are still one of the leaders. The termination of the SSC is an enormous blow, but it need not end our participation in the field. We must first take advantage of what we have -- and that is considerable -- and then use it as the basis for a successful strategy for the first few decades in the next century. The US can make many important contributions to our field for the rest of this decade and for part of the next. But, after that, we will not long remain among the world's leaders unless we have the foresight to preserve and strengthen our capability to construct and operate world-class facilities. DOE

PARTICLE DIFFUSION FROM THE BEAM-BEAM INTERACTION IN SYNCHROTRON COLLIDERS
J. K. Koga and T. Tajima Jan. 1994 13 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-FG05-80ET-53088)
(DE94-007111; IFSR-636; DOE/ET-53088/636) Avail: CASI HC A03

The authors investigate the beam-beam interaction in a synchrotron collider, specifically studying slow particle diffusion in phase space away from tune resonances. Using the tune and tune shift of contemporary large hadron colliders as reference parameters, the computation shows all particles diffusive after 10(exp 5) rotations in contrast to previous single particle tracking results. The diffusion coefficients are several orders of magnitude higher than the tracking code and increase exponentially with the action, caused by the collision induced variation of the second moment of the beams (x(exp 2)). The experimental efforts over the past 5 years have been aimed at carrying out inertial confinement fusion (ICF) shots with spin-polarized D fuel. The authors successfully prepared polarized D in HD, and solved the problems of loading target shells with their carefully prepared isotopic mixtures, polarizing them so that the D polarization remains metastably frozen-in for about half a day, and carrying out the various cold transfer requirements at Syracuse, where the target is prepared, and at Rochester, where the cold target is inserted into the OMEGA fusion chamber. A principal concern during this past year was overcoming difficulties encountered in maintaining the integrity of the fragile cold target during

the multitude of cold-transfers required for the experiment. These difficulties arose from insufficient rigidity of the cold transfer systems, which were constrained to be of small diameter by the narrow central access bore of the dilution refrigerator, and were exacerbated by the multitude of required target shell manipulations between different environments, each with different coupling geometry, including target shell permeation, polarization, storage, transport, retrieval and insertion into OMEGA. The authors did solve all of these problems, and were able to position a cold, high density but unpolarized target with required precision in OMEGA. Upon shooting the accurately positioned unpolarized high density cold target, no neutron yield was observed. Inspection inside the OMEGA tank after the shot indicated the absence of neutron yield was due to mal-timing or insufficient retraction rate of OMEGA's fast shroud mechanism, resulting in interception of at least 20 of the 24 laser beams by the faulty shroud. In spite of this, all elements of the complex experiment the authors originally undertook have been successfully demonstrated, and the cold retrieval concepts and methods they developed are being utilized on the ICF upgrades at Rochester and at Livermore. DOE

HYPERON POLARIZATION, CRYSTAL CHANNELING, AND E781 AT FERMILAB
J. Lach Jan. 1994 19 p Presented at the US/Japan Seminar on Hyperon-Nucleon Interactions, Maui, HI, 24-28 Oct. 1993
(Contract DE-AC02-76CH-03000)
(DE94-008224; FNAL/C-94/031; CONF-9310259-4) Avail: CASI HC A03/MF A01

Early experiments at Fermilab observed significant polarization of inclusively produced hyperons. These and subsequent experiments showed that lambda0 were produced polarized while lambdabar0 had no polarization in the same kinematical region. Other hyperons and antihyperons were also seen to be polarized. Recent Fermilab experiments have showed this to be a rich and complex phenomena. Theoretical understanding is still lacking. Fermilab E761 has shown that bent single crystals can be used to process the polarization of hyperons and from the precession angle measure the hyperon's magnetic moment. This opens the possibility of measuring the magnetic moments of charmed baryons. Finally, I will briefly discuss Fermilab E781, an experiment designed to study charmed particle production by sigma(-) hyperons. DOE

INDEPENDENT SAFETY ASSESSMENT OF THE TOPAZ-2 SPACE NUCLEAR REACTOR POWER SYSTEM
Sep. 1993 31 p Revised
(DE94-008653; DOE/NE-0001P) Avail: CASI HC A03/MF A01

The independent safety assessment described in this study report was performed to assess the safety of the design and launch plans anticipated by the U.S. Department of Defense (DOD) in 1993 for a Russian-built, U.S.-modified TOPAZ-2 space nuclear reactor power system. Its conclusions, and the bases for them, were intended to provide guidance for the U.S. Department of Energy (DOE) management in the event that the DOD requested authorization under section 91b. of the Atomic Energy Act of 1954, as amended, for possession and use (including ground testing and launch) of a nuclear-fueled, modified TOPAZ-2. The scientists and engineers who were engaged to perform this assessment are nationally-known nuclear safety experts in various disciplines. They met with participants in the TOPAZ-2 program during the spring and summer of 1993 and produced a report based on their analysis of the proposed TOPAZ-2 mission. Their conclusions were confined to the potential impact on public safety and did not include budgetary, reliability, or risk-benefit analyses. DOE

THE CONOSCOPIC MICROSCOPE Ph.D. Thesis [LE MICROSCOPE CONOSCOPIQUE]
Eric LeFahler 1993 121 p In FRENCH Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0751-1353)
(TELECOM-93-E-017; ETN-94-95903) Avail: CASI HC A06

The understanding, study and development of the conoscopic microscope is addressed. A conoscopic holography approach based on physical optics (wave method) was developed. The three dimensional (3D) optical transfer function computation of a conoscopic system was developed. The 3D optical transfer function concept was extended to an optoinformatic system. This 3D optical transfer function will serve as a general tool for modeling conoscopic systems. A conoscopic microscope was physically realized. This necessitated a dimensioning study and test and implementation of optical electronic and computer components. The required software package for using the microscope was built. The influence of different physical and technological parameters (light quantity, measurement stability, precision, repeatibility, etc.) on this system were quantified. The microscope was tested on different hardware types (glass, silicon platelet, InP platelet) and satisfactory surface measurements were obtained. ESA

FINAL RESULTS FROM THE SDC DOPANT SEARCH FOR NEW GREEN WAVELENGTH SHIFTING (WLS) FIBERS, VOLUME 1
A. Pla-Dalmau, G. W. Foster, and G. Zhang Dec. 1993 99 p
(Contract DE-AC02-76CH-03000)
(DE94-006744; FNAL-TM-1873-Vol-1) Avail: CASI HC A05/MF A02

A scintillating tile/fiber design had been selected for the SDC calorimeter. It consisted of scintillator plates embedded with a wavelength shifting (WLS) fiber which was spliced to a clear fiber. Based on the results from previous radiation damage studies on different scintillating materials, SCSN38 had been chosen for the scintillating tile and BCF91 or Y7 for the WLS fiber. SCSN38 is a blue-emitting scintillator and both WLS fibers use K-27, a green-emitting compound, as dopant. K-27 has a decay time of approximately 12 ns which is long in comparison to that of most blue-emitting materials. Of all the factors that affect the speed of the scintillator tile/fiber calorimeter, the lifetime of the green-emitting dopant is the dominant component. To increase the speed of the calorimeter, it would be desirable that the green WLS fibers utilized had lifetimes between 3 and 5 ns. However, currently available green WLS fibers exhibit decay times between 7 and 12 ns. Development of new green-emitting WLS fibers with short decay times must be investigated. The goal of this project was to search for commercially available fluorescent compounds with lambda(sub abs) = 400-450 nm, lambda(sub em) = 450-550 nm, tau = 3-7 ns, and quantum efficiency of minimum 0.7 (current K-27 baseline). Large Stokes shift and low self-absorption were not important requirements since the optical pathlength for the shifted light was small. Characterization of the spectroscopic properties of these compounds after styrene polymerization is important since this is an essential part of the manufacturing of WLS fibers. This summary presents the transmittance and fluorescence data for each dopant tested. However, many fluorescence measurements using different excitation wavelengths and orientations were recorded. Volume 1 presents a plot for each dopant combining transmittance and the most representative fluorescence measurement. DOE

ADVANCED OPTICAL FIBER COMMUNICATION SYSTEMS Status Report, 1 Aug. 1993 - 1 Mar. 1994
Leonid G. Kazovsky 1 Mar. 1994 36 p
(Contract N00014-91-J-1857)
(AD-A276416) Avail: CASI HC A03/MF A01

Our research is focused on three major aspects of advanced optical fiber communication systems: dynamic wavelength division multiplexing (WDM) networks, fiber nonlinearities, and high dynamic range coherent analog optical links. In the area of WDM networks, we have designed and implemented two high-speed interface boards and measured their throughput and latency. Furthermore, we designed and constructed an experimental PSK/ASK transceiver that simultaneously transmits packet-switched ASK data and circuit-switched PSK data on the same optical carrier. In the area of fiber nonlinearities, we investigated the theoretical impact of modulation frequency on cross-phase modulation (XPM) in dispersive fibers. In the area of high dynamic range coherent analog optical links, we developed theoretical expressions for the RF power transfer ratio (or RF power gain) and the noise figure (NF) of angle-modulated links. We then compared the RF power gains and noise figures of these links to that of an intensity modulated direct detection (DD) link. DTIC

CHAMBER OPTICS FOR TESTING PASSIVE REMOTE SENSING VAPOR DETECTORS Final Report, Jan. - Jun. 1993
Dennis F. Flanigan Nov. 1993 59 p
(DA Proj. 104-63806-D-601)
(AD-A275909; ERDEC-TR-127) Avail: CASI HC A04/MF A01

There is a need to test the response of multiple remote sensing FTS to known concentrations of vapors with a carefully controlled temperature difference, delta T, between a background source, T(sub bg), and the gas, T(sub g). We have analyzed the various factors inherent in delivering a beam of specified radiance to the sensor including: the geometrical factors needed to assure that the background source fills the field of view, methods of multisensor viewing, and the effects of the transmittance of the additional optical elements. Several optical configurations will deliver a suitable beam. The telescopically based system delivers a spatially similar beam to what the sensor would see in the field. The two-lens system delivers an image at the entrance aperture that is functionally equivalent to a collimated beam at least for single detector spectroradiometers. The radiance analysis showed that the position of the optical elements is important. These results suggest that there is very little penalty to a one window cell, which might be substantially easier to design and build than a windowless cell. DTIC

SINGLE SCATTERING OF LIGHT BY ENSEMBLES OF PARTICLES WITH VARIOUS SHAPES Ph.D. Thesis
Foeke Kuik 1992 145 p
(ETN-94-96016) Avail: CASI HC A07/MF A02

Single scattering properties of ensembles of randomly oriented small particles are addressed. Results for computed, as well as measured, scattering matrices as functions of scattering angle are presented. Computational results, mainly pertaining to spheroids and finite cylinders, are discussed. Experimental work pertaining to ensembles of water droplets, randomly oriented SiO2 particles, and H2O ice crystals, is discussed. ESA

(PB94-148061; FOA-C-30730-3.1) Avail: CASI HC A03

A sensor element for measurement of low frequency magnetic fields has been developed. The element is based on the amorphous magnetostrictive material Vitrovac 4040. An optical fiber was glued to a thin strip of this material and strain originating from a magnetic field was measured. The strain was detected with a Mach-Zehnder interferometer. The output signal was fed back to the sensor element using a small solenoid. The measurement signal then became highly linear. Experiments show high directionality for the sensor. The minimum detectable flux density was 3nT/(square root of Hz) using an effective fiber length of 40 cm and a carrier at 1 mT. Considerably higher sensitivity is expected with a better sensor element and better signal processing. Polarization drift in the interferometer was also a limiting factor. The report contains a theoretical review of relevant magnetic field theory and interferometry. The experimental arrangement and the results obtained are described. Finally, results and possible improvements to the system are discussed. NTIS

FIBER OPTIC SENSORS FOR THE DETECTION OF SURFACE ACOUSTIC WAVES ON METALS M.S. Thesis
Derek John Glennie 1993 109 p
(ISBN-0-315-87055-9; CTN-94-61244) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The theory of fiber optic strain sensors for surface acoustic waves is explained along with the theory of laser generated ultrasound and modifications to the acoustic source generated when a laser pulse illuminates

a metal surface. Experiments were conducted to determine if surface acoustic waves could be generated on metal surfaces by a Nd-YAG laser pulse and whether a fiber optic Michelson interferometer could detect the waves in various configurations. Surface waves could indeed be generated and detected as hypothesized, and further experiments examined the decay of the surface acoustic waves with distance, the effects of varying the length of one arm of the acoustic wave sensor, and the acoustic wave amplitude versus laser pulse energy. To increase the amplitude of the surface acoustic waves without damaging the sample surface, a circular lens, a cylindrical lens, and a mask were used to modify the laser pulse before it illuminated the sample. Two experiments were conducted to determine if the interferometer could be used to investigate corrosion on the sample surface. On the basis of three corrosion simulations performed, the applicability of using that sensor for corrosion detection is in doubt. CISTI

OPTIMIZATION OF Y JUNCTIONS IN INTEGRATED OPTICS M.S. Thesis [OPTIMISATION DE JONCTIONS Y EN OPTIQUE INTEGREE]
Louis Roy Nov. 1993 79 p In FRENCH
(ISBN-0-315-86782-5; CTN-94-61228) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Optical Y-junctions are one of the biggest limitations to the integration of optical circuits. A new approach is presented for increasing the angle of separation of the branches while limiting the radiation losses in the junction. Starting from the phenomenon of diffraction in three slots, a recreation of which is attempted in an optical waveguide, a study is presented of the behavior of the field in a structure which locally accelerates the phase front of the incident wave. Structures are proposed which prepare the field to change direction before being injected into branches. In spite of the difficulty of recreating the three-slot diffraction phenomenon, the final structure of the junction is nevertheless an improvement due to the phenomenon of local acceleration of the phase front which helps the separation of the incident wave. SYNCHRONIZED LASER SCANNING THREE DIMENSIONAL ACQUISITION SYSTEM M.S. Thesis [SYSTEME D'ACQUISITION 3-D A BALAYAGE LASER SYNCHRONISE]
Jean-Francois Tremblay Feb. 1993 81 p In FRENCH
(ISBN-0-315-86848-1; CTN-94-61233) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A three dimensional vision system is presented which is capable of providing the distance of objects on a 256 by 256 mesh coordinated in azimuth and in elevation. A scanner module added to an existing Jupiter camera of Servo-Robot Inc. allows directing the laser beam to a desired location. The camera, originally with one axis of rotation, was modified to have two axes of rotation. The supplementary axis works in strict relationship with the original scanning mechanism of the camera. The calibration method is modified to take into account this additional mechanism. The new module is carefully integrated with the camera which remains compact and lightweight so that it can easily be used by small robots. The characteristics of the Jupiter camera and the modified final product are described. The design of the second axis of rotation is reviewed with respect to the mechanical design and to the modifications of the controller electronics and software. Finally, the methods used for calibrating the second axis of rotation are summarized along with the results of representative experiments which illustrate some of the images captured by the new three dimensional camera. MANUFACTURE OF LIGHT-DAMAGE RESISTANT, PLANAR, SINGLE MODE WAVEGUIDE ON LITHIUM NIOBATE Interim Progress Report Phase 1, 1 Jul. 1988 - 31 Mar. 1989
Velimir M. Ristic Mar. 1989 60 p
(DSIS-94-01503; CTN-94-61257) Avail: CASI HC A04/MF A01

The photorefractive effect in LiNbO3 waveguides is described with reference to the origin of internal fields, the effects of impurities and atomic radii, and the energy level model for grating formation in a photorefractive material. It is evident that contamination of the crystal contributes to the photorefractive effect, and processing procedures are detailed which can be used to fabricate LiNbO3 devices while minimizing contamination. The photorefractive effect, also called optical damage, has both photovoltaic and photoconductive components and is mainly due to the photoionization of Fe(2) to the Fe(3) state and the generation of a free electron. Photorefractive effects in LiNbO3 channel waveguides were modelled theoretically and the models were experimentally verified. The electro-optically induced refractive index changes were measured by interferometric techniques. A thermal fixing technique to reduce photorefractive susceptibility was also modelled and tested. This technique relies on the mobility of H(+) ions at elevated temperatures. CISTI

INVESTIGATION OF SCINTILLATOR AND FIBRE LIGHT IN PLASTIC SCINTILLATION DOSIMETRY M.S. Thesis
Steven Francis DeBoer 1993 129 p
(ISBN-0-315-87190-3; CTN-94-61252) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Plastic scintillation dosimetry is a new and promising method of measuring dose in a radiation therapy beam. In this dosimetry system, the light signal produced in a miniature scintillator is transmitted to a photomultiplier tube via fiber optic cables. This system offers many advantages over conventional dosimetry methods, but an undesired radiation induced light signal is produced in the optical fibers. In an investigation of this new dosimetry system, work focused on methods to increase the scintillator to fiber light ratio. Examination of the Cerenkov light produced in the fiber light has led to the development of equations that describe the collection of this light as a function of the fiber orientation within the electron beam for different fibers and different electron beam angular distributions. The results indicated that an increase in the scintillator to fiber light ratio by a factor of 2:1 is achievable by scintillator light shifting and optical filtering of the fiber light signal. An additional factor of 7:1 is expected from a theoretical analysis of the addition of coatings to the scintillator surface. Author (CISTI)

In this quarter we have completed an extensive paper on native point defects in Hg(0.8)Cd(0.2)Te, and submitted it to Physical Review B. We calculated the binding energy of a mercury vacancy tellurium anti-site defect complex in Hg(0.8)CdTe and estimated the complex density and its consequences on materials processing. The defect formation energies in CdTe and ZnSe, including gradient corrections to the local density approximation, were calculated, and estimates of the neutral defect concentrations in ZnSe were made. We have continued to develop a method to calculate the defect ionization energies in CdTe, ZnSe, and LiNbO3. Preliminary prediction of the defect densities in x=0.17 LWIR Hg(1-x)Zn(x)Te were made and compared to results in HgCdTe. We continued to develop a method to calculate the temperature dependence of the semiconductor bandgaps. Modifications of our thermodynamical codes for the LiNbO3 problem were made so that the stoichiometry and temperature may be specified and the defect densities determined. DTIC

The transmission spectra in the wavelength range of 400 nm to 1000nm have been studied with sinusoidal phase transmission gratings formed on photo-resist materials on glass substrates and dielectric mirrors (filters) formed by depositing multiple and alternate layers of 'High' and 'Low' inorganic dielectric materials on glass and polycarbonate substrates. With the sinusoidal crossed two groove profiles transmission gratings of groove depth approx. 896 on a single substrate a transmission was of less than 1% at 500-680nm and the transmittance did not exceed l2% over the entire range of 400-1000nm. The transmission over the visible part of the wavelength was poor although the gratings satisfied the required specification. The multiple layer all dielectric mirror, produced on one surface of a polycarbonate substrate (50mmx50mmx3mm) satisfied the following specification: less than 0.5% transmission at 532nm, less than 1.0% transmission from 694nm, 50% transmission from 400nm to 500nm and from 560 nm to 600 nm. The performance mentioned above satisfied adequately the required specification. DTIC

There is little doubt than an electronically steered, stationary scanning antenna offers significant advantages over any gimbaled installation, especially for tactical missile seekers. A scanning phased array antenna reduces the demands on space and power and makes better use of the space available. It is widely believed that the millimeter wave (MMW) band (W-band) is the region of the RF spectrum which provides the best angular resolution. In fact, MMW sensor and seeker technologies have made significant advances in recent years, demonstrating their suitability for autonomous adverse weather, battlefield, and smart munition applications. Moreover, only the use of the W-band can produce an active seeker with imaging capability for on-board target identification. DTIC

DESIGN AND CHARACTERIZATION OF A PULSED X RAY SOURCE FOR FLUORESCENT LIFETIME MEASUREMENTS
S. C. Blankespoor (California Univ., Berkeley.) Dec. 1993 32 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC03-76SF-00098)
(DE94-007495; LBL-35092) Avail: Issuing Activity (Department of Energy (DOE))

To search for new, fast, inorganic scintillators, the author and his colleagues have developed a bench-top pulsed x-ray source for determining fluorescent lifetimes and wavelengths of compounds in crystal or powdered form. This source uses a light-excited x-ray tube which produces x-rays when light from a laser diode strikes its photocathode. The x-ray tube has a tungsten anode, a beryllium exit window, a 30 kV maximum tube bias, and a 50 HA maximum average cathode current. The laser produces 3 x 10(exp 7) photons at 650 nm per approximately 100 ps pulse, with up to 10(exp 7) pulses/sec. The time spread for the laser diode, x-ray tube, and a microchannel plate photomultiplier tube is less than 120 ps fwhm. The mean x-ray photon energy, at tube biases of 20, 25, and 30 kV, is 9.4, 10.3, and 11.1 keV, respectively. They measured 140, 230, and 330 x-ray photons per laser diode pulse per steradian at tube biases of 20, 25, and 30 kV, respectively. Background x-rays due to dark current occur at a rate of 1 x 10(exp 6) and 3 x 10(exp 6) photons/sec/steradian at tube biases of 25 and 30 kV, respectively. Data characterizing the x-ray output with an aluminum filter in the x-ray beam are also presented. DOE

DEVELOPMENT OF PHASE-ONLY FILTERS FOR SENSOR IMAGERY Final Report, Mar. - Nov. 1993
Samuel P. Kozaitis Dec. 1993 33 p
(Contract F30602-93-C-0024)
(AD-A276722; RL-TR-93-248) Avail: CASI HC A03/MF A01

We used the statistical technique of factor analysis to design binary and ternary optical correlation filters to identify objects in the presence of unknown or non-repeatable distortions. We considered values of spatial frequencies of training set imagery as features and used those spatial frequencies in our filter depending on their variation across a training set. In addition, we provided general expressions for performance measures as a function of training set imagery. The potential of our approach was evaluated with infrared sensor imagery that varied in an unknown way. Our statistically designed filters were easily calculated and performed well in the presence of noise. Furthermore, the performance of our filters were varied by allowing for trade-offs in performance measures. Our filters reduced the sensitivity of binary and ternary phase-only filters to changes in an object's appearance when the input imagery varied in an unknown manner. DTIC

The University of California has conducted research on soft x-ray physics, optics and applications thereof to the physical and life sciences. With support from the Air Force Office of Scientific Research, the University was able to develop a student research and training program. In combination with support from the DOE and, more recently, DOD's Advanced Research Projects Agency (ARPA), a world leadership research group has been established, the Center for X-ray Optics (CXRO), which holds the world's record for highest resolution soft x-ray microscopy (300 A); maintains leadership in biomicroscopy and spatially resolved materials studies; produces reflective optics in the soft x-ray and extreme ultraviolet (EUV), which are among the best in the world; participates in an EUV lithography program which will permit the future industrial evolution from visible and ultraviolet microchip patterning to EUV nanochip production; and offers one of the nation's strongest programs for student training in the emerging fields of nanostructures fabrication for materials science, quantum electronics, and biomicroscopy. A recent review article from 'Physics Today' (August 1992), which highlights some of these activities, is attached, along with the most recent annual report submitted to AFOSR, as well as other materials relevant to the AFOSR program. A TECHNIQUE FOR MULTIPLEXING 3X3-COUPLER TERMINATED INTERFEROMETRIC FIBER-OPTIC SENSORS M.S. Thesis
Gregory J. Reid Dec. 1993 108 p
(AD-A276739) Avail: CASI HC A06/MF A02

This thesis investigates the multiplexing of Mach-Zehnder type 3x3 terminated fiber-optic sensors demodulated by either 'quadrature' or 'symmetric' methods using intensity modulation of the source. 3x3-couplers produce signals that permit unmodulated passive demodulation of interferometric signals. The theory is described and the results of a 2x1 element array optical demonstration are presented. Possible architectures using this demultiplexing technique are presented for several applications with different return line requirements. The technique was successfully demonstrated and warrants further investigation to increase the number of sensors and reduce the number of return lines for specific applications. The multiplexing technique presents the opportunity for possible cost savings over other phase generated carrier techniques, which require wavelength modulation of the source and significant optical path differences in the interferometers, and are therefore constrained to presently very expensive sources. The technique presented uses compatible low coherent laser sources such as Compact Disc quality (830 nm) devices. DTIC

OPTICAL FLOW FROM 1D CORRELATION: APPLICATION TO A SIMPLE TIME-TO-CRASH DETECTOR
Tomaso Poggio and Nicola Ancona Oct. 1993 19 p

(Contracts N00014-91-J-1270; N00014-92-J-1879)
(AD-A276777; AIM-1375; CBCL-MEMO-74) Avail: CASI HC A03/MF A01

A new technique exploiting 1D correlation of 2D or even 1D patches between successive frames may be sufficient to compute an estimation of optical flow field. Sparse measurements are used to compute qualitative properties of the flow for different visual tasks. We can combine our technique with a scheme for detecting expansion or rotation in an algorithm which suggests interesting biological implications. The algorithm provides a rough estimate of time-to-crash. It is well-suited for VLSI implementations. It was tested on real image sequences. We show its performance and compare the results to previous approaches. DTIC

POST-CALIBRATION CORRECTION FOR ROTATING-ANALYZER ELLIPSOMETER WITH OPTICAL FIBER BUNDLE DETECTION SYSTEM
S. Y. Kim, L. Spanos, and E. A. Irene 15 Mar. 1994 26 p
(Contract N00014-89-J-1178)
(AD-A277329; TR-64) Avail: CASI HC A03/MF A01

Spectroscopic ellipsometry with a rotating analyzer operated without a dark room is examined. The effect of the residual linear polarization at the output of an optical fiber bundle upon the ellipsometric constants is critically analyzed. The fraction of the linear polarization and the rotation angle of the polarization axis inside the optical fiber are the two key elements of the post-calibration correction. The spectral dependence of the calibration constants is corrected. DTIC

CONTROL AND RELIABILITY OF OPTICAL NETWORKS IN MULTIPROCESSORS
James J. Olsen 22 Dec. 1993 137 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F19628-90-C-0002)
(AD-A277385; TR-985; ESC-TR-93-237) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Optical communication links have great potential to improve the performance of interconnection networks within large parallel multiprocessors, but semiconductor laser drive control and reliability problems inhibit their wide use. This report describes a number of system-level solutions to these problems. The solutions are simple and inexpensive enough to be practical for implementation in the thousands of optical links that might be used in a multiprocessor. Semiconductor laser reliability problems are divided into two classes: transient errors and hard failures. It is found that for transient errors, the computer system might require a very low bit error rate (BER), such as 10(exp -23), without error control. Optical links cannot achieve such rates directly, but a much higher link-level BER (such as 10(exp -7)) would be acceptable with simple error detection coding. A feedback system is proposed that will enable lasers to achieve these error levels even when laser threshold current varies. Instead of conventional techniques using laser output monitors, a software-based feedback system can use BER levels for laser drive control. Experiments demonstrate that this method is feasible and has other benefits such as laser wearout tracking and optical loss compensation. For hard failures, one can provide redundant spare optical links to replace failed ones. Unfortunately, this involves the inclusion of many extra, otherwise unneeded optical links. A new approach, called 'bandwidth fallback,' is presented that allows continued use of partially failed channels while still accepting full-width data inputs, providing high reliability without any spare links. DTIC

SI/SIO2 INTERFACE STUDIES BY IMMERSION ELLIPSOMETRY Technical Report No. 60
Q. Liu and E. A. Irene 15 Mar. 1994 8 p
(Contract N00014-89-J-1178)
(AD-A277277) Avail: CASI HC A02/MF A01

The mechanisms associated with Si/SiO2 interface annealing and thermal oxidation conditions were studied by spectroscopic immersion ellipsometry. Essentially, this surface sensitive ellipsometry technique uses liquids that match the refractive index of the films thereby optically removing the films. With the use of an optical model, it is shown that at high annealing temperatures viscous relaxation dominates, while at low annealing temperatures the suboxide reduction is apparent. It is also shown that with the thickening SiO2 overlayer, the thickness of the suboxide layer at the interface increases and the average radius of the crystalline silicon protrusions decreases for the three different orientation studied. These results are consistent with the commonly accepted Si oxidation model. DTIC

Vertical cavity surface-emitting lasers (VCSEL's) can be integrated with heterojunction phototransistors (HPT's) and heterojunction bipolar transistors (HBT's) on the same wafer to form high speed optical and optoelectronic switches, respectively, that can be optically or electrically addressed. This permits the direct communication and transmission of data between distributed electronic processors through an optical switching network. The experimental demonstration of an integrated optoelectronic HBT/VCSEL switch combining a GaAs/AlGaAs heterojunction bipolar transistor (HBT) with a VCSEL is described below, using the same epilayer structure upon which binary HPT/VCSEL optical switches are also built. The monolithic HBT/VCSEL switch has high current gain, low power dissipation, and a high optical to electrical conversion efficiency. Its modulation has been measured and modeled. DOE

STUDIES OF AN OPTICAL MULTI-PROCESSOR INTERCONNECT Final Report
Jon R. Sauer 1994 179 p
(Contract DASG60-91-C-1043)
(AD-A277093) Avail: CASI HC A09/MF A02

Optical fiber provides a very high capacity medium for point to point transmission of data. It is not a straightforward proposition to achieve the same level of success in networked fiber communication systems. A carefully designed system can approach terabyte-per-second capability. The purpose of this study was to investigate the performance of a generic optical distributed interconnect architecture for parallel processing. In particular, the target was the general purpose, easily programmable, tightly coupled, multiple-instruction stream, multiple data stream (MIMD) systems. We have proposed a fiber-optic interconnect system that is aimed at exploiting the advantages provided by both optics and electronics to provide a low latency, high throughput communication between processors and memory modules in a shared memory system. Decisions taken during any new design are to be based on the basic requirements placed on the system, the strengths and weakness of the implementation domain, and the identification of the problems that exist in past designs. A LOW-COST, CCD SOLID STATE STAR TRACKER Final Report, 1 Dec. 1990 - 30 Nov. 1992
M. Chmielowski and D. Wynne 23 Dec. 1992 529 p
(Contract NAS5-31169; SBIR-09.12-8442)
(NASA-CR-192722; NAS 1.26:192722; R92-204) Avail: CASI HC A23

Applied Research Corporation (ARC) has developed an engineering model of a multi-star CCD-based tracker for space applications requiring radiation hardness, high reliability and low power consumption. The engineering unit compared favorably in functional performance tests to the standard NASA single-star tracker. Characteristics of the ARC star tracker are: field of view = 10 deg x 7.5 deg, sensitivity range of -1 to +5 star magnitude, NEA = 3 in x 3 in, linearity = 5 in x 5 in, and power consumption of 1-3 W (operating mode dependent). The software is upgradable through a remote link. The hardware-limited acquisition rate is 1-5 Hz for stars of +2 to +5 magnitude and 10-30 Hz for -1 to +2 magnitude stars. Mechanical and electrical interfaces are identical to the standard NASA star tracker. Author

MATHEMATICAL NONLINEAR OPTICS Final Technical Report, 1 Apr. 1990 - 1940 Sep. 1993
David W. McLaughlin 3 Jan. 1994 14 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0161-90)
(AD-A277320; AFOSR-94-0062TR) Avail: CASI HC A03

The principal investigator, together with two post-doctoral fellows, several graduate students, and colleagues, has applied the modern mathematical theory of nonlinear waves to problems in nonlinear optics. Projects included the interaction of laser light with nematic liquid crystals, propagation through random nonlinear media, cross polarization instabilities and optical shocks for propagation along nonlinear optical fibers, and the dynamics of bistable optical switches coupled through both diffusion and diffraction. In the first project the extremely strong nonlinear response of a CW laser beam in a nematic liquid crystal medium produced striking undulation and filamentation of the CW beam which was observed experimentally and explained theoretically. In the second project the interaction of randomness with nonlinearity was investigated, as well as an effective randomness due to the simultaneous presence of many nonlinear instabilities. In the polarization problems theoretical hyperbolic structure (instabilities and homoclinic orbits) in the coupled nonlinear Schroedinger (NLS) equations was identified and used to explain cross polarization instabilities in both the focusing and defocusing cases, as well as to describe optical shocking phenomena. For the coupled bistable optical switches, a numerical code was carefully developed in two spatial and one temporal dimensions. The code was used to study the decay of temporal transients to 'on-off' steady states in a geometry which includes forward and backward longitudinal propagation, together with one dimensional transverse coupling of both electromagnetic diffraction and carrier diffusion. PASSIVE, MULTI-CHANNEL FIBER OPTIC ROTARY JOINT ASSEMBLY Patent Application
Gregory Ames, inventor (to Navy) and Roger L. Morency, inventor (to Navy) 8 Nov. 1993 30 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-D016116; US-Patent-Appl-SN-151396; Navy-Case-70935) Avail: CASI HC A03

A passive multi-channel optical fiber rotary joint couples optical fiber communication channels via axially bilaterally symmetrically disposed lens housings, or array pieces, for receiving miniature collimation lenses to one and the other sides of an image-derotation prism-and-prism rotational-drive subassembly including an image derotation prism which rotates at a predetermined ratio of the relative rotation of the array pieces. This establishes transverse pseudo-planar rotary interfaces respectively between the one and another array piece and the confronting sides of the prism-and-prism drive subassembly. Each channel at the axially outward side of each of one and the other array pieces includes a fiber and lens junction in which the fiber is attached to the axially outward side of the collimation lens at (1) a predetermined axially bilaterally symmetrical position chosen for maximum coupling of signal power through the joint, and (2) individual lateral positions relative to the lens chosen to provide coupling with a path of beam propagation perpendicular to the rotary interface at the other side of the collimation lens. METAL-ION SPIN-ON GLASSES: NOVEL MATERIALS FOR ACTIVE WAVEGUIDES
Carol I. H. Ashby, Charles T. Sullivan, G. Allen Vawter, John P. Hohimer, G. Ronald Hadley, and Daniel R. Neal 1993 9 p Presented at the OE/LASE 1994: Conference on Optics, Electro-optics, and Laser Applications in Science and Engineering, Los Angeles, CA, 22-29 Jan. 1994
(Contract DE-AC04-94AL-85000)
(DE94-007738; SAND-93-1785C; CONF-940142-24) Avail: CASI HC A02/MF A01

Monolithic integration of a rare-earth-ion-based active waveguide on the same wafer as its diode pump laser would permit compact packaging of the technology demonstrated in fiber lasers and amplifiers. This new monolithic technology would offer the potential for developing compact infrared and visible (up-conversion) lasers, amplifiers, and other photonic integrated circuit components. One approach that we are investigating for such monolithic integration uses a high concentration of one or more rare-earth ions incorporated into polysiloxane spin-on glasses that are solvent-cast onto 3-5 semiconductor wafers. This 'fiber on a chip' technology substitute a relatively high-ion-concentration, short-length metal-ion spin-on glass (MISOG) waveguide for the low-ion-concentration, long-length fiber. Progress to data on developing MISOG waveguide materials and technology is discussed. DOE

CHARACTERIZATION OF THERMALLY STABLE DYE-DOPED POLYIMIDE BASED ELECTROOPTIC MATERIALS
M. B. Meinhardt, P. A. Cahill, C. H. Seager, A. J. Beuhler, and D. A. Wargowski 1993 9 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC04-94AL-85000)
(DE94-005309; SAND-93-1545C; CONF-931108-78) Avail: Issuing Activity (Department of Energy (DOE))

Polymeric electrooptic materials have the potential to replace electronic switches in applications which require minimization of heat dissipation while maintaining high switching speeds. Polyimide matrices incorporating electrooptic dyes are promising materials for such applications due to their low cost and compatibility with existing processing environments. Preparation and characterization of novel dye-doped polyimide films for electrooptics is described. Thermal stabilities of donor-acceptor 2,5-diaryl oxazoles were evaluated by differential scanning calorimetry. Absorptive losses in thin films of Ultradel 9000D(reg sign) doped with donor-acceptor oxazoles were measured by photothermal deflection spectroscopy. Absorptive losses at high doping levels may be explainable by dye-dye aggregation or dye degradation during the curing process. Lower doping levels, however, show losses of less than or = 3.0 dB/cm at 830 nm and less than or = 2.4 dB/cm at 1,320 nm. DOE

TORQUE-BALANCED EXTENDABLE FIBER OPTIC CABLE Patent Application
Louis E. Sansone, inventor (to Navy) and Gregory Simonds, inventor (to

Navy) 6 Oct. 1993 12 p
(AD-D016097; US-Patent-Appl-SN-134192) Avail: CASI HC A03/MF A01

An extendable fiber optic cable includes an inner tubular core, a viscous gel received in the tubular core, a plurality of optical fibers suspended in the gel, reinforcing fibers which are braided around the inner core, and an elastomeric outer cover which is received over the reinforcing fibers. The cable is first formed in a straight configuration and then formed into a plurality of coiled segments wherein adjacent coiled segments are wound in alternating directions, i.e. clockwise, counterclockwise, clockwise, etc. Straight segments of wire are provided between the coiled segments wherein the cable is stretchable up to 50% of its relaxed length. The alternating coil segments prevent the cable from twisting and transmitting torque forces to the optical fibers. DTIC

N94-32720# Department of the Navy, Washington, DC.
FIBER OPTIC CONTINUOUS TRUE TIME-DELAY MODULATOR Patent Application
Ronald D. Esman, inventor (to Navy) 6 Aug. 1993 21 p
(AD-D016098; US-Patent-Appl-SN-102924) Avail: CASI HC A03/MF A01

The fiber optic true time-delay modulator generates a continuously variable true time-delay (i.e., phase shift) by utilizing the dispersion characteristic of single mode optical fibers. The signal to be variably delayed modulates a continuous wave optical signal from a tunable laser source which is applied to a dispersive optical fiber wherein the phase shift occurs. The optical intensity output of the dispersive optical fiber is converted back into electrical energy by a photodetector for use in radio frequency, microwave and millimeter wave electronic devices. The invention can be used to generate multiple synchronized output signals by using a multiple wavelength laser or by combining outputs from several independently tuned lasers. Also, frequency and phase shifting is inherently provided by modulating the time delay. DTIC

N94-32738# Department of the Navy, Washington, DC.
MULTI-LINE PASSIVE FIBER OPTIC SLIPRING Patent Application
Darrell T. Abney, inventor (to Navy) 30 Sep. 1993 13 p
(AD-D016092; US-Patent-Appl-SN-129725) Avail: CASI HC A03/MF A01

A multi-line, passive fiber optic slipring is provided. A plurality of transmitting optical fibers are terminated in a plurality of focusing lenses. The fibers and focusing lens are free to rotate about an axis rotation. A plurality of ellipsoidal mirrors are stacked on top of one another beneath the focusing lenses such that the axis of rotation passes through a first focal point of each of the plurality of ellipsoidal mirrors. Each of the focusing lenses focuses optical signals through the first focal point of a corresponding one of the ellipsoidal mirrors. The optical signals reflect from each corresponding mirror to a second focal point of the corresponding mirror. Each mirror is further provided with an optical aperture along the axis of rotation to allow the optical signals not focused on the first focal point of the corresponding mirror to pass through. Each of a plurality of receiving optical fibers is fixed at a corresponding one of the second focal points. DTIC

RADIOMETRY SPOT MEASUREMENT SYSTEM
Harry H. Chen and Stephen J. Lawn Apr. 1994 12 p
(RTOP 963-10-0F)
(NASA-TM-106561; E-8727; NAS 1.15:106561) Avail: CASI HC A03/MF A01

The radiometry spot measurement system (RSMS) has been designed for use in the Diffusive And Radiative Transport in Fires (DARTFire) experiment, currently under development at the NASA Lewis Research Center. The RSMS can measure the radiation emitted from a spot of specific size located on the surface of a distant radiation source within a controlled wavelength range. If the spot is located on a blackbody source, its radiation and temperature can be measured directly or indirectly by the RSMS. This report presents computer simulation results used to verify RSMS performance. Author (revised)

LIGHT SCATTERING STUDIES OF A MODEL ELECTRORHEOLOGICAL FLUID
T. C. Halsey (Chicago Univ., IL.) and J. E. Martin 1993 14 p Presented at the 4th International Conference on Electrorhelogical Fluids, Feldkirch, Austria, 20-23 Jul. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC04-94AL-85000)
(DE94-007860; SAND-94-0393C; CONF-9307174-1) Avail: CASI HC A03

Electrorheological suspensions typically contain particles of approximately one (mu)m in diameter. Thus light-scattering offers a natural method of probing the microstructure of these suspensions. We report the development of an index matched single-scattering fluid, as well a slight-scattering studies of this fluid in both a quiescent and sheared regime. In the first case, the results are in agreement with a phenomenological theory of coarsening based on thermal fluctuations. In the second case, they agree with an 'independent droplet' model of the suspensions structure under shear. DOE

SANDIA'S PHOTONIC PROGRAM AND ITS CHANGING NATIONAL ROLE
R. F. Carson and W. J. Meyer 1994 11 p Presented at the OE/LASE 1994: Conference on Optics, Electro-Optics, and Laser Applications in Science and Engineering, Los Angeles, CA, 22-29 Jan. 1994 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC04-94AL-85000)
(DE94-008616; SAND-94-0277C; CONF-940142-29) Avail: CASI HC A03

Photonics activities at Sandia National Laboratories are founded on an extensive materials research program. In 1988, the Compound Semiconductor Research Laboratory (CSRL) was established at Sandia to bring together device and materials research and development, in support of Sandia's role in weapons technologies. Recently, industrial competitiveness has been added as a major mission for the national laboratories. As a result, present photonics programs are not only directed towards internal applications-driven projects, but are increasingly tied to the Department Of Energy's (DOE's) Technology Transfer Initiatives (TTI's), Cooperative Research and Development Agreements (CRADA's), and participation in partnerships and consortia. This evolution yields a full range of photonics programs, ranging from materials synthesis and device fabrication to packaging, test, and subsystem development. This paper presents an overview of Sandia's photonics-program directions, using three applications as examples. DOE

RHIC CHROMATIC CORRECTION SYSTEM
D. Trbojevic, J. Wei, S. Tepikian, S. Peggs, F. Dell, and T. Satogata 1993 5 p Presented at the Orbit Analysis Workshop, Upton, NY, 1-3 Dec. 1993
(Contract DE-AC02-76CH-00016)
(DE94-008532; BNL-49656; CONF-931254-4) Avail: CASI HC A01/MF A01

The chromaticity correction system, including the nonlinear correction, for the Relativistic Heavy Ion Collider (RHIC) is presented. Expected multipoles in the superconducting magnets have shown that the octupole and decapole might be large enough to reduce the momentum aperture and introduce undesirable nonlinear chromatic behavior of the machine. Simulations of these conditions have been performed with the accelerator physics tracking code TEAPOT. The chromatic dependence curves were obtained by the least square fitting. A correction to the first and the second order terms were applied by using two sextupole and two octupole circuits. The decapole correction system was applied to correct for the third order dependence on momentum. The long term tracking studies at injection did not include the decapole correction. The studies showed that the octupole correction system significantly improves the dynamical aperture at the injection. The decapole system would not be necessary at commissioning of the machine but the correction magnets will be available. At the top energy, as to be expected, the low beta quadrupoles are the dominant source of the nonlinear momentum dependence. DOE

The parameters of a silicon - dielectric - metal microstrip line were compared with those of a metal - dielectric - metal microstrip line from an actual FLAPS antenna. The proposed structure has higher losses; this is caused by the electrical conductivity of the illuminated silicon electrode being lower than is the case with a line using a copper top electrode. However, the value of these conductive losses is on the same order as the radiative losses in the microstrip line used in FLAPS antenna. These results point to the feasibility of using the proposed type of a microstrip line in a light-controlled reconfigurable MMW antenna with reasonable energy losses and with a reasonable light flux. A NOVEL OPTOELECTRONIC SYSTEM FOR DISTORTION-INVARIANT ATR Final Report, 2 Jul. 1993 - 2 Jan. 1994
Lev Sadovnik 1 Feb. 1994 32 p
(Contract N00014-93-C-0135)
(AD-A277985; POC-3225) Avail: CASI HC A03/MF A01

The proposed idea is to enhance existing optical correlation based automatic target recognition (ATR) by introducing scale, translation, and rotation invariance (STRI). Previously, STRI was achieved by utilizing a library of matched filters corresponding to various positions of rotation and scale variation. We find that simple preprocessing can eliminate the need for the library since any STR changes in the input image can be nullified by bringing an input image to what we call its archetype. Physical Optics Corporation's (POC's) new approach includes a segmentation preprocessor (required to select any potential object of interest in an image of a realistic scene), POC's invariant preprocessor, and a standard optical correlator. This combination will greatly increase recognition speed and will simplify the recognition training procedure since only one in-plane position of the target will be needed to provide STRI recognition. The Phase 1 research described in this report opened a new approach to invariant ATR in which in-phase object position will no longer be of concern and, therefore, the best matched filter can be exploited to attain maximum confidence of identification. This should result in the development of hardware capable of operating in a real-time mode. DTIC

VISUAL PERCEPTION OF 3-DIMENSIONAL STRUCTURE FROM DIFFERENT TYPES OF OPTICAL DEFORMATION Annual Technical Report, 15 Feb. 1993 - 15 Feb. 1994
James T. Todd 9 Feb. 1994 3 p
(Contract F49620-93-1-0116)
(AD-A278272; AFOSR-94-0222TR) Avail: CASI HC A01/MF A01

The research performed by James Todd during the past year of AFOSR support has examined the abilities of human observers to determine an object's 3-dimensional form from various types of optical information such as shading, texture, motion or binocular disparity, both individually and in combination. The results of this research have provided strong evidence that 3-dimensional structure may be perceptually represented in a manner that is similar to the Klein hierarchy of geometries, such that observers are most sensitive to those aspects of an object's structure that remain invariant over the largest number of possible transformations. The evidence to support this hypothesis has been obtained using a wide variety of converging operations, including judgments of euclidean 3D length, judgments of conformal properties such as 3D angles, and judgments of affine properties such as planarity. We have also examined how these judgments are influenced by combining different types of optical information using both computer simulations and direct viewing of natural scenes. DTIC

STUDIES OF OPTICAL BEAM PHASE CONJUGATION AND ELECTROMAGNETIC SCATTERING PROCESS Final Technical Report, 1 Dec. 1990 - 30 Nov. 1993
Robert W. Hellwarth 30 Mar. 1994 28 p
(Contract F49620-91-C-0018)
(AD-A278389; AFOSR-94-0234TR) Avail: CASI HC A03/MF A01

In this project we have performed both experimental and theoretical studies of optical beam phase-conjugation and of electromagnetic scattering and propagation with intense optical fields. During the reporting period we have: demonstrated that atomic vapors require fewer photons to perform optical wave mixing than any other medium examined to date; showed theoretically that a one-joule broadband optical pulse, whose carrier wavelength is one micron, can impart nearly one GeV energy to a charged particle; established the stringent experimental upper limits on the hyperpolarizabilities of C60 and C70 molecules in solution; made the first direct time-of-flight measurements of the drift velocity of photoexcited carrier in any photorefractive insulator (n-type Bi12SiO20); determined the difference between the complex polarizabilities of different trap levels in insulators; made quantitative predictions and measurements of spatial harmonic content of photorefractive gratings; developed and applied moving-grating diagnostic techniques to photoexcited carriers; and demonstrated an exception to the law of exponential attenuation of weak monochromatic optical beams in a homogeneous medium. Sol-gel optical composites were developed and characterized for potential applications in optics, lasers, nonlinear optics, and optoelectronics. Post-doped xerogels were index matched by in-situ polymerization of monomers to form inorganic-organic composites of low scatter and high optical quality. Characterization of the microstructure was made by visible and IR absorption and Raman Spectroscopy and optical quality by attenuation and scatter measurement. Doping techniques were optimized using hypercritical drying and vacuum impregnation and doping distribution monitored by laser-induced fluorescence. One-tenth wavelength surfaces were formed by novel optical polishing. Organic molecular dopants were

tested in laser and nonlinear systems. Initial third harmonic generation and Z-scan measurements have shown the potential for saturable absorption and optical limiting. DTIC

In this report, we outline the design considerations and construction of an EUV reflection imaging microscope. The parameters of the microscope and the debris measurements of the source are presented. The reasons for selecting a laser-produced plasma (LPP) source and a Schwarzschild objective are described. While most research efforts for the development of soft x ray sources such as soft x ray lasers pursue the generation of shorter and shorter wavelengths down to the 'water window,' the EUV and soft x ray spectral regions are also ideal wavelengths for applications in chemistry and biology due to the photon energy being close to the molecular bond energy. Almost all of the known matter in our universe is in the state of plasma. Because of the complexity of the plasma state, a reliable understanding has to be built on empirical knowledge, since theoretical models easily become misleading unless guided by experiment or observation. Thus, experiments in the laboratory and in situ measurements in space represent an essential, but often overlooked, key to the understanding of our universe. Information learned about the following is addressed: Earth's magnetosphere; classification of cosmic plasmas; electric currents in cosmic plasmas; magnetic field aligned electric fields; anomalous resistivity; magnetic mirror effect; electric double layers; acceleration of charged particles; coupling between magnetic fields and motion of matter; rapid release of magnetically stored energy; filamentary structures; cellular structures; and chemical separation. THE DOUBLE PROBE ELECTRIC FIELD EXPERIMENT ON FREJA: DESCRIPTION AND FIRST RESULTS
G. T. Marklund, L. G. Blomberg, P.-A. Lindqvist, C.-G. Faelthammar, G. Haerendel, F. S. Mozer, A. Pedersen, and P. Tanskanen Oct. 1993 25 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 1103-6613)
(TRITA-ALP-1993-02; ISRN-KTH/ALP/R-93/02-SE; ETN-94-95944) Avail: Issuing Activity (European Space Agency (ESA))

A sophisticated double probe electric field instrument for high resolution measurements of the auroral fine structure was developed for the Freja mission. The instrument is equipped with a 4 Mbyte burst memory for high rate data sampling (6144 samples/s) and for temporary storage of data. It can be run in a number of different operational modes and provides information not only on the vector electric field but also on the satellite potential with a time resolution orders of magnitude better than on previous satellite missions. The plasma environment explored by Freja, that is, the plasma transition region between the upper ionosphere and the innermost magnetosphere, is a highly dynamic region characterized by a considerable degree of spatial and temporal structure on various scales, and is associated with various phenomena such as intense, irregular electric fields, weak double layers, transient electric fields, and low frequency electric field fluctuations. The preliminary results from the first six months of operation clearly demonstrate that the Freja electric field instrument with its burst memory capability and possibility of simultaneous vector electric field and interferometric density measurements is ideally suited for detailed studies of these phenomena. Moreover, the measurements may contribute significantly to the understanding of different aspects of the auroral electrodynamics such as the formation, energy transfer, and current closure mechanisms of different auroral arc structures, and, more generally, of the relationships between auroral electric fields, currents, particles, and optical emissions. RADIATION FROM AN APERTURE INTO AN ANISOTROPIC PLASMA HALF-SPACE Ph.D. Thesis
Suthum Srikasem 1993 132 p
Avail: Univ. Microfilms Order No. DA9322370

The present studies are concerned with the radiation from a given source distribution immersed in an anisotropic plasma. These studies are separated into two parts: radiation in an unbounded plasma and radiation in plasma half-space over a conducting plane. In the first part, the problem is formulated by means of linear analysis, Bessel, and Fourier transform techniques. The integrals of the dyadic Green's function for an anisotropic plasma are evaluated with respect to an orthogonal coordinate system a-caret, b-caret, c-caret. The final solution is expressed in a closed form. This dyadic Green's function can be directly reduced to the case of an uniaxial or an isotropic medium. The rectangular aperture and dipole fields are determined for some specific orientation of the static magnetic field. Conventional image theory is applicable for the cases of isotropic, uniaxial, and anisotropic plasmas. However, in an anisotropic plasma, this theory is only applicable when the static magnetic field is perpendicular to the

conducting plane. In the second part, the image theory is reformulated by using the dyadic Green's function obtained in the first part, the boundary condition on the conducting plane, and the uniqueness theorem. This reformulation technique can be applied to an arbitrary orientation of the static magnetic field. In both parts, the field patterns of the rectangular aperture and dipole in isotropic, uniaxial, and anisotropic plasma are plotted to compare the difference. In an unbounded anisotropic plasma, both extraordinary and ordinary fields will always exist. The value of epsilon(sub 3) (compared to epsilon(sub 1) and epsilon(sub 2)) had the most significant effect on the field patterns. In the second part, for rectangular aperture, the orientation of the static magnetic field had the most significant effect on the extraordinary field pattern. In this case, when the static magnetic field is perpendicular to the conducting plane, then the amplitude of the field patterns are twice as in the case of an unbounded medium.

Recently, additional graphite coverage has been installed in the DIII-D tokamak, increasing the graphite tile coverage from 45% to approximately 90%. Due to a problem with copper impurity bursts during tokamak discharges, copper foam sheets between the graphite tiles and the Inconel wall have been replaced with GRAFOIL gaskets, which further increases the surface area of the graphite inside the DIII-D torus. Although additional graphite has the potential for improving DIII-D performance, if not properly conditioned it can also degrade tokamak discharges by contributing to increased low Z impurity influx and higher particle fueling. To address these concerns, improvements were implemented both in tile preparation and wall conditioning techniques. All previously installed tiles were grit-blasted with boron-carbide grit to remove co-deposited metal impurities and all tiles were outgassed to 1000 C prior to installation. The glow discharge system used for wall conditioning was modified to include a large area electrode. The only conditioning techniques used were baking and helium conditioning to avoid producing loosely bound carbon. Previously, H2 or D2 Taylor discharge cleaning was used extensively during the vent recovery phase. Recovery from the recent 7-month machine opening was extremely rapid with improved modes of energy confinement (H-mode) transitions observed on the 14th plasma discharge. In addition, very high confinement (VH-mode) discharges were obtained without boronization, which is further indication of the rapid vent recovery. Lower recycling/lower fueling efficiency was also observed during operation with all-graphite walls. We will also discuss the use of Ne and Ar glow, and qualification of the new graphite including outgassing tests of the GRAFOIL material.

(DE94-007373; GA-A-21525; CONF-931178-1) Avail: CASI HC A03/MF A01

Experiments on D3-D (and other tokamaks) have shown that improved performance can follow from optimization of the current density profile. Increased confinement of energy and a higher limit on beta have both been found in discharges in which the current density profile is modified through transient means, such as ramping of current or elongation. Peaking of the current distribution to obtain discharges with high internal inductance has been found to be beneficial. Alternatively, discharges with broader profiles, as in the VH-mode or with high beta poloidal, have shown improved performance. Noninductive current drive is a means to access these modes of improved confinement on a steady state basis. Accordingly, experiments on noninductive current drive are underway on the D3-D tokamak using fast waves, electron cyclotron waves. Recent experiments on fast wave current drive have demonstrated the ability to drive up to 180 kA of noninductive current using 1.5 MW of power at 60 MHz, including the contribution from 1 MW of ECCD and the bootstrap current. Higher power rf current drive systems are needed to strongly affect the current profile on D3-D. An upgrade to the FWCD system is underway to increase the total power to 6 MW, using two additional antennas and two new 30 to 120 MHz transmitters. Additionally, a 1 MW prototype ECH system at 110 GHz is being developed (with eventual upgrade to 10 MW). With these systems, noninductive current drive at the 1 MA level will be available for experiments on profile control in D3-D.

TRANSPORT SUPPRESSION BY SHEAR FLOW GENERATION IN MULTIHELICITY RESISTIVE-g TURBULENCE
H. Sugama (National Inst. for Fusion Science, Nagoya, Japan.) and W. Horton Nov. 1993 38 p
(Contract DE-FG05-80ET-53088)
(DE94-007108; DOE/ET-53088/631; IFSR-631) Avail: CASI HC A03/MF A01

Turbulent momentum transport given by the Reynolds stress is considered as one of the candidates explaining the production and sustainment of the mean shear flow in the H-mode plasmas. Here we describe the nature of the shear flow generation and transport reduction in the 3D multihelicity system. The profiles of the Reynolds stress, shear flow and thermal flux in the 3D case are compared with those in the 2D case. The Beklemishev-Horton theory for the anomalous transport which multiplies the 2D transport by the density of distinct mode rational surfaces is found to overestimate the observed flux due to the disappearance of a subset of modes on certain rational surfaces. The mixing-length theory, in which the anomalous transport is independent of the density of mode rational surfaces, underestimates the thermal flux.

(ECL-89-03; ETN-94-95910) Avail: CASI HC A06

The feasibility of a two dimensional computation code for electric arc plasma is addressed. The nonstationary physics of a plasma arc can intervene at high gradients on all the variables, a high convection, as well as the considerable pressure variations (in space and time). Here the spatial finesse needed for the treatment of high gradient zones, is obtained by the use of a finite element method, improved by a mesh auto-adaptivity. The chosen time integration method is of the Runge-Kutta type with time step adjustment. This is presented, with the numerical methodology principles (multimesh, regularization, time step control). Results obtained in the study of classical partial differential equation systems, simplified versions of the Navier-Stokes equations (Burger equation, Dwyer-Sanders flame model), are presented. The numerical treatment of a confined arc plasma required the preliminary definition of a representative system of equations. This system is presented, with the thermal and dynamic modelings carried out.

Different aspects of the models introduced are illustrated, and results obtained for an unstationary one dimensional arc plasma in industrial conditions are presented. Comparisons between these results and available experimental data are encouraging, but suggest that a better dynamic modeling is indispensable. ESA

L-H CONFINEMENT MODE DYNAMICS IN THREE-DIMENSIONAL STATE SPACE
H. Sugama (National Inst. for Fusion Science, Nagoya, Japan.) and W. Horton Jan. 1994 40 p
(Contract DE-FG05-80ET-53088)
(DE94-007113; DOE/ET-53088/639; IFSR-639) Avail: CASI HC A03/MF A01

The dynamical model for the L-H confinement mode transitions consisting of three ordinary differential equations (3-ODE model) for the essential state variables is proposed. The model is derived from the energy balance equations for the resistive pressure-gradient-driven turbulence and describes temporal evolutions of three characteristic variables (u.k.f) the potential energy contained in the pressure gradient, the turbulent kinetic energy and the shear flow energy. The energy input to the peripheral plasma region is included as an external control parameter in the model. The model equations have stationary solutions corresponding to the L and H modes. The authors obtain the L to H and H to L transition with the energy input parameter changed. The type of the L-H transition, whether a first-order or second-order transition, is shown to be determined by the shear flow damping coefficient. They also find the parameter region in which the H mode stationary solution becomes unstable and bifurcates to the limit cycle which shows periodic oscillations characteristic of the ELM confinement state. (DE94-007242; UCRL-JC-115500; CONF-931132-2) Avail: CASI HC A03/MF A01

Ultra-high intensity lasers can be used to ignite ICF capsules with a few tens of kilojoules of light and can lead to high gain with as little as 100 kilojoules of incident laser light. We propose a scheme with three phases. First, a capsule is imploded as in the conventional approach to inertial fusion to assemble a high density fuel configuration. Second, a hole is bored through capsule corona composed of ablated material, pushing critical density close to the high density core of the capsule, by employing the ponderomotive force associated with high intensity laser light. Finally, the fuel is ignited by suprathermal electrons, produced in the high intensity laser plasma interactions, which propagate from critical density to this high density core. This paper reviews two models of energy gain in ICF capsules and explains why ultra-high intensity lasers allow access to the model producing the higher gains. This new scheme also drastically reduces the difficulty of the implosion and thereby allows lower quality fabrication and less stringent beam quality and symmetry requirements from the implosion driver. The difficulty of the fusion scheme is transferred to the technological difficulty of producing the ultra-high-intensity laser and of transporting this energy to the fuel. DOE

STRUCTURAL DESIGN OF THE SUPERCONDUCTING POLOIDAL FIELD COILS FOR THE TOKAMAK PHYSICS EXPERIMENT
T. G. OConnor and J. P. Zbasnik Oct. 1993 6 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contracts W-7405-eng-48; DE-AC02-76CH-03073)
(DE94-007078; UCRL-JC-114266; CONF-931018-84) Avail: CASI HC A02/MF A01

The Tokamak Physics Experiment concept design uses superconducting coils made from cable-in-conduit conductor to accomplish both magnetic confinement and plasma initiation. The Poloidal Field (PF) magnet system is divided into two subsystems, the central solenoid and the outer ring coils, the latter is focus of this paper. The eddy current heating from the pulsed operation is excessive for a case type construction; therefore, a 'no case' design has been chosen. This 'no case' design uses the conductor conduit as the primary structure and the electrical insulation (fiberglass/epoxy wrap) as a structural adhesive. The model integrates electromagnetic analysis and structural analysis into the finite element code ANSYS to solve the problem. PF coil design is assessed by considering a variety of coil current wave forms, corresponding to various operating modes and conditions. The structural analysis shows that the outer ring coils are within the requirements of the fatigue life and fatigue crack growth requirements. The forces produced by the Toroidal Field coils on the PF coils have little effect on the maximum stresses in the PF coils. In addition in an effort to reduce the cost of the coils new elongated PF coils design was proposed which changes the aspect ratio of the outer ring coils to reduce the number of turns in the coils. The compressive stress in the outer ring coils is increased while the tensile stress is decreased. DOE

NUMERICAL METHOD FOR THE INVESTIGATION OF THE MAGNETOHYDRODYNAMIC STABILITY OF THREE DIMENSIONAL PLASMA EQUILIBRIA Ph.D. Thesis [NUMERISCHE VERFAHREN ZUR UNTERSUCHUNG DER MAGNETOHYDRODYNAMISCHEN STABILITAET DREIDIMENSIONALER PLASMAGLEICHGEWICHTE]
Carolin Schwab 1991 168 p In GERMAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-94-95752) Avail: CASI HC A08

A numerical method was developed to treat Magnetohydrodynamic (MHD) stability problems in three dimensional, toroidal plasma configurations. The fundamentals of MHD are presented. The ideal MHD stability problem is formulated as a time independent variational problem. A stability code was developed, and its fundamentals are outlined. The use of the Fourier formalism leads to the concept of mode families. The phase factor transformation was incorporated in the variational problem. The algebraic eigenvalue problem was solved using inverse vector iteration. ESA

STUDIES OF THE PLASMA TRIGGERING MECHANISM OF INVERSE PINCH SWITCH Final Report, 15 Sep. 1989 - 14 Sep. 1993
Kwang S. Han 10 Nov. 1993 26 p
(Contract DAAL03-89-G-0113)
(AD-A276117; ARO-26499.3-PH-SAH) Avail: CASI HC A03/MF A01

The plasma-puff triggering mechanism based on a hypocycloidal pinch geometry was investigated to determine the optimal operating conditions for the azimuthally uniform surface flashover which initiates plasma-puff under wide ranges of fill gas pressure of Ar, He and N2. The optimal fill gas pressure for the azimuthally uniform plasma-puff was about 120 mTorr less than P sub opt less than 450 Torr for He and N2. For Argon 120 mTorr less than P sub opt less than 5 Torr. The inverse pinch switch was triggered with the plasma-puff and the switching capability under various electrical parameters and working gas pressures of Ar. He and N2 was determined. It was also shown that the azimuthally uniform switching discharges were dependent on the type of fill gas and its fill pressure. A new concept of plasma-focus driven plasma-puff was also discussed in comparison with the hypocycloidal pinch plasma-puff triggering. The main discharge of inverse pinch switch with plasma-focus driven plasma-puff trigger is found to be more azimuthally uniform than that with hypocycloidal pinch plasma-puff trigger in a gas pressure region between 80 mTorr and 1 Torr. A comparative study of the INPIStron and a spark gap also reveals that the INPIStron with a low impedance Z = 9 ohms can transfer a high voltage pulse with a superior pulse-shape fidelity over that with a spark of Z = 100 ohms. The effect of boundary conditions on plasma confinement in the reversed field pinch (RFP) was studied. Early theoretical studies of the magnetohydrodynamic stability of the reversed field pinch had shown that the pinch was unstable unless it was surrounded by a conducting shell which prevented the penetration of the magnetic field during the lifetime of the pinch. The presence of the sheer, however, complicated construction

and prevented control of the plasma equilibrium by feedback systems. This research project was undertaken to determine the effect on confinement of varying the magnetic penetration time of the shell. A reversed field pinch, the Reversatron, was constructed so that shells of varying thickness could be installed. Shells were made with magnetic penetration times both longer and shorter than the duration of the plasma discharge. These shells allowed the performance to be determined as a function of the magnetic penetration time of the shell. This research showed that a shell with a short penetration time degraded the discharges. Diagnostic measurements showed reductions in plasma current, discharge duration, and the Doppler temperature of impurity ions and showed increases in the plasma resistivity and loop voltage. The greater power input and lower temperature implied a reduced energy confinement time. Magnetic diagnostics showed that two classes of MHD instabilities with poloidal mode number m = 1 were responsible for the degraded confinement. These were the dynamo modes resonant on the magentic axis (with toroidal mode numbers -9, -10, -11, -12) and the external kink modes (with toroidal mode numbers 3, 4, 5, and 6). DOE

STARK BROADENING OF THE 2S STATE OF HYDROGEN AND DEUTERIUM IN ARC PLASMAS OF LOW DENSITY Ph.D. Thesis [STARKVERBREITERUNG DES 2S-ZUSTANDS VON WASSERSTOFF UND DEUTERIUM IN BOGENPLASMEN NIEDRIGER DICHTE]
Andreas Steiger 1993 87 p In GERMAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-94-95731) Avail: Issuing Activity (European Space Agency (ESA))

The study is focused on the proof of the Stark broadening theory for the first excited state of electrons. The Stark broadening of 2S state of hydrogen and deuterium was measured by two-photons excitation from the fundamental state, for electrons whose number density varies from 3 times 10 to the 21st power to 1.1 times 10 to the 22nd power per cu m, with temperatures in the 7500 to 9000K range. A pulse laser was built for the excitation of the (1S - 2S) transition and a stabilized cascade arc was developed as plasma source, whose parameters were estimated by conventional emission and absorption spectroscopy of Balmer lines. Two-photons excitation was ascertained with nonlinear polarization spectroscopy and a cross polarization extinction power of 100 million was reached during the experiment, so that absorption degrees until 0.0001 could be measured with good reliability. A simple measuring process was obtained with analysis of nonlinear properties of polarization spectroscopy, which suppresses perturbating influences of small error polarizations on the line profile to be measured. An asymmetry of the 1S - 2S Stark profile is detected, which is explained by the fine structure splitting in low density plasmas. ESA

During the past 6 months, experiments have been conducted with the HBT-EP tokamak in order to test and evaluate diagnostic systems, establish basic machine operation, document MHD behavior as a function of global discharge parameters, investigate conditions leading to passive stabilization of MHD instabilities, and quantify the external saddle coil current required for DC mode locking. In addition, the development and installation of new hardware systems has occurred. A prototype saddle coil was installed and tested. A five-position (n,m) = (1,2) external helical saddle coil was attached for mode-locking experiments. And, fabrication of the 32-channel UV tomography and the multipass Thomson scattering diagnostics have begun in preparation for installation later this year. DOE

(DE94-006656; UCRL-JC-114261; CONF-931018-79) Avail: CASI HC A02/MF A01

The design of the local instrumentation and control (I&C) system for the Tokamak Physics Experiment (TPX) superconducting poloidal-field (PF) and toroidal-field (TF) magnets is presented. The local I&C system monitors the status of the magnet systems and initiates the proper control sequences to protect the magnets from any foreseeable fault. Local I&C also stores magnet-system data for analysis and archiving. Quench detection for the TPX magnets must use a minimum of two independent sensing methods and is allowed a detection time of one second. Proposed detection methods include the measurement of normal-zone resistive voltage, cooling-path helium flow, local temperature in the winding pack, and local pressure in the winding pack. Fiber optic based isolation systems are used to remove high common-mode magnet voltages and eliminate ground loops. The data acquisition and fault detection systems are computer based. The design of the local I&C system incorporates redundant, fault tolerant, and/or fail-safe features at all component levels. As part of a quench detection research and development plan, a quench detection model coil has been proposed to test all detection methods. Initial cost estimates and schedule for the local I&C system are presented. DOE

TIME DOMAIN SPECTROSCOPY FOR STUDYING A MONOPOLE ANTENNA IMMERSED IN A PLASMA M.S. Thesis [SPECTROSCOPIE TEMPORELLE POUR L'ETUDE D'UNE ANTENNE MONOPOLE PLONGEE DANS UN PLASMA]
Pierre-Richard Renaud Mar. 1993 325 p In FRENCH
(ISBN-0-315-86526-1; CTN-94-61207) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Time domain spectroscopy (TDS) was applied to study the characteristics of antennas in plasmas. A time domain spectrometer was designed and its operation was tested by analyzing the response of several linear components. The spectrometer measures the complex reflection coefficient as well as the impedance of these loads over the 6-2500 MHz range. TDS results were compared with those found by frequency domain reflectometry (FDR) using a network analyzer. The TDS was then applied to investigating the response of a monopole cylindrical antenna immersed in a cold anisotropic plasma. TDS and FDR yielded results in excellent agreement over the 10-1000 MHz band. Beyond 1000 MHz the precision was negatively affected by the less than ideal short circuit used for calibraiion. The existence of sheath wave resonances below 1000 MHz was confirmed. It was also shown that in the presence of constant magnetic field, the resonances exhibited a shift towards higher frequencies. The effect of the plasma density (discharge current) and of the sheath thickness (controlled by a direct current polarization applied to the antenna) was also studied. The results obtained are in agreement with theory as well as with previously published data. Author (CISTI)

We present measurements of the diverter heat flux in DIII-D for ELMing H-mode and radiative diverter conditions. In previous work, we have examined heat flux profiles in lower single-null diverted plasmas and measured the scaling of the peak heat flux with plasma current and beam power. One problem with those results was our lack of good power accounting. This situation has been improved to better than 80-90% accountability with the installation of new bolometer arrays, and the operation of the entire complement of 5 Infrared (IR) TV cameras using the DAPS (Digitizing Automated Processing System) video processing system for rapid inter-shot data analysis. We also have expanded the scope of our measurements to include a wider variety of plasma shapes (e.g., double-null diverters (DND), long and short single-null diverters (SND), and inside-limited plasmas), as well as more diverse discharge conditions. Double-null discharges are of particular interest because that shape has proven to yield the highest confinement (VH-mode) and beta of all DIII-D plasmas, so any future diverter modifications for DIII-D will have to support DND operation. In addition, the proposed TPX tokamak is being designed for double-null operation, and information on the magnitude and distribution of diverter heat flux is needed to support the engineering effort on that project. So far, we have measured the DND power sharing at the target plates and made preliminary tests of heat flux reduction by gas injection. DOE

DEGENERATE FOUR-WAVE MIXING AS A DIAGNOSTIC OF PLASMA CHEMISTRY
R. N. Zare Mar. 1993 3 p
(Contract DE-FG03-92ER-14304)
(DE94-008588; DOE/ER-14304/1) Avail: CASI HC A01/MF A01

Degenerate four-wave mixing (DFWM) has been found suitable for in situ monitoring during plasma-enhanced chemical vapor deposition. DFWM has been used to monitor CH and C2 during synthesis of diamond thin films. Analysis of CH rotational and vibrational spectra confirmed the temperature trend predicted by the 1-D model. For substrate temperature 1200 K and free-stream temperatures of 3500 and 4300 K, the 1-D simulations predicted boundary layer thicknesses consistent with observations. The species concentration change across the boundary layer is dramatic; at 2 mm from the surface, both CH and C2 reach maximum concentration. It has been demonstrated that, using a conventional laser system, operating at visible wavelengths (low energies), DFWM is nonintrusive and can generate signals that are easily monitored. DOE

STABILITY AND INSTABILITY CRITERIA FOR MAGNETOHYDRODYNAMICS
S. Friedlander (Illinois Univ., Chicago.) and M. M. Vishik (Texas Univ., Austin.) Aug. 1993 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant NSF DMS-91-23946)
(PB94-148475; IHES/P/93/41) Avail: Issuing Activity (National Technical Information Service (NTIS))

The motion of an electrically conducting ideal fluid is governed by the equations of magnetohydrodynamics (MHD) which reduce to the Euler equations in the absence of a magnetic field. Arnold's treatment for the stability of the Euler equations has been extended to the augmented system for ideal MHD by Holm et al (1985) and Friedlander and Vishik (1990). In contrast with the purely hydrodynamic problem, it is possible for MHD to obtain 3-dimensional examples in which the second variation of the energy is in fact definite. We note, however, that it is still a difficult task to check the remaining conditions associated with nonlinear stability concerning convexity and regularity. In this paper, we examine restrictions on the class of examples of MHD equilibria for which the second variation of the energy is definite. We follow the approach of Sadun and Vishik (1993) and consider the Arnold functional corresponding to localized high frequency disturbances. NTIS

The inertial confinement fusion (ICF) pulse rocket is capable of both extremely high specific impulses and high thrust-to-weight ratios by virtue of intermittent nuclear fusion energy production isolated from the vehicle structure. The thruster of the rocket, which converts an initially isotropically expanding ICF debris plasma into a directed pulse jet exhaust, is to be fabricated out of magnetic field created by current coils attached to the vehicle. Thrust is obtained through the property that good conductors exclude magnetic fields. Because of the highly dynamic behavior of the flow, which is bounded by an interface whose motion is unknown a priori, the first problem which must be investigated is that of the bulk flow. Numerical simulations of the bulk flow process were conducted under both the thin-shell and the classical hydrodynamic approximations. In the former approach, all of the plasma is assumed to be collected into an azimuthally symmetric perfectly conducting thin shell at the interface due to interfacial pressure application. These calculations showed that, under idealized conditions, promising propulsive efficiencies could be obtained for a range of field-to-plasma energy ratios and thruster geometries. In the latter approach, the plasma is approximated as an unmagnetized perfectly conducting fluid obeying the laws of classical hydrodynamics. The hydrodynamic codes (both one and two dimensional) employed an advanced classical particle in cell (PIC) scheme, and were successful at capturing interface motions self-consistently. The shock arising from the interface deceleration was also captured correctly. One dimensional planar-geometry simulations gave results which matched well with analytical calculations for such processes as free expansion into a vacuum and shock tube problems. The formation of a shell-like structure originating from the interfacial regions was observed in simulations of large expansion ratio flows carried out in two dimensions, although these 'shells' did not necessarily stay at the interface. The idealized bulk flow analyses in this work are hoped to serve as a basis for more detailed studies of how the flow will behave with a real plasma and to help assess the feasibility and design issues of the device. COLLISIONAL AND CHAOTIC TRANSPORT OF ENERGETIC PARTICLES IN TOROIDAL PLASMA
J. R. Cary and S. G. Shasharina Mar. 1993 182 p
(Contract DE-FG02-85ER-53207)
(DE94-006504; DOE/ER-53207/10) Avail: CASI HC A09/MF A02

Progress is reported in three general areas of confinement plasma physics. First, an accurate theory was developed for the trapping/detrapping process in tokamaks with ripple and stellarators. Second, the alpha particle distribution was determined for the situation where both collisions and collisionless chaotic (ripple) transport are present. Finally, transport of the toroidally trapped particles in rippled tokamaks with up-down asymmetry was studied. DOE

INSTABILITY HEATING OF SOLID-FIBER Z PINCHES Ph.D. Thesis
R. A. Riley, Jr. Feb. 1994 192 p
(Contract W-7405-eng-36)
(DE94-007055; LA-12722-T) Avail: CASI HC A09/MF A02

The Los Alamos High Density Z Pinch-II (HDZP-II) facility is used to study the dynamics of z-pinch plasmas generated from solid fibers of deuterated polyethylene CD(sub 2) with a range in radii of 3-60 microns. HDZP-II is a pulsed-power generator that delivers a current that rises to 700 kA in 100 ns through an inductive load. A multiframe circular schlieren records the evolution of the shape and size of the plasma on seven images taken at 10-ns intervals. These circular-schlieren images show very strong m=0 instability at the onset of current and a rapid radial expansion of the plasma. No higher-order instabilities are observed. An interferometer is used to infer the electron density and electron line density, giving a measure of the fraction of plasma contained within the outline of the circular-schlieren image at one time during the multiframe sequence. A three-channel x-ray crystal-reflection spectrometer provides the time-resolved, spatially-averaged electron temperature. The magnitude of the x-ray emission at these energies also gives qualitative information about the electron temperature and density at late times. A lower bound on the ion temperature is inferred from the particle pressure needed to balance the magnetic field pressure. The ion temperature rose above that of the electrons, strongly suggesting an additional heating term that puts energy directly into the ions. An ion heating term is proposed to explain

the observed rapid radial expansion and elevated ion temperatures. This heating term is based on the assumption that the observed m=0 instabilities reconnect, enclosing magnetic flux which degenerates into turbulence in the plasma. A 0-D simulation is developed to investigate the relevance of different physical models to the data presented. DOE

COMPUTER MODELING OF ACTIVE EXPERIMENTS IN SPACE PLASMAS Ph.D. Thesis
Ross John Bollens 1993 176 p
Avail: Univ. Microfilms Order No. DA9319803

Our understanding of space plasmas is expanding rapidly. This is, in large part, due to the ambitious efforts of scientists from around the world who are performing large scale active experiments in the space plasma surrounding the earth. One such effort was designated the Active Magnetospheric Particle Tracer Explorers (AMPTE) and consisted of a series of plasma releases that were completed during 1984 and 1985. What makes the AMPTE experiments particularly interesting was the occurrence of a dramatic anomaly that was completely unpredicted. During the AMPTE experiment, three satellites traced the solar wind flow into the earth's magnetosphere. One satellite, built by West Germany, released a series of barium and lithium canisters that were detonated and subsequently photoionized via solar radiation, thereby creating an artificial comet. Another satellite, built by Great Britain and in the vicinity during detonation, carried, as did the first satellite, a comprehensive set of magnetic field, particle, and wave instruments. Upon detonation, what was observed by the satellites, as well as by aircraft and ground-based observers, was quite unexpected. The initial deflection of the ion clouds was not in the ambient solar wind's flow direction (V) but rather in the direction transverse to the solar wind and the background magnetic field (V x B). This result was not predicted by any existing theories or simulation models; it is the main subject discussed in this dissertation. A large three dimensional computer simulation was produced to demonstrate that this transverse motion can be explained in terms of a rocket effect. Due to the extreme computer resources utilized in producing this work, the computer methods used to complete the calculation and the visualization techniques used to view the results are also discussed. Dissert. Abstr.

WORKSHOP ON MODELS FOR PLASMA SPECTROSCOPY
30 Sep. 1993 97 p Workshop held in Oxford, England, 27-30 Sep. 1993 Sponsored in part by LLNL Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A276565) Avail: CASI HC A05

A meeting was held at St. Johns College, Oxford from Monday 27th to Thursday 30th of September 1993 to bring together a group of physicists working on computational modelling of plasma spectroscopy. The group came from the UK, France, Israel and the USA. The meeting was organized by myself, Dr. Steven Rose of RAL and Dr. R.W. Lee of LLNL. It was funded by the U.S. European Office of Aerospace Research and Development and by LLNL. The meeting grew out of a wish by a group of core participants to make available to practicing plasma physicists (particularly those engaged in the design and analysis of experiments) sophisticated numerical models of plasma physics. Additional plasma physicists attended the meeting in Oxford by invitation. These were experimentalists and users of plasma physics simulation codes whose input to the meeting was to advise the core group as to what was really needed. DTIC

Fast wave current drive and electron cyclotron current drive experiments have been performed on the D3-D tokamak as part of the advanced tokamak program. The goal of this program is to develop techniques for controlling the profile of the current density in order to access regimes of improved confinement and stability. The experiments on fast wave current drive used a four strap antenna with 900 phasing between straps. A decoupler was used to help maintain the phasing, and feedback control of the plasma position was used to keep the resistive loading constant. RF pickup loops demonstrate that the directivity of the antenna is as expected. Plasma currents up to 0.18 MA were driven by 1.5 MW of fast wave power. Electron cyclotron current drive experiments at 60 GHz have shown 0.1 MA of plasma current driven by 1 MW of power. New fast wave and electron cyclotron heating systems are in development for D3-D, so that the goals of the advanced tokamak program can be carried out. DOE

NEW POLYMER TARGET-SHELL PROPERTIES AND CHARACTERIZATIONS
A. Honig, X. Wei, Q. Fan, N. Alexander, and N. Palmer 1993 6 p Presented at the 9th Target Fabrication Specialists Meeting, Monterey, CA, 6-8 Jul. 1993
(Contract DE-FG03-91SF-18862)
(DE94-008420; DOE/SF-18862/T2-App-A; CONF-9307127-1-App-A) Avail: CASI HC A02/MF A01

A method for characterizing ICF target shells is presented, based on measurement of the gas released from a single shell into a small volume. It utilizes cryogenic permeation systems developed in connection with our work on ICF targets containing nuclear spin-polarized deuterium. Permeation rates for polystyrene and parylene-coated-polystyrene shells are measured at temperatures from 350K down to 180K. Burst or implosion pressure can be determined over a full temperature range down to 20K. Shell temperature is calculated from its gas leakage rate, calibrated by permeation measurements over the temperature range. Lag of shell temperature compared with sample-chamber temperature during warming of the latter is attributed to the weakness of the thermal link provided by both radiative heat transfer and free molecular conduction with small accommodation coefficients for helium and deuterium gas at the structure to which the shell is conductively linked, or at the surface of a conductively isolated shell. Quantification of this lag can provide a measure of atomic scale roughness of the shell outer surface. Also presented are reversible pre-rupture leakage phenomena for polystyrene and parylene-coated-polystyrene shells. DOE

(Contract DE-FG03-90ER-54081)
(DE94-008554; GA-A-21584) Avail: CASI HC A03/MF A01

The pivotal role played by edge physics in tokamak transport and performance is widely appreciated but not completely understood at this time. The evident bifurcation in transport behavior during the L-to-H transition and the modification of the edge region by edge localized modes (ELM's) are just two examples of this relationship. There is a clear need to understand the role that turbulence plays in the plasma transport problem. Various workers have seen a suppression of both the magnetic and plasma density fluctuations during the transition. It is clear that the turbulence and transport behavior are linked and we are coming to an understanding of the transition evolution, based on a model of shear suppression of the turbulence and the creation of a transport barrier. In the case of the H-mode, this barrier is known to form a short distance radially inside the location of the last closed flux surface. The VH-mode may be thought of as a natural extension of this situation where the transport barrier moves deeper into the core of the discharge. As summarized in the May 1989 report of the DOE Transport Task Force, one of the key issues to be addressed in making progress on the transport question was to characterize the nature of local fluctuations. The objective of our research was to develop and demonstrate the feasibility of one particular measurement technique to determine density fluctuations in the region of interest on the DIII-D tokamak. ICRF HEATING AND CURRENT DRIVE IN TFTR SUPERSHOT PLASMAS: DATA ANALYSIS AND INTERPRETATION OF ICRF/EDGE INTERACTIONS

R. E. Aamodt, D. A. Dippolito, and J. R. Myra 22 Sep. 1993 6 p
(Contract DE-FG03-93ER-54212)
(DE94-008586; DOE/ER-54212/1; LRC-93-43) Avail: CASI HC A02/MF A01

The relevance of RF-sheath-plasma interactions to ICRF (ion cyclotron range of frequencies) operation in TFTR (tokamak fusion test reactor) has been studied. Screen-screen and screen-limiter RF sheaths have been identified and analyzed for the old and new Bay M geometries on TFTR, including sheath voltages driven by both feeders and the central antenna conductor. Calculations have been carried out to determine the effects of ICRF on edge transport (profile flattening by E x B convection), impurity influx (delta Z(sub eff)) and edge electron heating (FS glow phenomena) as a function of edge plasma parameters, rf power and antenna phasing. It was found that many of the experimentally observed ICRF-edge plasma interactions on TFIR are consistent with the predictions of RF sheath theory. DOE

EXPERIMENTAL SURVEY OF THE L-H TRANSITION CONDITIONS IN THE D3-D TOKAMAK
T. N. Carlstrom, P. Gohil, and J. C. Watkins Jan. 1994 7 p Presented at the IAEA Meeting on H-Mode Physics, Naka, Japan, 15-17 Nov. 1993
(Contracts DE-AC03-89ER-51114; DE-FG03-89ER-51121; DE-AC02-78ET-51013; DE-AC04-76DP-00789)
(DE94-007428; GA-A-21541; CONF-9311147-6) Avail: CASI HC A02/MF A01

We present the global analysis of a recent survey of the H-mode power threshold in D3-D using D(sup o) yields D(sup +) NBI after boronization of the vacuum vessel. Single parameter scans of B(sub T), I(sub p), density, and plasma shape have been carried out on the D3-D tokamak for neutral beam heated single-null and double-null diverted plasmas. In single-null discharges, the power threshold is found to increase approximately linearly with B(sub T) and n(sub e) but remains independent of I(sub p). In double-null discharges, the power threshold is found to be approximately independent of both B(sub T) and n(sub e). Various shape parameters such as plasma-wall gaps had only a weak effect on the power threshold. Imbalancing the double null configuration resulted in a large increase in the threshold power. DOE

RECENT VH-MODE RESULTS ON D3-D
T. H. Osborne, K. H. Burrell, and T. N. Carlstrom Jan. 1994 6 p Presented at the IAEA Meeting on H-Mode Physics, Naka, Japan, 15-17 Nov. 1993 Prepared in cooperation with California Univ., Los Angeles
(Contracts DE-AC03-89ER-51114; DE-FG03-86ER-53225; W-7405-eng-48; DE-AC05-84OR-21400)
(DE94-007429; GA-A-21554; CONF-9311147-5) Avail: CASI HC A02/MF A01

A regime of improved H-mode energy confinement, VH-mode, is obtained in the D3-D tokamak with adequate vessel conditioning. The improved confinement in VH-mode is consistent with the extension of the region of high E x B velocity shear turbulence suppression zone further in from the plasma boundary. The energy confinement enhancement in VH-mode can be limited by ELM's, localized momentum transfer events, or operation at high heating power or low q. Energy confinement enhancement improves with increasing triangularity of the plasma cross section and is independent of elongation. The termination of VH-mode is associated with an edge localized kink mode which is destabilized by both the large edge pressure gradient and edge current density. DOE

OVERVIEW OF H-MODE STUDIES IN D3-D
R. J. Groebner, D. R Baker,, and S. L. Allen Jan. 1994 10 p Presented at the IAEA Meeting on H-Mode Physics, Naka, Japan, 15-17 Nov. 1993
(Contracts DE-AC03-89ER-51114; DE-FG03-89ER-51121; DE-FG03-86ER-53225; DE-AC05-84OR-21400; DE-AC03-76DP-00789)
(DE94-007430; GA-A-21520; CONF-9311147-4) Avail: CASI HC A02/MF A01

A major portion of the D3-D program includes studies of the L-H transition, of the VH-mode, of particle transport and control and of the power-handling capability of a diverter. Significant progress has been made in all of these areas and the purpose of this paper is to summarize the major results obtained during the last two years. An increased understanding of the origin of improved confinement in H-mode and in VH-mode discharges has been obtained; good impurity control has been achieved in several operating scenarios; studies of helium transport provide encouraging results from the point of view of reactor design; an actively pumped diverter chamber has controlled the density in H-mode discharges; and a radiative diverter is a promising technique for controlling the heat flux from the main plasma. DOE

CHARACTERIZATION OF ATOMIC AND MOLECULAR IMPURITY SOURCES AND TRANSPORT AT THE TOKAMAK EDGE
C. C. Klepper, J. T. Hogan, W. R. Hess, and D. Guilhem 1993 13 p Presented at the 9th Biennial Topical Conference on Atomic Processes in Plasmas, San Antonio, TX, 19-23 Sep. 1993
(Contract DE-AC05-84OR-21400)
(DE94-007212; CONF-9309119-4) Avail: CASI HC A03/MF A01

The characterization of impurity sources in the tokamak edge is challenging because of the highly localized nature of impurity generation. Detailed, spatially resolved, diagnostic information is needed, and three-dimensional (3-D) modeling is required for interpretation. There is also a need for a more extensive atomic and molecular data base for the conditions encountered in this region. The availability of new measurements of photon efficiencies for some relevant hydrocarbon molecules for plasma conditions typical for the tokamak edge and the development of a 3-D Monte Carlo impurities code have enabled the successful modeling of spatially resolved measurements in the vicinity of the pump limiter neutralizer plate and near the inner wall of Tore Supra. ANOMALOUS THERMALIZATION OF FAST IONS IN MAGNETIZED PLASMA
K. R. Chen Nov. 1993 17 p
(Contract DE-FG05-80ET-53088)
(DE94-007109; DOE/ET-53088/634; IFSR-634) Avail: CASI HC A03/MF A01

A novel anomalous process causing the perpendicular energy of fast ions to be thermalized and lost on average to bulk ion heating, instead of classical slowing down and bulk electron heating, is investigated with PIC simulations. More than half of the fast ions are slowed down to the thermal ion level, although some are heated to twice their birth energy. The fast ion density perturbation is large. This process is excited by a new two-gyro-stream instability and may continually occur in a burning plasma. The implications for fusion ignition and fast ion confinement are assessed. DOE

BASIC PRINCIPLES APPROACH FOR STUDYING NONLINEAR ALFVEN WAVE-ALPHA PARTICLE DYNAMICS
H. L. Berk, B. N. Breizman, and M. Pekker Jan. 1994 18 p Presented at the Meeting on Physics of High-Energy Particles in Toroidal Systems, Irvine, CA, 30 Aug. - 1 Sep. 1993
(Contract DE-FG05-80ET-53088)
(DE94-007112; DOE/ET-53088/637; IFSR-637; CONF-930888-1) Avail: CASI HC A03/MF A01

An analytical model and a numerical procedure are presented which give a kinetic nonlinear description of the Alfven-wave instabilities driven by the source of energetic particles in a plasma. The steady-state and bursting nonlinear scenarios predicted by the analytical theory are verified in the test numerical simulation of the bump-on-tail instability. A mathematical similarity between the bump-on-tail problem for plasma waves and the Alfven wave problem gives a guideline for the interpretation of the bursts in the wave energy and fast particle losses observed in the tokamak experiments with neutral beam injection. MAGNETLESS MAGNETIC FUSION
A. D. Beklemishev and T. Tajima Feb. 1994 16 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-FG05-80ET-53088)
(DE94-007114; IFSR-646; DOE/ET-53088/646) Avail: CASI HC A03

The authors propose a concept of thermonuclear fusion reactor in

which the plasma pressure is balanced by direct gas-wall interaction in a high-pressure vessel. The energy confinement is achieved by means of the self-contained toroidal magnetic configuration sustained by an external current drive or charged fusion products. This field structure causes the plasma pressure to decrease toward the inside of the discharge and thus it should be magnetohydrodynamically stable. The maximum size, temperature and density profiles of the reactor are estimated. An important feature of confinement physics is the thin layer of cold gas at the wall and the adjacent transitional region of dense arc-like plasma. The burning condition is determined by the balance between these nonmagnetized layers and the current-carrying plasma. They suggest several questions for future investigation, such as the thermal stability of the transition layer and the possibility of an effective heating and current drive behind the dense edge plasma. The main advantage of this scheme is the absence of strong external magnets and, consequently, potentially cheaper design and lower energy consumption. DOE

MEASUREMENT OF ICF FUEL ION TEMPERATURE ON NOVA
D. B. Harris and R. E. Chrien 1994 7 p Presented at the 11th International Workshop on Laser Interaction and Related Plasma Phenomena, Monterey, CA, 25-29 Oct. 1993
(Contract W-7405-eng-36)
(DE94-006150; LA-UR-94-345; CONF-931048-11) Avail: CASI HC A02/MF A01

A new diagnostic for measuring the average fuel ion temperature in inertial confinement fusion (ICF) targets at the time of peak burn has been constructed by Los Alamos and installed on the Nova Laser System at Lawrence Livermore National Laboratory. This ion-temperature diagnostic measures the time-of-flight of fusion neutrons and determines the thermonuclear-reaction-weighted ion temperature through the time-of-arrival distribution. Preliminary experiments have been designed and performed to test the diagnostic. These tests measured the ion temperature of targets designed to have varying temperatures and yields. Additionally, an experiment has been designed to examine the cause of the increase in yield degradation (compared to clean 1-D calculations) as the capsule convergence is increased. Understanding the cause of yield degradation in high convergence implosions is necessary to increase the confidence of the target performance for the next generation National Ignition Facility planned by the US ICF Program. DIVERTOR PUMPING AND OTHER REACTOR APPLICATION ISSUES FOR H-MODE
R. D. Stambaugh, N. H. Brooks, and S. L. Allen Jan. 1994 8 p Presented at the IAEA Meeting on H-mode Physics, Naka, Japan, 15-17 Nov. 1993
(Contracts DE-AC03-89ER-51114; W-7405-eng-48; DE-AC05-84OR-21400; DE-AC04-76DP-00789; DE-FG03-89ER-51121)
(DE94-007431; GA-A-21542; CONF-9311147-3) Avail: CASI HC A02/MF A01

We summarize results from DIII-D in regard to issues for reactor application of H-mode. Recently, DIII-D has begun to operate a cryopump (D(sub 2) pumping speed = 31,000 ell/s at a pressure of 2 mTorr). Initial results are very favorable for density control in H-mode. The plasma density could be reduced by 50%. Energy confinement is unchanged so the temperature rises in proportion to the density drop. Ability to access these less collisional plasmas in H-mode is favorable to current drive application. With the all-graphite wall, impurity accumulation has been eliminated. The exceedingly good confinement of VH-mode offers the possibility of retaining good confinement while radiating copious power from the plasma edge using injected noble gas impurities. DOE

THE NUMERICAL TOKAMAK PROJECT (NTP) SIMULATION OF TURBULENT TRANSPORT IN THE CORE PLASMA: A GRAND CHALLENGE IN PLASMA PHYSICS
Dec. 1993 37 p
(Contract W-7405-eng-48)
(DE94-008279; UCRL-ID-115962) Avail: CASI HC A03/MF A01

The long-range goal of the Numerical Tokamak Project (NTP) is the reliable prediction of tokamak performance using physics-based numerical tools describing tokamak physics. The NTP is accomplishing the development of the most advanced particle and extended fluid model's on massively parallel processing (MPP) environments as part of a multi-institutional, multi-disciplinary numerical study of tokamak core fluctuations. The NTP is a continuing focus of the Office of Fusion Energy's theory and computation program. Near-term HPCC work concentrates on developing a predictive numerical description of the core plasma transport in tokamaks driven by low-frequency collective fluctuations. This work addresses one of the greatest intellectual challenges to our understanding of the physics of tokamak performance and needs the most advanced computational resources to progress. We are conducting detailed comparisons of kinetic and fluid numerical models of tokamak turbulence. These comparisons are stimulating the improvement of each and the development of hybrid models which embody aspects of both. The combination of emerging massively parallel processing hardware and algorithmic improvements will result in an estimated 10**2--10**6 performance increase. Development of information processing and visualization tools is accelerating our comparison of computational models to one another, to experimental data, and to analytical theory, providing a bootstrap effect in our understanding of the target physics. The measure of success is the degree to which the experimentally observed scaling of fluctuation-driven transport may be predicted numerically. The NTP is advancing the HPCC Initiative through its state-of-the-art computational work. We are pushing the capability of high performance computing through our efforts which are strongly leveraged by OFE support. DOE

STABILITY OF TEARING MODES IN TOKAMAK PLASMAS
C. C. Hegna and J. D. Callen Feb. 1994 35 p
(Contract DE-FG02-86ER-53218)
(DE94-009205; UW-CPTC-94-1) Avail: CASI HC A03/MF A01

The stability properties of m greater than or = 2 tearing instabilities in tokamak plasmas are analyzed. A boundary layer theory is used to find asymptotic solutions to the ideal external kink equation which are used to obtain a simple analytic expression for the tearing instability parameter Delta(prime). This calculation generalizes previous work on this topic by considering more general toroidal equilibria (however, toroidal coupling effects are ignored). Constructions of Delta(prime) are obtained for plasmas with finite beta and for islands that have nonzero width. A simple heuristic estimate is given for the value of the saturated island width when the instability criterion is violated. A connection is made between the calculation of the asymptotic matching parameter in the finite beta and island width case to the nonlinear analog of the Glasser effect. DOE

STABILITY OF BOOTSTRAP CURRENT DRIVEN MAGNETIC ISLANDS IN STELLARATORS
C. C. Hegna and J. D. Callen Mar. 1994 11 p
(Contract DE-FG02-86ER-53218)
(DE94-009207; UW-CPTC-94-3) Avail: CASI HC A03/MF A01

The stability of magnetic island producing perturbations due to fluctuations in the bootstrap current in stellarator configuration is examined. The stability criterion depends on the sign of the derivative of the rotational transform, the pressure gradient and the direction of the equilibrium bootstrap current which is determined by the structure of (parallel)B(parallel). It is found that quasi-helically symmetric stellarator configurations with p'/tau' less than 0 are unstable to the formation of bootstrap current driven magnetic islands. The stability of conventional stellarator configurations depends upon the field structure. DOE

ANALYTIC FORMULATION FOR THE AC ELECTRICAL CONDUCTIVITY IN TWO-TEMPERATURE, STRONGLY COUPLED, OVERDENSE PLASMA: FORTRAN SUBROUTINE
R. Cauble and W. Rozmus 21 Oct. 1993 20 p
(Contract W-7405-eng-48)
(DE94-009466; UCRL-ID-115325) Avail: CASI HC A03/MF A01

A FORTRAN subroutine for the calculation of the ac electrical conductivity in two-temperature, strongly coupled, overdense plasma is presented. The routine is the result of a model calculation based on classical transport theory with application to plasmas created by the interaction of short pulse lasers and solids. The formulation is analytic and the routine is self-contained. DOE

STABILIZATION METHOD OF A.C. ARC PLASMA
M. Iwata, S. Yasui, and M. Shibuya May 1993 26 p
(DE94-757268; CRIE-W-92016) Avail: CASI HC A03/MF A01

A pulse adding method has been discussed in order to stabilize AC plasma. As a first step of discussing the effectiveness of the method, the relation between current gradient at the current zero point and current zero duration was investigated experimentally. The experiment used a plasma torch to generate AC plasma with a current of 200 A and added the pulses of 0 to 30 A to the current zero point. As a result, it was found that, if the current gradient in the pulse added to currents is raised to about 15 A/microsecond against the current zero duration for 10 to 100 microsecond without pulses, the current zero duration is largely reduced to about 0.2 microseconds and the plasma stability is enhanced. A transient analysis calculation revealed a result that, if the current gradient is raised at the current zero point by adding pulses, the current zero duration can be shortened because of rise in the transient recovery voltage. It was also discovered that a polarity change in tungsten electrodes can vary the current zero duration. DOE

ANOMALOUS TRANSPORT EQUATIONS IN TOROIDAL PLASMAS
A. I. Smolyakov (Saskatchewan Univ., Saskatoon.), A. Hirose (Saskatchewan Univ., Saskatoon.), and J. D. Callen Mar. 1994 12 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-FG02-86ER-53218)
(DE94-009206; UW-CPTC-94-2) Avail: Issuing Activity (Department of Energy (DOE))

Reduced transport equations for a toroidal plasma with fluctuations are derived. These equations include the effects of both anomalous and standard neoclassical transport, and allow clarification of the structure of convective fluxes caused by electrostatic and magnetic fluctuations. Special attention is paid to the combined effects of fluctuations and toroidicity on the transport. The formulation retains the effects of a magnetic field inhomogeneity on the anomalous transport. It is shown that phase space diffusion caused by the gradient in the equilibrium magnetic field appears as a pinch flux in the real space. DOE

ELECTRON ACCELERATION SYSTEM Patent
Han S. Uhm, inventor (to Navy) 1 Feb. 1994 6 p Filed 12 Sep. 1991
(AD-D016143; US-Patent-5,283,530; US-Patent-Appl-SN-758978; US-Patent-Class-328-233) Avail: US Patent and Trademark Office

A bore formed within a body of material storing a magnetic field at a saturation level, establishes a linear path along which an electron beam is focussed after the bore is ionized to form a plasma channel therein. The driving current of the beam is sharply decreased to cause simultaneous decay of the stored magnetic field from a saturation level inducing an electric field concentrated in the plasma channel to accelerate travel of trailing electrons in the beam with a high accelerating gradient.

ELECTRON CYCLOTRON RESONANCE PLASMA OXIDATION STUDIES OF InP
Y. Z. Hu, J. Joseph, and E. A. Irene 15 Mar. 1994 29 p
(Contract N00014-89-J-1178)
(AD-A277431; TR-61) Avail: CASI HC A03/MF A01

Electron cyclotron resonance plasma oxidation of InP was studied using both spectroscopic and single wavelength ellipsometry employed during the oxidation process. A two layer oxide was observed with the outer layer being In rich and the inner layer P rich as-confirmed from x-ray photoelectron spectroscopy and etch rate studies. Optical models and oxidation kinetics are analyzed. From positive substrate bias effects on oxidation rates, negative ion oxidant species were identified as dominant and oxide etching was observed at negative bias. DTIC

IONOSPHERIC PLASMA OUTFLOW IN RESPONSE TO TRANSVERSE ION HEATING: SELF-CONSISTENT MACROSCOPIC TREATMENT Annual Progress Report No. 3, 1993 - 1994
N. Singh May 1994 37 p
(Grant NAGw-2903)
(NASA-CR-195820; NAS 1.26:195820; UAH-94-429) Avail: CASI HC A03/MF A01

We examined the various likely processes for creating the cavities and found that the mirror force acting on the transversely heated ions is the most likely mechanism. The pondermotive force causing the wave collapse was found to be a much weaker force than the mirror force on the transversely heated ions observed inside the cavities along with the lower hybrid waves. Using a hydrodynamic model for the polar wind we modeled the cavity formation and found that for the heating rate obtained from the observed waves, the mirror force does create cavities with depletions as observed. Some initial results from this study were published in a recent Geophysical Research Letters and were reported in the Fall AGU meeting in San Francisco. We have continued this investigation using a large-scale semikinetic model. Derived from text

ANALYSIS OF DATA FROM THE PLASMA COMPOSITION EXPERIMENT ON THE INTERNATIONAL SUN-EARTH EXPLORER (ISEE 1) Final Report, 1 Jan. 1990 - 31 May 1994
O. W. Lennartsson 10 May 1994 183 p
(Contract NAS5-33047)
(NASA-CR-195880; NAS 1.26:195880; F-254279) Copyright Avail: CASI HC A09/MF A02

The Lockheed plasma composition experiment on the ISEE 1 spacecraft has provided one of the largest and most varied sets of data on earth's energetic plasma environment, covering both the solar wind, well beyond the bow shock, and the near equatorial magnetosphere to a distance of almost 23 earth radii. This report is an overview of the last four years of data analysis and archiving. The archiving for NSSDC includes most data obtained during the initial 28-months of instrument operation, from early November 1977 through the end of February 1980. The data products are a combination of spectra (mass and energy angle) and velocity moments. A copy of the data user's guide and examples of the data products are attached as appendix A. The data analysis covers three major areas: solar wind ions upstream and downstream of the day side bowshock, especially He(++) ions; terrestrial ions flowing upward from the auroral regions, especially H(+), O(+), and He(+) ions; and ions of both solar and terrestrial origins in the tail plasma sheet and lobe regions. Copies of publications are attached. Author (revised)

CHARACTERISTICS OF ION FLOW IN THE QUIET STATE OF THE INNER PLASMA SHEET
V. Angelopoulos, C. F. Kennel, F. V. Coroniti, R. Pellat, and M. G. Kivelson 15 Mar. 1994 9 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F04701-88-C-0089)
(AD-A277451; TR-93(3940)-7; SMC-TR-94-04) Avail: CASI HC A02

We use AMPTE/IRM and ISEE 2 data to study the properties of the high beta (beta(sub iota) greater than 0.5) plasma sheet, the inner plasma sheet (IPS). Bursty bulk flows (BBF's) are excised from the two databases, and the average flow pattern in the non-BBF (quiet) IPS is constructed. At local midnight this ensemble-average flow is predominantly duskward; closer to the flanks it is mostly earthward. The flow pattern agrees qualitatively with calculations based on the Tsyganenko model (T87), where the earthward flow is due to the ensemble-average cross tail electric field and the duskward flow is the diamagnetic drift due to an inward pressure gradient. The IPS is on the average in pressure equilibrium with the lobes. Because of its large variance the average flow does not represent the instantaneous flow field. Case studies also show that the non-BBF flow is highly irregular and inherently unsteady, a reason why earthward convection can avoid a pressure balance inconsistency with the lobes. The ensemble distribution of velocities is a fundamental observable of the quiet plasma sheet flow field. DTIC

PARTICIPATION IN THE SCIENTIFIC ACTIVITIES OF THE WAVES IN SPACE PLASMA (WISP) PROJECT Final Report, 15 Mar. 1992 - 14 Mar. 1994
Yakov L. Alpert and Mario D. Grossi Apr. 1994 54 p
(Grant NAG5-1925)
(NASA-CR-195903; NAS 1.26:195903) Avail: CASI HC A04/MF A01

This is the Final Report for Contract NAG5-1925, that consisted of experiment design, for possible use by the space science mission called WISP (Waves in Space Plasma). This mission is under study by the Canadian Space Agency and by NASA. Two WISP configurations are contemplated, under the name of BICEPS: one is called BOLAS, and the other WISPRS. Both these configurations are meant to perform bistatic sounding of the ionosphere, at a height close to F(sub 2) H(sub max) (about 350 Km), with a pair of satellites, either tethered or in free flight. Investigation A (with Y.L. Alpert as P.I.) addresses the subject of parametric decay effects, expected to arise in a magnetoplasma under the influence of high-intensity HF fields. Criteria were formulated that could be used in searching for parametric instabilities and of electric fields in the ionosphere and magnetosphere, by in-situ satellites, such as the BICEPS Pair. Investigation B (with M.D.Grossi as P.I.) addressed the bistatic measurement, by the BICEPS pair,of ionospheric features, such as large-scale and small-scale disturbances, travelling ionospheric disturbances, electron density irregularities, spread-F phenomena, etc. These measurements by BICEPS could be correlated with the waveform distortion and degradation experienced by microwave links from geosynchronous height to ground, such as the ACTS satellite, expected to radiate pulses as short as 1 nanosecond in the band 20 to 30 GHz. These links are transionospheric and propagate e.m. waves in the volume of the ionosphere where BICEPS operates. It will be possible, therefore, to correlate the two classes of measurements, and learn the causative mechanisms that are responsible for the time-spread and frequency-spread nature of communications waveforms at microwave, in geosynchronous height to ground paths. TIME RESOLVED MEASUREMENTS OF LIGHT PRODUCED BY ONSET OF PLASMA FORMATION ON ELECTRODES OF FAST PULSED HIGH VOLTAGE DIODES M.S. Thesis
Charles M. Wright 10 Dec. 1993 105 p
(AD-A277974) Avail: CASI HC A06/MF A02

Despite years of research on electrical breakdown of fast pulsed high vacuum diodes, the mechanisms of the process are far from being fully discovered. It is well known that electrical breakdown with plasma formation on the electrode surfaces, but there is disagreement on how this occurs. The most widely accepted model, the Explosive Electron Emission model predicts plasma formation on the cathode by means of ohmic heating caused by a field emitted current. Anode plasma formation under this model is explained as due to energy deposition by fast electrons. A new model proposes that adsorbed neutral molecules on the electrode surfaces play a key role in developing the conditions where unipolar arcs cause plasma formation on both electrodes. In this work, simultaneous measurements of the light produced at the electrodes shows that plasma is produced on the anode in less than 2 nanoseconds after it is produced at the cathode. These findings support the new model. DTIC

INDIUM-VACANCY COMPLEXES IN MERCURY CADMIUM TELLURIDE Final Report, 14 Mar. 1991 - 30 Sep. 1993
M. L. Swanson, William C. Huges, and J. C. Austin 30 Sep. 1993 10 p
(Contract DAAL03-91-G-0080)
(AD-A276177; ARO-27846.8-MS) Avail: CASI HC A02/MF A01

The goals of this research were to study specific defect configurations in Hg(0.79)Cd(0.21)Te (MCT), using perturbed angular correlation (PAC) measurements, with emphasis on the defect consisting of vacancies trapped at the donor impurity indium. The secondary goal was to study antisite defects and small indium precipitates. The first of these objectives was met with the identification and structural characterization of the In-V (Hg) complexes. It was determined that this defect does occur under appropriate conditions (reported in several publications), and that it consists of an indium impurity on a cation site, joined to a single vacancy at the (110) next site. The mysterious (111) orientation of the electric field gradient (EFG) observed for donor-vacancy complexes in MCT and other II-VI semiconductors was shown to result from the polarization of Te atoms surrounding the indium donor. The thermodynamics of the mercury-vacancy and indium-vacancy complexes were extensively characterized, resulting in good estimates of the migration energy for Hg vacancies and binding energies for vacancy-indium pairs. In-V (Hg) complexes were seen to interact with H impurities. No evidence of either antisite defects or small metal clusters was seen at doping levels up to 10(exp 17)In/cu cm. DTIC

Our results indicate that excellent passivation of SiN(x)/GaAs and SiN(x)/InP interfaces can be achieved using both liquid and gaseous sulfur treatments of the surface. It is important to note that the S-treated surfaces are stable in the presence of a 'soft' ECR plasma and are amenable to the environment of SiN(x) growth. Annealing appears to be a crucial step in achieving lower defect densities at the SiN(x)/III-V interfaces. A significant reduction in the interfacial defect density leads to unpinning of the Fermi-level at the interfaces. This permits fabrication of superior metal-semiconductor

(both Schottky and ohmic) junctions and metal-insulator-semiconductor FET's. Furthermore, reduction of defects at the interface also reduces the surface recombination velocity, thus improving the performance of minority carrier based devices. We have demonstrated that such is indeed the case by passivating AlGaAs/GaAs based heterojunction bipolar transistors and surface-emitting lasers. DTIC

La(2-x)Sr(x)CuO4 (0 less than or equal to x less than or equal to 0.15) can all be intercalated with oxygen by a novel electrochemical oxidation method. Bulk superconductivity is found with an onset (T(sub c)) approximately 40 K for the whole range 0.01 less than or equal to x less than or equal to 0.15; for x = 0.25 and 0.33, the electrochemical oxidation did not improve the superconducting properties. The magnetic susceptibility (chi)(T = 50-320 K) data for La2CuO(4.11) and La(1.92)Sr(0.08)CuO(4.07) are nearly identical with those of conventionally prepared La(1.85)Sr(0.15)CuO4, indicating that the hole doping level (p) in the CuO2 planes of the three compounds is nearly the same. Combined thermogravimetric analysis and iodometric titration experiments indicate that part of the intercalated oxygen has a formal valence close to -1. The maximum doped-hole concentration in the CuO2 planes that can be achieved from combined Sr-doping and electrochemical oxygen doping for 0 less than or equal to x less than or equal to 0.15 is p approximately 0.16 holes/formula unit. Oxygen can also intercalate into single crystal La2CuO4 through a slow electrochemical oxidation process. The required low current and long time for the charging process reflects that the oxygen intercalation for a single crystal is limited by its small specific surface area and long diffusion distance. The anisotropic superconducting, magnetic and transport properties are summarized and compared with those of polycrystalline La2CuO(4+(delta)) as well as of YBa2Cu3O(7-delta) and La(2-x)Sr(x)CuO4 single crystals. The single crystal La2CuO(4+(delta)) has a maximum (T(sub c)) approximately 40 K, which is lower than that (T(sub c)) approximately 42-45 of the corresponding polycrystalline samples. The magnetic phase diagram of La(2-x)Sr(x)CuO4 in the antiferromagnetic (AF) regime (0 less than or equal to x less than or equal to 0.02) has been derived from La-139 NQR studies from 4 to 250 K. MODIFICATION OF SEMICONDUCTOR SURFACE PROPERTIES WITH CHEMICALLY BOUND MOLECULAR FILMS Final Report, 15 Jun. 1990 - 15 Dec. 1993
David L. Allara and S. Ashok Feb. 1994 12 p
(Contract DAAL03-92-G-0150)
(AD-A276162; ARO-27770.1-CH) Avail: CASI HC A03/MF A01

In line with the objectives, three parallel and connected thrusts were pursued: (1) investigation of the use of Langmuir-Blodgett (LB) films in MIS Schottky structures to modify the barrier properties of junctions made from SiO2/Si and GaAs(100); (2) the treatment of Si and GaAs(100) surfaces with inorganic P and S compounds in order to favorably modify the electrical behavior, primarily via passivation of surface traps; and (3) the development of self-assembled monolayers of organothiols, in particular, alkanethiolates on GaAs(100) as a means to modify the electrical properties of the surface and more recently as a new class of ultrahigh resolution lithographic resists for nanofabrication. In support of each of these thrusts, extensive work was carried out in two areas: characterization of the structure and composition of the surface films, primarily by infrared spectroscopy (IRS), x-ray photoelectron spectroscopy (XPS) and ellipsometry and characterization of the electrical behavior of the film and its interface with the semiconductor, primarily by fabrication of MIS Schottky diode structures and measurement of I-V and C-V response, but also including limited photoluminescence and photoreflectance measurements. All the work was directed ultimately for the chemically bonded molecular film samples. The LB films represented molecules adsorbed with no chemical bonding, the inorganic treatments represented chemically modified surfaces with molecular groups and the chemically bound inorganic films contained both the previous aspects. ION-BEAM-DRIVEN AMORPHIZATION OF Ca2La8(Si4)6O2 SINGLE CRYSTALS
W. J. Weber, N. J. Hess, and L. M. Wang Nov. 1993 7 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC06-76RL-01830)
(DE94-006219; PNL-SA-22718; CONF-931108-67) Avail: CASI HC A02/MF A01

Single crystals of Ca2La8(SiO4)(sub 6)O2, with 1% Nd substituted for La, were irradiated with 0.8 MeV Ne(+) and 1.5 MeV Kr(+) ions from 15 to 773 K. The irradiations were carried out using the HVEM-Tandem Facility at Argonne National Laboratory. The structural changes and the ion fluence for complete amorphization were determined by in situ transmission electron microscopy. The ion fluence for complete amorphization increased with temperature in two stages associated with defect annealing processes. The critical temperature for amorphization increased from approximately 360 K for 0.8 MeV Ne(+) to approximately 710 K for 1.5 MeV Kr(+). During in situ annealing studies, irradiation-enhanced recrystallization was observed at 923 K. Spatially-resolved fluorescence spectra of the Nd ion excited with 488.0 mn laser excitation showed marked line-broadening toward the center of the amorphous regions. Initial measurements indicate the subtle shifts of the (sup 9)I(sub 9/2) groundstate energy levels can be measured by pumping directly into the excited state (sup 4)F(sub 3/2) manifold suggesting that the line broadening observed originates from a distribution of geometrically distorted Nd sites. During the past two months, we have grown a number of new InGaAs structures and characterized them for sensitivity, speed, resistivity, and optical absorption. We have concentrated on two new approaches that promise to shorten carrier lifetime while maintaining high sensitivity and resistivity. The first approach involves growing a superlattice of

low-temperature molecular beam epitaxy (MBE) InGaAs/InAlAs with post annealing, i.e. InGaAs:As/InAlAs:As. In this structure, the InGaAs:As serves as an absorbing layer while the InAlAs:As serves as a trapping layer. The second approach uses lattice-matched bulk (i.e., no superlattice) InGaAs:As. DTIC

(DE94-608388; JINR-R-14-92-345) Avail: CASI HC A02 (US Sales Only)

Measurements of the muon spin relaxation rate (mu SR) have been performed on monocrystalline unoriented grains YBa2Cu3O(sub 6.89) and ceramics EuBa2Cu3O(sub 6.84) in order to determine the magnetic field penetration depth lambda. Measurements were conducted on field-cooled samples with magnetic field 2.5 kG at temperatures 10 less than T less than 100 K. Experimental value of the muon precession frequency variance (Delta(omega)(sup 2))(sup 1/2)(T yields 0) was approximately equal to 2.5 mu/s, which corresponds to the magnetic field penetration depth perpendicular to CuO2 planes lambda(sub ab)(0) approximately equal to 1600 A. The result calls in question the traditional idea about the penetration depth measured with (mu)SR-experiment lambda(sub (mu)SR) as the lower limit of lambda(lambda greater than or equal to lambda(sub (mu)SR)) in strongly anisotropic high-T(sub c) superconductors. A new member in the tungsten-bronze family of ferroelectric lead potassium niobate (PKN), with general formula Pb(1-x)K(2x)Nb2O6, has been grown as bulk single crystal. Growth of PKN with charge composition x = 0.23 has been achieved using the Czochralski technique of crystal pulling. Large diameter boules were grown in platinum crucibles at temperatures between 1280 and 1300 C. Crystallographic studies were conducted using x ray diffraction techniques. The samples were characterized for ferroelectric properties between 25 and 600 C and for optical absorption. This paper presents the crystal synthesis and the results of ferroelectric and optical characterization. Bulk single crystals of potassium tantalate niobate, KTa(1-x)Nb(x)O3, ferroelectric with different values of Ta/Nb ratios have been grown by temperature gradient transport technique (TGTT). A second attached paper presents the results of the crystal growth experiments, ferroelectric characterization techniques, and properties of potassium tantalate niobate crystals. Derived from text

INCOHERENT IMAGING BY Z-CONTRAST STEM: TOWARDS 1 ANGSTROM RESOLUTION

S. J. Pennycook, D. E. Jesson, and A. J. McGibbon Dec. 1993 9 p Presented at the Fall Meeting of the Materials Research Society, Boston, MA, 29 Nov. - 3 Dec. 1993

(Contract DE-AC05-84OR-21400)

(DE94-006551; CONF-931108-62) Avail: CASI HC A02/MF A01

By averaging phase correlations between scattered electrons, a high angle detector in the scanning transmission electron microscope (STEM) can provide an incoherent, Z-contrast image at atomic resolution. Phase coherence is effectively destroyed through a combination of detector geometry (transverse incoherence) and phonon scattering (longitudinal incoherence). Besides having a higher intrinsic resolution, incoherent imaging offers the possibility of robust reconstruction to higher resolutions, provided that some lower frequency information is present in the image. This should have value for complex materials and regions of complex atomic arrangements such as grain boundaries. Direct resolution of the GaAs sublattice with a 300 kV STEM is demonstrated. DOE

THE THRESHOLD ENERGY FOR DEFECT PRODUCTION IN SiC: A MOLECULAR DYNAMIC STUDY

J. Wong, T. DiazdelaRubia, M. W. Guinan, M. Tobin, J. M. Perlado, A. S. Perez, and J. Sanz 1 Oct. 1993 13 p Presented at the 6th International Conference on Fusion Reactor Materials, Stresa, Italy, 27 Sep. - 1 Oct. 1993

(Contract W-7405-eng-48)

(DE94-007123; UCRL-JC-114789; CONF-930928-28) Avail: CASI HC A03/MF A01

We discuss the results of molecular dynamics computer simulation studies of the threshold energy for defect production in beta-SiC. The simulations are performed with the Tersoff potential for SiC which provides accurate values of many of its defect properties. In addition, we show that it properly describes the melting behavior of SiC. Simulations were carried out for Si and C recoils in 3 dimensional cubic computational cells with periodic boundary conditions and up to 4096 atoms. The results show anisotropy in the threshold for Si and C recoils as well as for the recoil direction. The lowest threshold is 25 eV for C recoils along (111) and the highest is 85 eV for Si recoils along (110). Details of the defect configurations obtained will be discussed. DOE

ION BEAM SYNTHESIS OF IrSi3 BY 1-MeV Ir ION IMPLANTATION INTO Si(111)

T. P. Sjoreen and H.-J. Hinneberg Nov. 1993 6 p Presented at the Fall Meeting of the Materials Research Society, Boston, MA, 29 Nov. - 3 Dec. 1993

(Contract DE-AC05-84OR-21400)

(DE94-006556; CONF-931108-76) Avail: CASI HC A02/MF A01

The formation of a Si/IrSi3/Si heterostructure by 1-MeV Ir ion implantation and subsequent annealing has been studied for different doses (0.1 to 2.25 x 10(exp 17) Ir/sq cm), substrate temperatures (450 to 600 C), and annealing temperatures (1000 to 1200 C) using Rutherford backscattering spectrometry, ion channeling, and cross-sectional transmission electron microscopy. The heterostructure formation is observed to depend strongly on the processing conditions. The best structure, nearly continuous and precipitate-free, is obtained by implanting 1.8 to 2.0 x 10(exp 17) Ir/sq cm at a substrate temperature of 550 C and annealing at 1100 C for 5 hours. A stoichiometric IrSi3 layer can also be produced by furnace annealing at 1150 C for 1 hour or by rapid thermal annealing at 1200 C for 3 minutes. Other substrate temperatures generally lead to a structure with a discontinuous IrSi3 layer frequently interrupted by large surface precipitates or islands. Origin of these islands, as well as dependence of heterostructure on processing parameters, is discussed. DOE

III-V COMPOUND SEMICONDUCTOR STRIP-LOADED WAVEGUIDE DEVICES FOR PICs: DESIGN FOR MINIMUM CROSSTALK AND HIGH DENSITY
G. A. Vawter and G. R. Hadley 1993 7 p Presented at the OE/LASE 1994 Conference on Optics, Electro-Optics, and Laser Applications in Science and Engineering, Los Angeles, CA, 22-29 Jan. 1994
(Contract DE-AC04-94AL-85000)
(DE94-006588; SAND-93-1816C; CONF-940142-18) Avail: CASI HC A02/MF A01

Compact, low-cost photonic integrated circuits (PIC's) have long been a desire of systems engineers. Unfortunately, the majority of PIC's in use today use regrown buried heterostructure waveguides to achieve low crosstalk at reasonable packing density. These regrown structures are very expensive and limit PIC applications to high performance niches. The alternative low-cost approach is to use etched-rib, or strip-loaded, waveguides. Strip-loaded waveguides are simple to manufacture but may have guided slab-modes carrying unwanted light between devices within the PIC. These slab modes can result in very high crosstalk or low device density. This paper addresses techniques for control of stray light in strip-loaded PIC's. Methods include mesa isolation of waveguides and ion implantation outside the waveguide rib. In addition, some devices such as Mach-Zehnder interferometers and waveguide power combiners generate radiation and slab modes as a fundamental means of operation. Improved designs for both of these structures with proper removal of both radiated and slab-mode light and high contrast-ratio operation will be covered. DOE

STUDY OF B(0) - BAR-B(0) MIXING IN D0
S. Igarashi Dec. 1993 10 p Presented at the 9th Workshop on Proton-Antiproton Collider Physics, Tsukuba, Japan, 18-22 Oct. 1993
(Contract DE-AC02-76CH-03000)
(DE94-006000; FNAL/C-93/386-E; CONF-9310247-10) Avail: CASI HC A02/MF A01

The probability of B(sup 0)-(bar B)(sup 0) mixing has been measured using the D0 detector. Non-isolated dimuon events are used to determine the ratio of like to unlike-sign pairs. The measured ratio is 0.48 +/- 0.04(stat.) +/- 0.03(syst.), compared with the expected value of 0.23 +/- 0.07 in the absence of B(sup 0)-(bar B)(sup 0) mixing. The combined mixing probability is measured to be 0.13 +/- 0.02(stat.) +/- 0.05(syst.) in good agreement with other experimental measurements. DOE

ENGINEERING OF DAMAGE IN ION IMPLANTED SILICON Ph.D. Thesis
Jan Reinder Liefting 1992 92 p Sponsored by Netherlands Organization for Scientific Research, and Varian Ion Implant Systems
(ISBN-9-09-005097-3; ETN-94-96028) Copyright Avail: CASI HC A05/MF A01

A study on how secondary defect formation can be influenced by altering implant or anneal conditions and how this affects device performance is presented. Results of engineering the primary damage for low and high mass implants by performing the implants at elevated temperatures are presented. Implanting in this way enhances annealing during the implant and consequently reduces the amount of primary damage. It is investigated if engineering the primary damage in this way influences dislocation formation. TEM (Transmission Electron Microscopy) analysis of implants to doses which generate a total damage much higher than the critical amount is discussed. These implants generate roughly the same total amount of damage, but still dislocation formation should be different and this is studied. It is known that small interstitial clusters, formed during the implant, become stable dislocation loops by absorbing Si interstitials. Thus, dislocation formation could be engineered if alternative sinks for the interstitials could be introduced. It is thought that carbon can act as such a sink. For damage engineering, it is important to know how effective C is as a sink, and this is investigated. Dislocations can severely degrade the yield and quality of microelectronic devices. Several ways to avoid dislocation formation are introduced in a bipolar transistor fabrication process to investigate if device performance may be improved. Defects are considered to have only a negative influence on the quality of Si. This is correct if the defects trap metallic impurities and are positioned in the active regions of a device. A way of engineering the position of dislocations so that the metallic impurities can be placed in regions where they do not influence device performance is achieved. ESA

GaAs/GaN STRAINED LAYER SUPERLATTICE MATERIALS FOR HIGH TEMPERATURE TRANSISTORS, PHASE 1 Final Report, 1 Jul. - Dec. 1992
Jonathan N. Kuznia 10 Jan. 1994 9 p
(Contract DAAL03-92-C-0036)
(AD-A276115; ARO-30481.1-EL-SBI-Phase-1) Avail: CASI HC A02/MF A01

During this program, we were successful in depositing single crystal layers of GaAs on GaAs on GaN epilayers and single crystal GaN on GaAs substrates. These two developments represent an impcrtant advance in the technology base required to grow GaN/GaAs short period superlattices. Due to the large difference in bandgap energy between GaAs and GaN (1.4-3.6 eV), superlattices based on these two materials can potentially provide electronic devices which operate at elevated temperatures over a wide range of wavelengths (365-860 nm). For the first time, tertiary butyl arsine (TBA) was used to grow GaAs on GaN substrates. From an industry safety perspective, this is extremely important since TBA is less toxic and deadly as compared to pure arsine. During this program, the growth of ternary GaAsN was also attempted. Unfortunately, poor results were obtained and further growths were curtailed. During the growth of the ternary GaAsN, an important growth aspect was determined. When attempting to grow GaAsN at low temperatures, arsenic incorporation far exceeded nitrogen leaving the film GaAs. At elevated temperatures, nitrogen was preferentially incorporated leaving a GaN film. Such growth knowledge will prove important for future GaAs/GaN superlattice work. During this program, we were successful in depositing single crystal GaN-GaAs, GaN/GaAs superlattices. DTIC

HIGH PERFORMANCE YBCO FILMS Report, 1 Dec. 1993 - 25 Feb. 1994
Edgar J. Denlinger, Aly Fathy, and David Kalokitis 25 Feb. 1994 9 p
(Contract N00014-91-C-0216; ARPA Order 8100)
(AD-A276493) Avail: CASI HC A02/MF A01

A program plan for Phase 3 of the contract was submitted and approved. It incorporates a silver capping layer and a glass/metal handle for support of a thin YBCO/magnesium fluoride microstrip structure. The basic technology can be applied to MCM's as well as millimeter wave circuit needs. A silver capping layer of thickness 5 microns was found to be compatible with glass and able to withstand processing temperatures of 550 C used for firing and annealing of the glass. However, after subjecting the silver/glass combination to 700 C (to simulate the effect of depositing a subsequent YBCO signal layer in the complete MCM structure), there was some degradation in the silver's conductivity as measured using the dielectric resonator technique. A thicker silver layer is apparently needed to adjust for the interfacial reaction between the silver and the glass. Silver was deposited on both STO and YBCO-covered samples with excellent adhesion. After heating the samples to 750 C in flowing nitrogen, the adhesion of the silver remained excellent when tested with scotch tape. DTIC

HIGH PRESSURE EXPERIMENTS ON THE Y-Ba-Cu-O SUPERCONDUCTORS: A MAJOR ROLE FOR HOLES Ph.D. Thesis
Engelina Nieske vanEenige 1992 143 p Sponsored by Netherlands Organization for Scientific Research
(ETN-94-96013) Avail: CASI HC A07/MF A02

The critical temperature (Tc) of members of the Y-Ba-Cu-O system was investigated as a function of pressure, by means of resistivity measurements. The apparatus used to generate high pressures is a diamond anvil cell. Resistivity measurements were carried out at up to 50 GPa. Y1BaCuO8, a high pressure dependence member, was investigated at up to 17 GPa; the Tc could be increased with 28K, primarily due to the increase of charge carriers in the planes. The Tc as a function of pressure of three '124' samples with a small part of either the Ba or Y atoms replaced by a different kind of atoms was investigated; replacing atoms near the planes with atoms of a different valency is found to decrease the

maximum Tc. High pressure experiments show that Y2Ba4Cu7O15.32, consisting of very thin alternating layers of YBa2Cu3O7 and YBa2Cu4O8, behaves as a multilayer of proximity coupled planes. Measurements of the upper critical field of CaLaBaCu3O7, a tetragonal version of YBa2Cu3O7, showed that the increase of the number of holes with pressure is exceptionally small, and hence the low dTc/dp. Experiments on Bi based conductors showed pressure dependence to fit the general picture. ESA

HYDROGEN INCORPORATION AND RADIATION INDUCED DYNAMICS IN METAL-OXIDE-SILICON STRUCTURES: A STUDY USING NUCLEAR REACTION ANALYSIS Ph.D. Thesis
M. A. Briere 1993 138 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-94-95742) Avail: CASI HC A07

Resonant Nuclear Reaction Analysis (NRA), using the H-1/N-15, alpha gamma/c-12 reaction at 6.4 MeV, is successfully applied to the investigation of hydrogen incorporation and radiation induced migration in metal oxide silicon structures. The influence of processing parameters on the H content of thermal oxides, with and without gate material present, is studied. Hydrogen accumulation at the Si-SiO2 interface is reproducibly demonstrated for as-oxidized samples, as well as for oxides exposed to H2 containing atmospheres during subsequent thermal processing. The migration of hydrogen, from the bulk oxide to the silicon oxide interface during NRA, is investigated. It is found that the cross section for this migration, per incident N-15 ion, depends on the sample processing history. It is argued that the release is due to electron capture at Si-OH sites and that the migration is driven by reductions in the interfacial free energy associated with the incorporation of hydrogen within the strained oxide region. A similar migration of hydrogen during irradiation with 2.5 MeV electrons is presented, which suggests that the migration occurs preferentially under applied fields which are directed to the silicon interface. It is argued that this bias effect is due to holes, which modify the interfacial region so as to increase hydrogen solubility, that is explained by the diffusivity of the hydrogen species during N-15 irradiation, which suggest identification as neutral atomic hydrogen. The spatial distribution of hydrogen at the Si-SiO2 interface is shown to be confined to within ca. 2 nm of the metallurgical boundary, in agreement with measurements of the location of oxide charge states, paramagnetic centers, as well as the width of the strained transition region in the neighborhood of this interface. A direct correlation between the hydrogen content of the bulk oxide and the radiation generated oxide charges and interface states is presented. These data provide strong support for the important role of hydrogen in determining the radiation sensitivity of electronic devices. ESA

ELECTRON SPIN RESONANCE MEASUREMENTS OF Er(3+) AND Mn(2+) IN THE HIGH TEMPERATURE SUPERCONDUCTOR COMPOUNDS La(2-x)Sr(x)CuO(4-DELTA) Ph.D. Thesis
[ELEKTRONENSPINRESONANZ-MESSUNGEN AN ER(3+) UND MN(2+) IN DEN HOCHTEMPERATUR-SUPRALEITER-VERBINDUNGEN LA(2-X)SR(X)CUO(4-DELTA)]
Lei Kan 1992 91 p In GERMAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-94-95746) Avail: Issuing Activity (European Space Agency (ESA))

The Electron Spin Resonance (ESR) of the magnetic doping impurities of Er(3+) and Mn(2+) in the high temperature superconductor compound La(2-x)Sr(x)CuO(4-delta) was investigated for a large variation of x and the Mn concentration. Besides ESR, the magnetic susceptibility and the electrical resistance were also measured to determine spin dynamics, and magnetic and electrical properties of the lanthanum compounds. The spin dynamics was described by a theoretical model. The ESR studies provides very interesting information about the spin dynamics of the Cu and Mn ions in the lanthanum compounds. The strong coupling between the magnetic moments of these ions (bottleneck domain) strongly reduces the broadening of the Mn(2+) ESR linewidth. The ESR measurements allow the study of the relaxation rates of the Cu spin system and other degrees of freedom. The Mn(2+) ESR signal could not be observed in the superconducting state since the transition temperature of the compounds is strongly reduced by the doping with Mn ions. ESA

IMPURITIES AND CONDUCTIVITY IN A D-WAVE SUPERCONDUCTOR
A. V. Balatsky 1994 7 p Presented at the Strongly Correlated Electron Materials, Los Alamos, NM, 15-18 Dec. 1993
(Contract W-7405-eng-36)
(DE94-006222; LA-UR-94-96; CONF-931247-3) Avail: CASI HC A02/MF A01

Impurity scattering in the unitary limit produces low energy quasiparticles with anisotropic spectrum in a two-dimensional d-wave superconductor. The authors describe a new quasi-one-dimensional limit of the quasiparticle scattering, which might occur in a superconductor with short coherence length and with finite impurity potential range. The DC conductivity in a d-wave superconductor is predicted to be proportional to the normal state scattering rate and is impurity-dependent. They show that quasi-one-dimensional regime might occur in high-(Tc) superconductors with Zn impurities at low temperatures T approximately less than 10 K. DOE

CHARACTERIZATION OF THE RARE EARTH ORTHOPHOSPHATES AND Ce-DOPED LaPO4 BY X RAY ABSORPTION SPECTROSCOPY
D. K. Shuh (California Univ., Berkeley. Lawrence Berkeley Lab.), D. Perry (California Univ., Berkeley. Lawrence Berkeley Lab.), L. J. Terminello (Lawrence Livermore National Lab., CA.), L. A. Boatner, and M. M. Abraham 1993 6 p Presented at the Fall Meeting of the Materials Research Society, Boston, MA, 29 Nov. - 3 Dec. 1993
(Contracts DE-AC05-84OR-21400; DE-AC03-76SF-00098; W-7405-eng-48)
(DE94-006313; CONF-931108-73) Avail: CASI HC A02/MF A01

X-ray Absorption Spectroscopy (XAS) of the Rare Earth (RE) 3d levels yields sharp peaks near the edges as a result of strong, quasi-atomic 3d(sup 10)4f (yields) 3d(sup 9)4f(sup n+1) (M(sub 4,5)) transitions that contain a wealth of spectroscopic features. XAS is a useful technique for the characterization of 4f-occupancy, 4f-hybridization, and valence in RE-containing materials. The XAS measurements of the single crystal RE-orthophosphates, as well as a range of Ce doped (approximately 1-30%) LaPO4 hosts were performed at the 3d edge in the total electron yield mode at beamline 8-2 at the Stanford Synchrotron Radiation Laboratory (SSRL). The XAS spectra of the RE ions in the orthophosphate matrix generally resemble that of the corresponding RE metal and emphasize the major contribution of the trivalent state to the electronic transitions occurring at the 3d edge. There is no energy shift of the La and Ce absorption peaks with Ce doping and furthermore, no additional transitions are observed in either spectral region. However, accompanying the Ce doping there is a significant narrowing of the La absorption peak full width half maximum that contrasts to the Ce features that exhibit no contraction. The La and Ce spectra indicate that the Ce-doping of LaPO4 is purely substitutional. DOE

THE 4f HEAVY FERMION PHOTOELECTRON SPECTRA DO NOT EXHIBIT THE KONDO SCALE
A. J. Arko, J. J. Joyce, A. B. Andrews, R. I. R. Blyth, R. J. Bartlett, Z. Fisk, P. C. Canfield, C. G. Olson, P. J. Benning, and D. M. Poirier et al 1994 8 p Presented at the Strongly Correlated Electron Materials, Los Alamos, NM, 15-18 Dec. 1993
(Contract W-7405-eng-36)
(DE94-006252; LA-UR-94-217; CONF-931247-1) Avail: CASI HC A02/MF A01

It has been the authors contention for some time that neither the Single Impurity Anderson Model (SIAM), as extended by Gunnarsson and Schonhammer (GS), or the non-crossing approximation (NCA) correctly describes the 4f photoelectron spectra of heavy fermions. Recently, they have concentrated on Yb heavy fermions since in these materials the Kondo resonance (KR) is fully occupied and thus accessible via photoemission. In particular, they have repeatedly pointed out that the width, position, spectral weight, lineshape, and temperature dependence of the features assumed to be the KR and its sidebands, are nearly independent of the Kondo temperature, T(sub K), while at the same time bearing a striking resemblance to the simple 4f core level spectra of pure Yb metal, or of Lu in isostructural Lu compounds. It is important to resolve these issues in view of the fundamental nature of the problem. Here, the authors chose to test the bulk vs. surface hypothesis by performing measurements on YbCu2Si2 and YbAl3 single crystals at hv approximately 120 eV (UPS)

and hv approximately 1,500 eV(XPS) to see if the n(sub f), hole occupancy, values increase markedly at XPS energies as the electron escape depth increases by about a factor of 3-5. Measurements were performed at both 300K and 20K using single crystals cleaved in-situ, with photoelectrons collected in normal emission for maximum bulk sensitivity. UPS measurements were performed at NSLS and the University of Wisconsin SRC, while XPS measurements were done at the University of Minnesota. The UPS, ultraviolet photoelectron spectra, and the L(sub 3) edge x-ray absorption and photoemission measurements are in fundamental disagreement. DOE

EXPERIMENTAL EVIDENCE FOR LATTICE EFFECTS IN HIGH TEMPERATURE SUPERCONDUCTORS
S. J. L. Billinge, G. H. Kwei, and J. D. Thompson 18 Jan. 1994 51 p Presented at the Strongly Correlated Electron Materials, Los Alamos, NM, 15-18 Dec. 1993
(Contract W-7405-eng-36)
(DE94-006250; LA-UR-94-0277; CONF-931247-4) Avail: CASI HC A04/MF A01

We present an overview of the experimental evidence for the role of the lattice in the mechanism of high temperature superconductivity. It appears unlikely that a solely conventional electron-phonon interaction produces the pairing. However, there is ample evidence of strong electron and spin to lattice coupling and observations of a response of the lattice to the electronic state. We draw attention to the importance of the local structure in discussions of lattice effects in high-T(sub c) superconductivity. DOE

PHOTONIC BANDGAPS IN PERIODIC DIELECTRIC STRUCTURES Ph.D. Thesis
Pierre R. Villeneuve Dec. 1993 124 p
(ISBN-0-315-86902-X; CTN-94-61236) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Photonic bandgaps are defined as frequency intervals for which electromagnetic wave propagation is forbidden in all 4 pi steradians within a dielectric structure with a periodic index of refraction. Since photonic bandgap materials can essentially suppress all states, the radiative dynamics within the materials can be strongly modified. By changing the atom-field radiative coupling, photonic bandgap materials could lead to the inhibition of spontaneous emission; if a local defect is introduced within the structure, it will behave like a high Q microcavity. The existence of bandgaps can be predicted from a strictly classical treatment of the vector wave equation. The numerical results depend on the formulation of the problem. Use of the plane-wave expansion can lead to accurate results but introduces two problems related to the dielectric discontinuities and the plane-wave cutoff. The rate of convergence is compared as a function of the number of expansion terms and an alternative is presented to the discontinuous step function representation of the dielectric structure. These functions will allow overcoming of the Gibbs phenomenon and eliminate spatial fluctuations of the dielectric function. Guidelines are given for generation of photonic bandgaps. Experiments at microwave frequencies demonstrate many of the properties of photonic bandgaps. Author (CISTI)

RESEARCH ON THE STABILITY, ELECTRONIC PROPERTIES, AND STRUCTURE OF a-Si:H AND ITS ALLOYS
W. B. Jackson, N. Johnson, and N. Nickel Feb. 1994 53 p Prepared for Midwest Research Inst., Golden, CO Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC02-83CH-10093)
(DE94-000292; NREL/TP-451-6192) Avail: Issuing Activity (Department of Energy (DOE))

This report describes work focusing on the defect and transport properties of a-Si:H with particular emphasis on defect metastability. Light-induced defects remain the major impediment to higher stabilized solar cell efficiencies. The many years of research have shown that this is a difficult problem to solve, and we take the view that a solution can be found only with a deep understanding of the mechanism; this has been our main goal. The metastability is closely related to the intrinsic defect properties, so these studies have also led to a greatly improved model of all the electronic properties of a-Si:H. Section A of the report discusses a theoretical analysis of the defect pool model for the equilibrium dark defect density, with particular reference to whether there are significant charged defects. Section B discusses the use of an electronic transport model to analyze forward and reverse currents and extends it to the calculation of field dependences of bulk and contact currents, which give more precision to the analysis of defects from reverse bias thermal generation currents. Electronic transport is discussed in Section C. Work done on H transport and bonding is described in Section D. DOE

INORGANIC MATERIALS FOR ANOMALOUS-DISPERSION PHASE-MATCHED SECOND HARMONIC GENERATION: RUBIDIUM TITANYL ARSENATE ISOMORPHS, Rb(Ti(1-2x)Ln(x)Nb(x) OAsO4
M. T. Anderson, M. L. F. Phillips, and G. D. Stucky 1993 26 p Presented at the 1st Meeting of the Pacific Rim Ceramic Societies, Honolulu, HI, 7-10 Nov. 1993
(Contract DE-AC04-94AL-85000)
(DE94-006141; SAND-93-2743C; CONF-931142-6) Avail: CASI HC A03/MF A01

We report the synthesis and optical properties of Rb(Ti(1-2x)-Ln(x)Nb(x))OAsO4. The solid solubility of lanthanide ions in the materials decreases exponentially as the size of the lanthanide ion increases. The materials exhibit absorption spectra characteristic of the particular lanthanide ion in the structure. The spectral regions between absorption peaks are transparent and will allow the transmission of fundamental and second-harmonic radiation. The charge transfer band is red-shifted 0 to 27 nm relative to RbTiOAsO4 (midpoint 331 nm). Second-harmonic intensities measured at 532 nm decrease exponentially as lanthanide ion concentration increases. DOE

FERMI SURFACE INSTABILITY AT 0.4 K IN A HEAVY-FERMION YbBiPt: SDW?
R. Movshovich, A. Lacerda, P. C. Canfield, J. D. Thompson, and Z. Fisk 1994 7 p Presented at the Strongly Correlated Electron Materials, Los Alamos, NM, 15-18 Dec. 1993
(Contract W-7405-eng-36)
(DE94-006224; LA-UR-94-73; CONF-931247-2) Avail: CASI HC A02/MF A01

The authors report results of resistivity measurements of heavy-fermion compound YbBiPt at ambient and hydrostatic pressures of up to approximately 6 kbars and in magnetic field up to 1 Tesla. They interpret the rise of resistivity below 0.4 K as partial gaping of the Fermi surface. From the temperature dependence of resistivity they obtain the value of the weak coupling energy gap of delta(sub 0)/k(sub B)T(sub c) = 1.65 (+-) 0.15. Magnetic field -- transition temperature phase diagram follows the weak coupling BCS expression remarkably well from T(sub c) to T(sub c)/4. These results support identification of 0.4 K transition as a Spin Density Wave formation. DOE

[DEVELOPMENT OF SAMPLE CHARGE COMPENSATION FOR CHARACTERIZATION OF IMPURITIES IN SEMICONDUCTOR MATERIALS]

Floyd D. McDaniel 2 Feb. 1994 14 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-90-J-1691)
(AD-A277113) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Because of the high sensitivities and small sample size capabilities, an accelerator mass spectrometry (AMS) system has been constructed at the Ion Beam Modification and Analysis Laboratory (IBMAL) at the University of North Texas. The AMS system, which has been developed through a collaboration with Texas Instruments Inc., the National Science Foundation, and the Office of Naval Research, has been applied to trace element analysis of stable isotopes in electronic materials. The terminal charge stripping inherent with tandem accelerator operation allows molecular interferences to be removed. The interferences of molecules that have approximately the same mass as the element of interest (e.g. (Si-28)2 and Fe-56) are one of the primary limits to high sensitivities for SIMS. Because AMS has increased sensitivities over SIMS for some elements by factors of 100 to 1000 due to the removal of molecular interferences, AMS is sometimes called 'Super-SIMS.' The unique capabilities of AMS allow new and more sensitive methods for the characterization of trace impurities in electronic materials. DTIC

EPITAXIAL LIFTOFF TECHNOLOGY ONTO PROCESSED SILICON FOUNDRY WAFERS Annual Report, FY-1993
Eli Yablonovitch 1993 2 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-93-1-0311)
(AD-A277116) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Technical objectives are to research the application of liftoff transfer of epitaxial material to foreign substrates including: surface chemistry and electrical, mechanical, thermal, and optical properties of Van der Waals bonded materials; III-V devices bonded to silicon circuitry and to other substrates with enhanced optical, electrical, or thermal properties; and integrated optical devices incorporating lifted-off material and/or devices with LiNbO3 glass or other substrates. This effort addresses the need for new technologies which can fully utilize the performance advantages of III-V (GaAs, InGaAs, InGaAsP, and InP) materials for electronic and optoelectronic applications. Specifically, the program is directed at demonstrating the potential of epitaxial liftoff as a technology to enable the realization of 'monolithic' optoelectronic devices with the characteristics of epitaxial material, that is, by transfer of epitaxial material to foreign substrates in a form that permits material processing and device fabrication to proceed as though the epitaxial material were grown directly on the substrate. TETRAALKYLDIARSINES AS POTENTIAL PRECURSORS FOR ELECTRONIC MATERIALS: SYNTHESIS AND CHARACTERIZATION OF VARIOUS ISO-PROPYL ARSENIC COMPOUNDS Interim Technical Report No. 4, 1 Jul. 1992 - 1 Mar. 1994
Lawrence F. Brough, Liu Gang, Matthew A. Lipkovich, and Thomas J. Colacot 8 Mar. 1994 9 p
(Contract N00014-92-J-1828)
(AD-A277003) Avail: CASI HC A02/MF A01

Tetrakis (iso-propyl) diarsine was synthesized by the reaction of (i-Pr)AsLi with (i-Pr)2AsI. The lithium salt of the secondary arsine was produced following deprotonation of (i-Pr)2AsH, obtained by reduction of (i-Pr)2AsI, which was prepared by the thermolysis of (i-Pr)3AsI2. The X-ray crystal structure of (I-Pr)3AsII has been determined on the product of the reaction of (i-Pr)3As and I2. Compounds of the general form E= As(i-Pr), (E = O, S, Se) have been prepared. DTIC

NEW MOLECULAR-BASED ROUTES TO BINARY MAIN GROUP METAL SULFIDES Interim Technical Report No. 1, 1 Jul. 1992 - 1 Mar. 1994
William S. Rees, Jr. and Gertrud Kraeuter 8 Mar. 1994 14 p
(Contract N00014-92-J-1828)
(AD-A277005) Avail: CASI HC A03/MF A01

Metal thiolates of the general formula M(SR)2 (M = Pb, Zn, Cd) and Cl-Hg-SR (R = alkyl) have been prepared and characterized by IR and NMR spectroscopic techniques, TGA and, in selected cases, single crystal X-ray diffraction. The metal bis(thiolate) compounds can be converted into the related metal sulfides by thermolyses. The solid state materials have been characterized by XRPD, SEM and, in selected cases, by particle size determination. The volatile pyrolytic co-products have been isolated and characterized by GC/MS. The decomposition pathways of mercury chlorothiolates are more complicated and depend on the nature of the organic group present in Cl-Hg-SR. DTIC

THE CHARGING EFFECT IN HIGH-Tc SUPERCONDUCTING THIN FILMS Final Report, 1 Nov. 1991 - 31 Dec. 1993
Roman Sobolewski Jan. 1994 12 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F49620-92-J-0075)
(AD-A277265; AFOSR-94-0058TR) Avail: CASI HC A03

Experimental research has been conducted to elucidate the basic physics and possible applications of the charging effect in partially oxygen-depleted YBa2Cu3O(6+x) (YBCO) thin films. A novel laser-writing technique, suitable for patterning and fabrication of monolithic YBCO electronic devices has been developed. The technique allows us to define superconducting and insulating regions in the same sample and is based on local laser beam heating of the epitaxial YBCO film in either the presence or the absence of an oxygen atmosphere. Several test structures for our charging-effect experiments were fabricated using laser writing. The structures are fully monolithic with a partially oxygen-depleted channel and oxygen-rich source and drain electrodes. The devices were tested and showed a substantial charging effect, which we associate with the charge-transfer effects related to electric-field-enhanced changes of the crystalline order in oxygen-deficient YBCO. We have also fabricated and successfully tested laser-written YBCO microwave transmission structures and resonators. The developed devices represent a new approach for the high-temperature superconducting electronics, which consists of exploiting contrasting properties of the oxygen-poor and oxygen-rich YBCO phases to design novel devices. ANOMALOUS SMALL ANGLE X RAY SCATTERING STUDIES OF AMORPHOUS METAL-GERMANIUM ALLOYS Ph.D. Thesis
M. Rice Dec. 1993 197 p

(Contract DE-AC03-76SF-00515)
(DE94-007258; SU-SLAC-434; SU-SLAC/SSRL-0065) Avail: CASI HC A09/MF A03

This dissertation addresses the issue of composition modulation in sputtered amorphous metal-germanium thin films with the aim of understanding the intermediate range structure of these films as a function of composition. The investigative tool used in this work is anomalous small-angle x-ray scattering (ASAXS). The primary focus of this investigation is the amorphous iron-germanium (a-Fe(x)Ge(100-x)) system with particular emphasis on the semiconductor-rich regime. Brief excursions are made into the amorphous tungsten-germanium (a-W(x)Ge(100-x)) and the amorphous molybdenum-germanium (a-Mo(x)Ge(100-x)) systems. All three systems exhibit an amorphous structure over a broad composition range extending from pure amorphous germanium to approximately 70 atomic percent metal when prepared as sputtered films. Across this composition range the structures change from the open, covalently bonded, tetrahedral network of pure a-Ge to densely packed metals. The structural changes are accompanied by a semiconductor-metal transition in all three systems as well as a ferromagnetic transition in the a-Fe(x)Ge(100-x) system and a superconducting transition in the a-Mo(x)Ge(100-x) system. A long standing question, particularly in the a-Fe(x)Ge(100-x) and the a-Mo(x)Ge(100-x) systems, has been whether the structural changes (and therefore the accompanying electrical and magnetic transitions) are accomplished by homogeneous alloy formation or phase separation. The application of ASAXS to this problem proves unambiguously that fine scale composition modulations, as distinct from the simple density fluctuations that arise from cracks and voids, are present in the a-Fe(x)Ge(100-x), a-W(x)Ge(100-x), and a-Mo(x)Ge(100-x) systems in the semiconductor-metal transition region. Furthermore, ASAXS shows that germanium is distributed uniformly throughout each sample in the x less than 25 regime of all three systems. DOE

CORRELATIONS BETWEEN MICROMAGNETIC, MICROSTRUCTURAL AND MICROCHEMICAL PROPERTIES IN ULTRATHIN EPITAXIAL MAGNETIC STRUCTURES Annual Report No. 1, 1 Jan. - 31 Dec. 1993
M. R. Scheinfein, J. S. Drucker, and G. G. Hembree 31 Dec. 1993 132 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-93-1-0099)
(AD-A277200) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The proposed goal of this project is to obtain quantitative measurements of the microstructural, microchemical and micromagnetic properties of surfaces and interfaces of ultrathin films composed of magnetic materials deposited on non-magnetic, antiferromagnetic (metal) and insulating substrates. Surface microanalytic methods based on unique ultrahigh-vacuum scanning transmission electron microscope/scanning electron microscope (UHV-STEM/SEM) equipped with in-situ thin film preparation and characterization tools are being used. Magnetic characterization is performed in-situ using the surface magneto-optical Kerr effect (SMOKE). Additional magnetic microstructure measurements are being conducted in a novel STEM based electron holography system where absolutely calibrated nanometer resolution magnetometry is possible. Of the proposed systems for study outlined in the original proposal, work has begun on FE/Ag, Fe/Cu, Fe/CaF2 and Fe/CaF2/Si (half of the proposed systems). DTIC

The semiconducting crystalline alloys, Ge(1-x)Sn(x), are of interest due to theoretical predictions about their electronic band structures which make them useful in infrared photodetectors. However the composition region where these alloys have the desired properties is greater than the equilibrium solid solubility limit of Sn in Ge (x less than or equal to 0.01). The authors have circumvented the solubility limits and produced thin (2,000 A) and thick (4-8 micron) films of Ge(1-x)Sn(x) (x less than or equal to 0.31) by RF sputtering. Differential scanning calorimetry (DSC) measurements were performed to study grain growth and crystallization processes in these highly metastable semiconductors. X-ray and electron diffraction measurements indicated the materials were amorphous, but the fact that some of the films were fine grained polycrystalline samples only became apparent in their DSC spectra. The authors present models that describe quantitatively the transformation behavior in both sets of films. DOE

ORIENTED Si AND Ge NANOCRYSTALS FORMED IN Al2O3 BY ION IMPLANTATION AND ANNEALING
C. W. White, J. D. Budai, S. P. Withrow, S. J. Pennycook, D. S. Zhou, T. Vo-Dinh, D. M. Hembree, and R. H. Magruder Nov. 1993 10 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC05-84OR-21400)
(DE94-005593; CONF-931108-52) Avail: CASI HC A02/MF A01

Ion implantation followed by thermal annealing in a reducing atmosphere has been used to create a high density of oriented Si and Ge nanocrystals in (0001) Al2O3. Both types of nanocrystals are three dimensionally aligned with respect to the Al2O3 matrix, but the orientational relationships are different, and the two types of nanocrystals have different shapes in Al2O3. Implantation of Si and Ge in fused silica also produces nanocrystals, but in this case the nanocrystals are randomly oriented relative to each other. DOE

ON THE NATURE OF STRIAE IN STRONTIUM BARIUM NIOBATE
R. R. Monchamp, G. B. Mihalik, and L. A. Franks 1993 16 p
(Contract DE-AC08-93NV-11265)
(DE94-006486; EGG-11265-2040) Avail: CASI HC A03/MF A01

Strontium barium niobate crystals were grown by the Czochralski technique. These crystals were 15 to 20 mm in diameter and 25 to 75 mm long. Two types of striae, designated as coarse and fine, were characterized. The coarse striae are optically dense and are spaced by

100 to 500 micron apart; the fine striae are optically less dense and spaced 5 to 50 micron apart. The origins of the striae are attributed to thermal fluctuations in the melt related to the control system and to rotation of the growing crystal in non-isothermal radial gradients. Analysis of the crystals would indicated that the coarse striae may contain increased concentrations of sodium. DOE

NEW ZINC-BIS(DIALKYLAMIDES) POTENTIALLY USABLE AS SITE-SELECTIVE DOPANTS FOR p-TYPE ZnSe Interim Report, 1 Jul. 1992 - 1 Mar. 1994
William S. Rees, Jr. and Oliver Just 8 Mar. 1994 10 p
(Contract N00014-92-J-1820)
(AD-A276947; TR-3) Avail: CASI HC A02/MF A01

In earlier work, the effective utilization of Zn(NSi(CH3)32)2 as a site-selective dopant for the production of p-type ZnSe by OMVPE was demonstrated. Several new zinc-bis(dialkylamides) of the general form (R)(R')NZnN(R)(R') have been prepared. They have been characterized by 1H- and 13C-NMR, GC/MS, and elemental analysis. Vapor pressures and gas phase decomposition profiles have been examined. Correlations of vapor pressure and structure are discussed for this series of compounds. A mechanism for the site-selectivity observed in the incorporation of nitrogen is proposed. DTIC

N(EXP n(n-1)/2)-STATE R-MATRIX RELATED WITH U(SUB q)(sl(n)) ALGEBRA AT q(EXP 2N) = 1
R. M. Kashaev and V. V. Mangazeev 1992 12 p Submitted for publication Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608140; IHEP-TD-92-32) Avail: CASI HC A03 (US Sales Only)

The N(exp n(n-1)/2)-state R-matrix related with U(sub q)(sl(n)) algebra at q(exp 2N) = 1 is presented. Its matrix elements are interpreted as Boltzmann weights of an elementary box of some 2d lattice statistical model and given in terms of W-bar weights of the 'minimal' sl(n) chiral Potts model. The corresponding family of transfer matrices depends on n rapidity variables living on high genus algebraic curves, the latter being defined by n moduli. DOE

NOVEL GROWTH TECHNOLOGIES FOR IN SITU FORMATION OF SEMICONDUCTOR QUANTUM WIRE STRUCTURES Final Report
S. P. DenBaars 1994 14 p
(Contract N00014-92-J-1694)
(AD-A277188) Avail: CASI HC A03/MF A01

Novel growth technologies were developed for low dimensional quantum materials and devices. Non-hydride MOCVD and use of strain to produce InP quantum dots have been achieved. This ONR contract was key to our development of the less hazardous novel non-hydride sources, tertiary butyl arsine (TBA) and tertiary butyl phosphine (TBP) for the growth on InP based electronic devices. Indium Phosphide channel JFET were fabricated by MOCVD using tertiary butyl phosphine (TBP) as the alternative source for phosphine for the first time. We have developed the Stranski-Krastanow (SK) growth mode for the in-situ formation of InP quantum dots. It has been observed that many strained systems exhibit Stranski-Krastanow growth, where the epitaxy initiates in two dimensions but transforms to three dimensions with the formation of dislocations in response to the energetics and kinetics of the layer. STABILITY AND PRECIPITATION KINETICS IN Si(1-y)C(y)/Si AND Si(1-x-y)Ge(x)C(y)/Si HETEROSTRUCTURES PREPARED BY SOLID PHASE EPITAXY
J. W. Strane (Cornell Univ., Ithaca, NY.), S. T. Picraux, H. J. Stein, S. R. Lee, J. Candelaria, D. Theodore, and J. W. Mayer 1993 6 p Presented at the Fall Meeting of the Materials Research Society, Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC04-94AL-85000)
(DE94-006589; SAND-93-1473C; CONF-931108-63) Avail: CASI HC A02/MF A01

This study investigates the stability of metastable Si(1-y)C(y)/Si heterostructures during rapid thermal annealing (RTA) over a temperature range of 1,000-1,150 C. Heterostructures of Si(1-y)C(y)/Si and Si(1-x-y)Ge(x)C(y)/Si (where x =0.77 and y is less than or equal to 0.0014) were formed by solid phase epitaxy from C implanted, preamorphized substrates using a 30 minute 700 C anneal in N2. The occupancy of C in substitution lattice sites was monitored by Fourier Transform Infrared Absorption spectroscopy. The layer strain was monitored by rocking curve X-ray diffraction and the structural changes in the layers were determined using plan-view and X-sectional transmission electron microscopy (TEM). For anneals of 1,150 C or above, all the substitutional C was lost from the Si lattice after 30 seconds. TEM verified that the strain relaxation was the result of C precipitating into highly aligned (beta)SiC particles rather than by the formation of extended defects. No nucleation barrier was observed for the loss of substitutional C. Preliminary results will also be discussed for Si(1-x-y)Ge(x)C(y)/Si heterostructures where there is the additional factor of the competition between strain energy and the chemical driving forces. DOE

HETEROEPITAXIAL DIAMOND GROWTH Final Report, 1 Jan. - 31 Dec. 1993
R. J. Markunas, R. A. Rudder, J. B. Posthill, R. E. Thomas, and G. Hudson Feb. 1994 102 p
(Contract N00014-92-C-0081)
(AD-A277178; RTI/5294/94-Quarterly; RTI-83U-5294) Avail: CASI HC A06/MF A02

Technical highlights from 1993 include the following: Growth Chemistries: A clear correlation was observed between ionization potential of feedstock gasses and critical power necessary for inductive coupling of the plasma and consequent diamond growth. Substrate preparation and epitaxial film quality: Ion-implantation of C and O has been coupled with either electrochemical etching or acid cleaning for surface preparation prior to homoepitaxial growth. Reactor modifications: Key improvements were made to the RF reactor to allow for long growths to consolidate substrates. Liquid mass flow controllers were added to precisely meter both the water and selected alcohol. Ion-implantation and lift off: Lift off of diamond platelets has been achieved with two processes. Ion-implantation of either C or O followed by annealing and implantation of either C or O followed by water based electrolysis. Diamond characterization: Development of novel detect characterization techniques: (1) Etch delineation of defects by exposure to propane torch flame. (2) Hydrogen plasma exposure to enhance secondary electron emission and provide non-topographical defect contrast. Acetylene will react at room temperature with sites created by partial desorption of oxygen from the (100) diamond surface. Thermal desorption measurements give an apparent activation energy for CO desorption from diamond (100) of 45 kcal/mol. Quantum chemical calculations indicate an activation energy of 38 kcal/mol for CO desorption. Ab initio calculations on (100) surfaces indicates that oxygen adsorbed at one dimer site has an effect on the dimerization of an adjacent site. DTIC

LOWERING THE SCHOTTKY BARRIER AT METAL OR SILICIDE/SI INTERFACES TO EXTEND THE RANGE OF INFRARED DETECTORS
Final Report, Sep. 1992 - Aug. 1993
C. L. Griffiths Nov. 1993 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0342-90)
(AD-A277253; EOARD-TR-94-03) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Si and group IV based Schottky barriers (SB) below about 0.2 eV are of considerable technological importance since detectors based upon them will be able to probe deep into the infrared while maintaining well established processing techniques. Investigations relating to this problem have been carried out using ultrahigh vacuum techniques and x ray photoelectron spectroscopy. Two approaches have been pursued, one by tailoring the interface geometric and hence electronic structure and the other by using a reduced band gap material. The systems studied were Sn on Si(111) and Pt on Ge(111). Sn invokes several surface reconstructions on Si(111), one of which, the 2 times the square root of 3 structure, has an associated electronic structure with the Fermi level situated 0.14 +/- 0.10 eV above the valence band maximum (VBM). This means that the corresponding p-type SB is also 0.14 +/- 0.10 eV, well below the value of 0.22 eV found at the PtSi/Si(100) interface. Similarly, when Pt was deposited onto Ge(100), the Fermi level was positioned 0.12 +/- 0.04 eV above the VBM, again resulting in a p-type SB significantly lower than that at the PtSi/Si(100) interface. Chemical interactions at the Pt/Ge interface are discussed. DTIC

DEFECT CASCADES PRODUCED BY NEUTRON IRRADIATION IN YBa2Cu3O(7-DELTA) SUPERCONDUCTORS
M. C. Frischherz, M. A. Kirk, and J. Farmer Feb. 1994 7 p Presented at the 7th IWCC International Workshop on Critical Currents in Superconductors, Alpbach, Austria, 24-27 Jan. 1994
(Contract W-31-109-eng-38)
(DE94-007700; ANL/MSD/CP-82067; CONF-940122-3) Avail: CASI HC A02/MF A01

The defect cascades produced by fast neutron irradiation of YBa2Cu3O(7-delta) single crystals were studied by transmission electron microscopy. The visible defects were found to have sizes between 1 and 5 nm. Defect densities were obtained as a function of neutron fluence between 2 and 8 x 10(exp 21) m(exp -2) (E greater than 0.1 MeV). The measured defect density scales linearly with fluence and amounts to 1 x 10(exp 22) m(exp -3) at a neutron fluence of 2 x 10(exp 2l) m(exp -2). The defect stability was studied at room temperature and through annealing to 400 C. DOE

INTRA-CASCADE SURFACE RECOMBINATION OF POINT DEFECTS DURING ION BOMBARDMENT OF Ge(001)
J. A. Floro, B. K. Kellerman, E. Chason, S. T. Picraux, D. K. Brice, and K. M. Horn 1993 6 p Presented at the Materials Research Society Meeting, Pittsburgh, PA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC04-94AL-85000)
(DE94-007740; SAND-94-0357C; CONF-9311153-3) Avail: CASI HC A02/MF A01

Low energy Ar and Xe ion bombardment of Ge(001) produces large numbers of point defects on the Ge surface and in the near-surface regions. Defect concentrations on the surface are detected and quantified in real time during bombardment using in situ Reflection High Energy Electron Diffraction (RHEED). We report the energy dependence of the defect yield for 70-500 eV Ar and Xe ion bombardment, and the temperature dependence of the defect yield (defects/ion) during 200 eV ion bombardment. The defect yield drops rapidly as the substrate temperature during bombardment is varied from 175 to 400 K. We attribute the yield reduction to surface recombination of adatoms and vacancies produced in the same collision cascade. DOE

A well-controlled, high-yield Josephson junction process in high temperature superconductors (HTS) is necessary for the demonstration of ultra-high-speed devices and circuits which exceed the capabilities of conventional electronics. The authors developed nanobridge Josephson junctions in high quality thin-film YBaCuO with dimensions below 100 nm fabricated using electron-beam nanolithography. They characterized this Josephson junction technology for process yield, junction parameter uniformity, and overall applicability for use in high-performance circuits. To facilitate the determination of junction parameters, they developed a measurement technique based on spectral analysis in the range of 90-160 GHz of phase-locked, oscillating arrays of up to 2,450 Josephson junctions. Because of the excellent yield and uniformity of the nanobridge junctions, they successfully applied the junction technology to a wide variety of circuits. These circuits included transmission-line pulse formers and 32 and 64-bit shift registers. The 32-bit shift register was shown to operate at clock speeds near 100 GHz and is believed to be one of the faster and more complex digital circuit demonstrated to date using high temperature superconductor technology. POINT DEFECT PRODUCTION, GEOMETRY, AND STABILITY IN SILICON: A MOLECULAR DYNAMICS SIMULATION STUDY
M. J. Caturla, T. D. delaRubia, and G. H. Gilmer Feb. 1994 8 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract W-7405-eng-48)
(DE94-008292; UCRL-JC-116364; CONF-931108-92) Avail: CASI HC A02/MF A01

We present results of molecular dynamics computer simulation studies of the threshold energy for point defect production in silicon. We employ computational cells with 8000 atoms at ambient temperature of 10 K that interact via the Stillinger-Weber potential. Our simulations address the orientation dependence of the defect production threshold as well as the structure and stability of the resulting vacancy-interstitial pairs. Near the (111) directions, a vacancy tetrahedral-interstitial pair is produced for 25 eV recoils. However, at 30 eV recoil energy, the resulting interstitial is found to be the (110) split dumbbell configuration. This Frenkel pair configuration is lower in energy than the former by 1.2 eV. Moreover, upon warming of the sample from 10 K the tetrahedral interstitial converts to a (110) split before finally recombining with the vacancy. Along (100) directions, a vacancy-(110) split interstitial configuration is found at the threshold energy of 22 eV. Near (110) directions, a wide variety of closed replacement chains are found to occur for recoil energies up to 45 eV. At 45 eV, the low energy vacancy-(110) split configuration is found. At 300 K, the results are similar. We provide details on the atomic structure and relaxations near these defects as well as on their mobilities. DOE

ATTEMPTS TO MODEL THE GENERATION OF NEW GRAIN BOUNDARIES DURING THE DEFORMATION OF POLYCRYSTALS
U. F. Kocks, J. D. Cotton, S. R. Chen, S. I. Wright, A. D. Rollett, J. D. Embury, and A. J. Beaudoin 1993 11 p Presented at the Fall Meeting of the Minerals, Metals and Materials Society: Physical Metallurgy and Materials, Pittsburgh, PA, 17-21 Oct. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-36)
(DE94-007527; LA-UR-93-4520; CONF-931009-21) Avail: CASI HC A03

We explore ways by which new orientations (nuclei) can arise during essentially homogeneous defo rmation in polycrystals. All of these can be categorized as generating new large-angle boundaries: one is due to excessive storage of dislocations of one sign parallel to existing grain boundaries; another is due to reactions of cell walls with grain edges; and in the last, new boundaries are created surrounding a domain of different slip system distribution. DOE

EFFECT OF TWIN BOUNDARY DENSITY ON THE VORTEX MELTING TRANSITION IN YBa2Cu3O(7-DELTA) SINGLE CRYSTALS
W. K. Kwok, J. Fendrich, S. Fleshler, U. Welp, and G. W. Crabtree Jan. 1994 7 p Presented at the 7th IWCC International Workshop on Critical Currents in Superconductors, Alpbach, Austria, 24-27 Jan. 1994
(Contract W-31-109-eng-38)
(DE94-007684; ANL/MSD/CP-82175; CONF-940122-2) Avail: CASI HC A02/MF A01

The authors present magnetotransport rho(H,T) measurements in clean untwinned and twinned crystals of YBa2Cu3O(7-delta) in magnetic fields up to 8 Tesla for H parallel to c. In untwinned crystals, they show strong support for a vortex solid to liquid first order melting transition at a temperature T(sub m), much below the mean field transition temperature T(sub c)(H), characterized by an extremely sharp drop in resistivity rho(T(sub m)) and the appearance of hysteretic behavior at rho(H(sub m)). In densely twinned crystals, the sharp transition is replaced with a continuous transition at a higher temperature T(sub BG) greater than T(sub m). Furthermore, the cusp in T(sub BG)(theta) predicted by the Bose glass theory at fixed field is observed. In dilutely twinned crystals they demonstrate the competing effect of pinning and freezing at the phase transition. The vortex solid state at low fields is characterized by the appearance of a 'peak effect' just below the melting temperature. DOE

HIGH T(SUB c) SUPERCONDUCTOR TUNNEL JUNCTIONS FOR PHOTON DETECTORS
John Zasadzinski (Illinois Inst. of Tech., Chicago.), Jun Chen, K. E. Gray, and D. G. Hinks Feb. 1994 9 p Presented at the International Conference on Millimeter and Submillimeter Waves, San Diego, CA, 10-14 Jan. 1994
(Contract W-31-109-eng-38)
(DE94-007686; ANL/MSD/CP-82165; CONF-940132-2) Avail: CASI HC A02/MF A01

Superconducting - insulator - superconducting (SIS) and normal metal counterelectrode (SIN) quasiparticle tunnel junctions on high T(sub c) superconductors (HTS) offer the possibility of low-noise, heterodyne, photon detection in the THz regime. We report progress on the development of such junctions using mechanical point contacts. In general, these contacts display the optimum characteristics that can be obtained from HTS native-surface tunnel barriers. The bismuthate, Ba(1-x)K(x)BiO3, (T(sub c) = 25 K), displays ideal, BCS, quasiparticle characteristics at T = 4.2 K; however, at temperatures T approximately T(sub c)/2 there is evidence of strong quasiparticle damping which may inhibit device performance. The cuprates typically display nonideal quasiparticle characteristics including large sub-gap conductances. Recent data for the new Hg-based cuprates (T(sub c) = 96 K) are promising in that they exhibit very low and flat sub-gap conductances as expected from a BCS density of states. Proximity effect tunnel junctions on Bi2Sr2CaCu2O8/Au bilayers have been studied using an In tip. An induced energy gap has been consistently observed in the Au layer and the data can be understood using the McMillan model. A few junctions show much improved sub-gap characteristics compared to ones made directly on the BSCCO surface and indicate that this approach may be suitable for mixer development. DOE

BORON AND HYDROGEN IN Ni3Al. PART 2: MECHANICAL TESTING OF BICRYSTALS
P. E. Johnson, W. Gourdin, A. Gonis, N. Kioussis, and M. Vaudin Jan. 1994 6 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract W-7405-eng-48)
(DE94-007441; UCRL-JC-114159-Pt-2; CONF-931108-84-Pt-2) Avail: CASI HC A02/MF A01

To provide a sensitive measurement of the effect of boron segregation on the strength and ductility of Ni3Al grain boundaries, bicrystal tensile tests were performed on small specimens of boron doped Ni76Al24 cut from extremely large-grained boules. Five specimens with the same 'random' or low-symmetry grain boundary (disorientations measured by means of backscattered Kikuchi patterns) and two specimens with a second random grain boundary were tested in quenched and slow-cooled conditions. Duplicate tests performed in a low (7 ppM) water-vapor environment showed that the fracture mode and the stress and strain at fracture are altered by environmental embrittlement at individual, partially strengthened grain boundaries. FEMTOSECOND PROBE-PROBE TRANSMISSION STUDIES OF LT-GROWN GaAs NEAR THE BAND EDGE
H. B. Radousky, A. F. Bello, D. J. Erskine, L. N. Dinh, M. J. Bennahmias, M. D. Perry, T. R. Ditmire, and R. P. Mariella, Jr. Dec. 1993 8 p Presented at the Spring Meeting of the Materials Research Society, San Francisco, CA, 4-8 Apr. 1994
(Contract W-7405-eng-48)
(DE94-006660; UCRL-JC-115625; CONF-940411-1) Avail: CASI HC A02/MF A01

We have studied the near-edge optical response of a LT-grown GaAs sample which was deposited at 300 C on a Si substrate, and then annealed at 600 C. The Si was etched away to leave a 1 micron free standing GaAs film. Femtosecond transmission measurements were made using an equal pulse technique at four wavelengths between 825 and 870 nm. For each wavelength, we observe both a multipicosecond relaxation time, as well as a shorter relaxation time which is less than 100 femtoseconds. DOE

SHORT COHERENCE LENGTH SUPERCONDUCTORS: INTERMEDIATE REGIME BETWEEN BCS AND BOSONS
Jan R. Engelbrecht (Los Alamos National Lab., NM.), Mohit Randeria, and Carlos A. R. SadeMelo Feb. 1994 5 p Presented at the Strongly Correlated Electron Materials, Los Alamos, NM, 15-18 Dec. 1993
(Contract W-31-109-eng-38)
(DE94-007694; ANL/MSD/CP-82054; CONF-931247-7) Avail: CASI HC A01/MF A01

In order to understand the high (Tc) materials, conventional superconductors and their metallic normal states are examined to see how generalizations of BCS pairing may lead to unconventional properties. The persistence of gap-like features in the normal state up to temperatures several times (Tc) is shown. The short coherence length and normal state pseudo-gaps are suggestive of preformed pairs which Bose condense at the superconducting transitions; the normal state is a degenerate Fermi system in which correlations lead to pseudo-gaps. It is argued that these deviations from Fermi liquid behavior are characteristic of the normal state of short coherence length superconductors. DOE

AB INITIO STUDY OF THE EPITAXIAL GROWTH OF Ge ON Si(100) SURFACE
V. Milman, S. J. Pennycook, D. E. Jesson, M. C. Payne, and I. Stich Nov. 1993 7 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC05-84OR-21400)
(DE94-007245; CONF-931108-83) Avail: CASI HC A02/MF A01

We identify the binding sites for adsorption of a single Ge atom on the Si(100) surface using ab initio total energy calculations. The calculated diffusion barriers are in excellent agreement with experimental estimates. Using a large supercell we resolve the controversy regarding the binding geometry and migration path for the adatom, and investigate the influence of the adatom on the buckling of Si dimers. The adatom induces a buckling defect that is frequently observed using scanning tunneling microscopy (STM); therefore, the study of single adatoms may be experimentally accessible. DOE

STRONGLY ANISOTROPIC s-WAVE VERSUS d-WAVE GAP IN CUPRATE SUPERCONDUCTORS: EVIDENCE AND THEORY
Baird Brandow 1994 5 p Presented at the Strongly Correlated Electron Materials, Los Alamos, NM, 15-18 Dec. 1993
(Contract W-7405-eng-36)
(DE94-007579; LA-UR-94-563; CONF-931247-8) Avail: CASI HC A01/MF A01

As is well known, the d-wave gap scenario for cuprate superconductors

has strong support from several lines of evidence: (1) evidence for strong gap anisotropy, e.g. the Stanford photoemission data; (2) evidence for gap nodes, e.g. the UBC studies of penetration depth lambda(sub L)(T) at low T(much less than T(sub c)); (3) a pairing interaction based on the strong quasiparticle repulsion at q = (pi,pi), the latter being clearly established from inelastic neutron scattering and NMR data; and, (4) the phenomenological theory also provides a source for the strong (and linear) resistivity. The d-wave gap scenario and theory are, therefore, very plausible. The authors now point out that there is a viable alternative scenario -- a highly anisotropic s-like gap form -- which is also consistent with the evidence just mentioned. This form is supported by additional experimental evidence, and by a qualitative dynamical argument, and also by detailed and nearly ab initio calculations based on a systematic theory. This theory is based on the assumption of strong electronic correlations of the type found in valence-fluctuation and heavy-fermion materials. DOE

QUANTUM FLUCTUATIONS OF VORTICES IN JOSEPHSON-COUPLED SUPERCONDUCTORS
L. N. Bulaevskii and M. P. Maley 1994 19 p Presented at the Superconducting Superlattices and Multilayers and Oxide Superconductory Physics and Nanoengineering, Los Angeles, CA, 23-28 Jan. 1994
(Contract W-7405-eng-36)
(DE94-007609; LA-UR-94-538; CONF-940121-3) Avail: CASI HC A03/MF A01

The effect of quantum fluctuations of vortices on the low temperature specific heat and reversible magnetization in the mixed state in highly anisotropic layered superconductors is discussed. For reversible magnetization, M, the change of slope in the dependence of M vs ln B, observed in Bi(2:2:1:2), is explained. In the mean field approach, this slope should be almost B independent. The specific heat due to the vortex fluctuation contribution is predicted to be linear in T at low T. DOE

(DE94-006855; NREL/TP-411-6399) Avail: CASI HC A03/MF A01

This report describes work to advance the manufacturing line capabilities in crystal growth and laser cutting of Mobil Solar's unique edge-defined film-fed growth (EFG) octagon technology and to reduce the manufacturing costs of 10 cm x 10 cm polycrystalline silicon EFG wafers. The report summarizes the significant technical improvements in EFG technology achieved in the first 6 months of the PVMaT Phase 2 and the success in meeting program milestones. Technical results are reported for each of the three main pregrain areas: Task 5 -- Thin octagon growth (crystal growth) to reduce the thickness of the octagon to 200 microns; Task 6 -- Laser cutting-to improve the laser cutting process so as to produce wafers with decreased laser cutting damage at increased wafer throughput rates; and Task 7 -- Process control and product specification to implement advanced strategies in crystal growth process control and productivity designed to increase wafer yields. ISOTHERMAL SINTERING, MICROSTRUCTURE, AND SUPERCONDUCTING PROPERTIES OF Y1Ba2Cu3O(7-x) COMPOUND
R. N. Viswanath (Madras Univ., India.), S. Ramasmay (Madras Univ., India.), W. Schaper (Goettingen Univ., Germany.), K. Gehrke (Goettingen Univ., Germany.), and U. Balachandran 1994 42 p
(Contract W-31-109-eng-38)
(DE94-008132; ANL/MCT/PP-72124) Avail: CASI HC A03/MF A01

Polycrystalline YBa2CuO(7-x) was prepared by the solid state reaction method and characterized by x-ray powder diffraction method, Meissner effect, resistivity by the four probe method, and iodometric titrations. The material was processed at 930 C, and isothermal sintering behavior up to 96 was studied using positron lifetime, x-ray powder diffraction (SEM), four probe method for resistivity, and critical current vs magnetic field and differential thermal analysis (DTA). Two types of grain morphology are observed by SEM one below 36 and one above 36 sintering. DTA shows a peak around 954 C. Positron lifetime results reveal that the lifetime values and (tau)(sub 1) and (tau)(sub 2) arise from positron trapping in strained/deformed regions and microvoids formed in the triple defect junctions (TDJ), respectively. The size of the defect responsible for the pinning centers is estimated from positron lifetime data. Reasons for the lesser value of transport J(sub c) (24.72 A/sq cm), obtained in the compound sintered at 930 C are explained. The nature of defects related to the resistivity component in the compound is also discussed. DOE

PROPERTIES OF DOPED AND UNDOPED (Ca,Sr)CuO2 THIN FILMS
D. P. Norton, B. C. Chakoumakos, J. D. Budai, E. C. Jones, D. K. Christen, and D. H. Lowndes Dec. 1993 22 p Presented at the Electro Technical Laboratory Workshop on High Temperature Superconductors, Tokyo, Japan, 6-10 Dec. 1993
(Contract DE-AC05-84OR-21400)
(DE94-007230; CONF-931257-1) Avail: CASI HC A03/MF A01

The authors have studied the transport and structural properties of (Ca,Sr)CuO2, Sr(1-y)Nd(y)CuO2, and Sr(1-x)CuO(2-(delta)) thin films grown by pulsed-laser deposition. Stoichiometric 'infinite layer' (Ca,Sr)CuO2 thin films grown over a large range of growth conditions are insulators, while superconductivity is observed in Sr(1-y)Nd(y)CuO2 films with (Tc)(onset) (approximately) 28 K for y = 0.10. A Nd solubility limit of y = 0.10 is observed with the appearance of a new phase with c approximately 0.37 nm for y greater than 0.10. In addition, the transport and structural properties of Sr(1-x)CuO(2-(delta)) thin films grown by pulsed-laser deposition support the contention that the tetragonal phase is capable of accommodating a significant density of alkaline-earth deficiencies up to x less than or equal to 0.3. Resistivity measurements indicate a significant change in the carrier density of the CuO2 planes as Sr vacancies are introduced. In addition, an enigmatic anomaly in resistivity at 185 K is observed for Sr(0.85)CuO(2-(delta)) thin films. Magnetic measurements on these samples indicate that, although a significant drop in resistivity at 185 K is observed, it is not due to a superconducting transition. Hall measurements, as well as changes in resistivity with film growth conditions, suggest that the majority carriers in these Sr(1-x)CuO(2-(delta)) thin films are electrons even with the Sr-vacancies present. NEAR EDGE X RAY SPECTROSCOPY THEORY
1994 9 p
(Contract DE-FG06-90ER-45415)
(DE94-008179; DOE/ER-45415/T1) Avail: CASI HC A02/MF A01

We propose to develop a quantitative theory of x-ray spectroscopies in the near edge region, within about 100 eV of threshold. These spectroscopies include XAFS (x-ray absorption fine structure), photoelectron diffraction (PD), and diffraction anomalous fine structure (DAFS), all of which are important tools for structural studies using synchrotron radiation x-ray sources. Of primary importance in these studies are many-body effects, such as the photoelectron self-energy, and inelastic losses. A better understanding of these quantities is needed to obtain theories without adjustable parameters. We propose both analytical and numerical calculations, the latter based on our x-ray spectroscopy codes FEFF. DOE

(Contract W-31-109-eng-38)
(DE94-007649; ANL/MCS/CP-82091; CONF-940456-13) Avail: CASI HC A02/MF A01

In this paper, we present a new discrete formulation that maintains discrete invariance and is suitable for use on nonorthogonal meshes. This formulation, unlike its predecessors, allows us to easily use adaptive mesh refinement to concentrate grid points where error contributions are large (near vortex centers). In this way we reduce the total number of grid points required to accurately capture vortex configurations and allow the possibility of solving problems previously considered intractable. To solve these large problems, we require the memory capabilities and computational power of state-of-the-art parallel computers. To use these machines, we have developed scalable libraries for adaptive mesh refinement and partitioning on two-dimensional triangular grids. This general-purpose software uses bisection of the longest side to refine triangles in which error contributions are large. These adaptive meshes are both unstructured and dynamic, and we present a new geometric partitioning, algorithm that strives to minimize communication cost by ensuring good partition aspect ratios. We present computational results showing the efficiency of these adaptive techniques for a superconductivity application. DOE

RESISTIVITY MEASUREMENTS ON THE NEUTRON IRRADIATED DETECTOR GRADE SILICON MATERIALS
Zheng Li Nov. 1993 14 p Presented at the 1st International Conference on Large Scale Applications and Radiation Hardness of Semiconductor Detectors, Florence, Italy, 7-9 Jul. 1993
(Contract DE-AC02-76CH-00016)
(DE94-009083; BNL-49822; CONF-9307163-2) Avail: CASI HC A03/MF A01

Resistivity measurements under the condition of no or low electrical field (electrical neutral bulk (ENB) condition) were made on various device configurations on detector grade silicon materials after neutron irradiation. Results of the measurements have shown that the ENB resistivity increases with neutron fluence ((Phi)(sub n)) at low (phi)(sub n) (less than 10(exp 13) n/sq cm) and saturates at a value between 300 and 400 k(Omega)-cm at (phi)(sub n) approximately 10(exp 13) n/sq cm. Meanwhile, the effective doping concentration N(sub eff) in the space charge region (SCR) obtained from the C-V measurements of fully depleted p(sup +)/n silicon junction detectors was found to increase nearly linearly with (phi)(sub n) at high fluences ((phi)(sub n) greater than 10(exp 13) n/sq cm). The experimental results are explained by the deep levels crossing the Fermi level in the SCR and near perfect compensation in the ENB by all deep levels, resulting in N(sub eff) (SCR) nearly equal n or p (free carrier concentrations in the ENB). DOE

ULTRAHIGH-CURRENT-DENSITY METAL-ION IMPLANTATION AND DIAMONDLIKE-HYDROCARBON FILMS FOR TRIBOLOGICAL APPLICATIONS
P. J. Wilbur (Colorado State Univ., Fort Collins.) Sep. 1993 56 p
(Contract W-31-109-eng-38)
(DE94-008958; ANL/OTM/CR-4) Avail: CASI HC A04/MF A01

The metal-ion-implantation system used to implant metals into substrates are described. The metal vapor required for operation is supplied by drawing sufficient electron current from the plasma discharge to an anode-potential crucible so a solid, pure metal placed in the crucible will be heated to the point of vaporization. The ion-producing, plasma discharge is initiated within a graphite-ion-source body, which operates at high temperature, by using an argon flow that is turned off once the metal vapor is present. Extraction of ion beams several cm in diameter at current densities ranging to several hundred micro-A/sq cm on a target 50 cm downstream of the ion source were demonstrated using Mg, Ag, Cr, Cu, Si, Ti, V, B, and Zr. These metals were implanted into over 100 substrates (discs, pins, flats, wires). A model describing thermal stresses induced in materials (e.g. ceramic plates) during high-current-density implantation is presented. Tribological and microstructural characteristics of iron and 304-stainless-steel samples implanted with Ti or B are examined. Diamondlike-hydrocarbon coatings were applied to steel surfaces and found to exhibit good tribological performance. DOE

ELECTRON ENERGY DEPENDENCE OF AMORPHIZATION IN Zr3Fe
A. T. Motta (Pennsylvania State Univ., University Park.), L. M. Howe (Atomic Energy of Canada Ltd., Chalk River, Ontario.), and P. R. Okamoto Feb. 1994 7 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-31-109-eng-38)
(DE94-008459; ANL/MSD/CP-82234; CONF-931108-93) Avail: CASI HC A02

This paper reports the results from a study conducted to determine the effect of electron energy on the dose-to-amorphization of Zr3Fe at 23-30 K. Zr3Fe samples were irradiated in the HVEM at Argonne National Laboratory, at 200 to 900 keV. Amorphization occurred at electron energies from 900 keV down to 250 keV. Three distinct regions were observed: between 900 and 700 key amorphization occurred at a constant low dose of approximately 4 x 10(exp 21) e cm(exp -2); a higher plateau at 10(exp 22) was observed between 600 and 400 keV, and finally there was a sharp increase in the dose-to-amorphization below 400 key, so that at 250 key the necessary dose was an order of magnitude higher than that at 900 keV. In the region below 400 keV there was evidence of a dependence of the dose-to-amorphization on the orientation of the sample with respect to the electron beam. The results can be analyzed in terms of a composite displacement cross section dominated at high energies by displacements of Zr and Fe atoms, by displacements of Fe atoms at intermediate energies and of secondary displacements of lattice atoms by recoil impurities at low energies. DOE

INTERFACE CONTROLLED AMORPHIZATION OF CRYSTALLINE Ni/Ti MULTILAYERS
A. F. Jankowski, J. P. Hayes, and P. B. Ramsey Dec. 1993 6 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-48)
(DE94-008685; UCRL-JC-114168; CONF-931108-95) Avail: CASI HC A02

Solid-state amorphization (SSA) of crystalline interfaces is observed in the Ni/Ti multilayer system. The amorphization reaction nucleates at location(s) of crystallographic disorder, i.e. the multilayer interfaces. Microstructural analyses reveal the sputter-deposited growth structure to be epitaxial with semicoherent interfaces. Strain energy originating from interface lattice distortions varies as a function of the multilayer repeat spacing. Therefore, the interfacial energy effects the onset conditions for SSA. Differential thermal analysis is used to measure the critical temperature T(sub c) to the nucleation of the SSA, which is found to vary with the Ni/Ti multilayer pair spacing. DOE

PROCEEDINGS, STRONGLY CORRELATED ELECTRONIC MATERIALS: THE 1993 LOS ALAMOS SYMPOSIUM
K. S. Bedell 1994 662 p Proceedings held in Los Alamos, NM, 15-18 Dec. 1993

(Contract W-7405-eng-36)
(DE94-009293; LA-UR-94-1148; CONF-931247) Avail: CASI HC A99/MF A06

The subject included such topics as high temperature superconductors, heavy-fermion insulators and superconductors, the metal-insulator transition, the superconductor-insulator transition and unusual (non-Fermi liquid) normal metallic states. The symposium was structured around 13 invited review talks; with each talk, there were several (about 30) related short presentations and discussion sections (90 pages). The review talks and short papers were processed separately for the data base. DOE

INVESTIGATION OF SUPERCONDUCTIVITY AND MAGNETISM IN d AND f-ELECTRON MATERIALS
1993 17 p
(Contract DE-FG03-86ER-45230)
(DE94-008535; DOE/ER-45230/T2) Avail: CASI HC A03/MF A01

Emphasis has been on high (Tc) cuprate superconductors, along with some experiments on heavy fermion materials. Approach involved the preparation of novel materials, including high (Tc) oxide and rare earth and uranium intermetallic compounds in polycrystals and single crystals, and the investigation of transport, thermal, and magnetic properties of these materials down to 50 mK, in magnetic fields up to 10 tesla, and pressures up to 160 kbar. Other measurements, such as neutron scattering, micro-SR, and photoemission, are carried out at national facilities. DOE

IMAGING OF SURFACE STRUCTURE WITH ENERGY-DEPENDENT PHOTOELECTRON DIFFRACTION
J. G. Tobin, G. D. Waddill, Hua Li, and S. Y. Tong Aug. 1993 10 p Presented at the 4th International Conference on the Structure of Surfaces, Shanghai, China, 16-19 Aug. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-48)
(DE94-009096; UCRL-JC-112889; CONF-9308154-4) Avail: Issuing Activity (Department of Energy (DOE))

Energy-dependent photoelectron diffraction (EDPD) has been used to determine the surface structure of a surface alloy. Direct imaging has been achieved by Fourier transformation of experimental energy-dependent photoelectron diffraction data. This holographic method, based upon the intersection of contour arcs associated with each measurement direction, can provide vectorial atomic positions with atomic resolution. Experimental analysis is supported by Fourier transformation of simulations from multiple scattering calculations. The surface geometry of c(2x2) Au/Cu(001) has been imaged in an elementally-specific manner, with clear, non-model-dependent discrimination of the surface alloy over the overlayer structure. DOE

EVIDENCE FOR SYMMETRY BREAKING LOCAL DISTORTIONS IN THALLIUM BARIUM COPPER OXIDE
Janis H. Nickel, Patrick G. Allen, Guonguang Li, Jose MustredeLeon, Ian D. Raistrick, and Steven D. Conradson 1994 5 p Presented at the Strongly Correlated Electron Materials, Los Alamos, NM, 15-18 Dec. 1993
(Contract W-7405-eng-36)
(DE94-006149; LA-UR-94-343; CONF-931247-9) Avail: CASI HC A01/MF A01

Extended x-ray absorption fine structure (EXAFS) show local structural anomalies in Tl2Ba2CuO6, which reduce the crystal symmetry; this symmetry lowering is interpreted as an indication of the existence of localized states. A local structural model consistent with the EXAFS results consists of a fraction of the O(1) sites displaced from the midpoint of the Cu-Cu bond, and dimpling of the CuO2 planes when the O(1) site is not displaced from this midpoint. OPTICAL PROPERTIES OF LANTHANIDE-DOPED RbTiOAsO4 AND TRANSITION METAL-DOPED KTiOPO4
M. L. F. Phillips, M. T. Anderson, and M. B. Sinclair 1993 24 p Presented at the LASERS 1993: International Conference on Lasers and Applications, Lake Tahoe, NV, 6-10 Dec. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC04-94AL-85000)
(DE94-008433; SAND-93-2112C; CONF-931237-7) Avail: CASI HC A03

We have synthesized derivatives of potassium titanyl phosphate (KTP) and rubidium titanyl (RTA) where Ti was replaced by transition metal or lanthanide ions, and K, Ti, P, or O was replaced by aliovalent counterions. Up to 5 mol % lanthanide ion can be substituted onto the Ti, and 100 mol % substitution of other transition metals onto the Ti sites in KTP can be made. The visible spectra of these doped KTP phases are characteristic of the dopant ions, with sharp, narrow transitions resulting from lanthanide substitution and broader absorptions from transition-metal dopants. Powder second harmonic generation (SHG) intensities diminish with increased dopant concentration. Decreases in SHG intensities parallel those seen in previously studied systems. The choice of counterion substantially impacts some dopant solubilities, but generally affects SHG intensity and visible spectrum to a lesser degree. Single crystals doped with Er(3+), Fe(3+), and Co(2+) have linear absorption coefficients in the range of 1 to 5 cm(exp -1). Changes in noncritical phase matching wavelength due to anomalous dispersion are calculated to be less than 1 nm at the dopant levels tested. DOE

MICROREFLECTANCE INFRARED STUDY OF ELECTRON-MOLECULAR VIBRATIONAL COUPLING AND LATTICE SOFTNESS IN BEDT-TTF SALTS
J. R. Ferraro (North Carolina State Univ., Raleigh.), Myung-Hwan Whangbo (North Carolina State Univ., Raleigh.), H. H. Wang, and P. Stout 1994 25 p
(Contracts W-31-109-eng-38; DE-FG05-86ER-45259)
(DE94-008490; ANL/CHM/PP-74824) Avail: CASI HC A03/MF A01

Microreflectance infrared (MR-IR) spectra were obtained for several (beta)- and (kappa)-phase salts of bis- (ethylenedithio) tetrathiafulvalene (BEDT-TTF or ET) and its deuterium analog d(sub 8)-ET by employing polarized and unpolarized light. The vibronic region of these MR-IR spectra provides information about the electron-molecular vibration (EMV) coupling, and the highest-frequency C-C-H bending vibration observed for an ET salt reflects the extent of its lattice softness. Under polarized light, the EMV coupling for an ET salt depends strongly upon how the light polarization vector is aligned with respect to the sample crystallographic axes. The lowest vibron frequency is indicative of increased EMV coupling. DOE

CHARACTERIZATION OF NANOPARTICLES AND NANOPHASE MATERIALS
R. W. Siegel Feb. 1994 15 p Presented at the European Science Foundation (ESF) Explorative Workshop: Aerosol Methods and Advanced Techniques for Nanoparticle Science and Nanopowder Technology, Duisburg, Germany, 4-9 Oct. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-31-109-eng-38)
(DE94-008348; ANL/MSD/CP-80658; CONF-9310287-1) Avail: Issuing Activity (Department of Energy (DOE))

Structures of nanoparticles and nanophase materials, both metals and ceramics, have been investigated over the past several years by a wide range of experimental methods. These studies included observations by the following: x-ray and neutron scattering; transmission and scanning electron microscopy; Moessbauer, Raman, and positron annihilation spectroscopies; and most recently scanning tunneling microscopy and nuclear magnetic resonance. These experiments yielded considerable information about the structures of nanoparticles and nanophase materials

on a variety of length scales, but much about the local atomic arrangements in these new materials remains to be elucidated. Present status of our knowledge of these structures is reviewed and some future needs are considered. DOE

A QUEST FOR A NEW SUPERCONDUCTING STATE
J. P. Collman and W. A. Little 1993 9 p
(Contract DE-FG03-86ER-45245)
(DE94-008439; DOE/ER-45245/T2) Avail: CASI HC A02/MF A01

The authors report on their progress during the past twelve months and the work that is planned for the coming year. They have been working on a theory to describe the long range proximity effect discovered experimentally on Bi-Ag-Tl(2223) sandwiches during the period of the previous grant. This has led to the prediction of a novel effect which they refer to as a 'pair echo' which occurs in these sandwiches and is analogous to the familiar 'spin echo' seen in certain NMR experiments. Experimentally, they have extended the measurements of the proximity effect to lower temperatures and to other superconductors. They have completed high resolution studies of the thermal difference optical reflectance of the high (T(sub c)) superconductor Tl(2223), for temperatures both above and below the transition temperature, over a photon energy range from 0.3 eV to 5.3 eV. A striking anomaly in this thermal difference spectrum was found near 1.6 eV, which appears below (T(sub c)) and scales in magnitude with temperature like (Delta)(T)(sup 2) where (Delta)(T) is a BCS gap. This is precisely the kind of effect which they had hoped to find, based on a Holstein-like mechanism in these materials, and which they had predicted in a paper on 'Gap Modulation'. The proper interpretation of the effect observed should reveal the mechanism responsible for the superconductivity of the cuprates. They have completed a search for the so-called Zhang-modes in the above high (T(sub c)) superconductor Tl(2223) over the same energy range, 0.3 eV to 5.3 eV. These modes are predicted to exist if the proper description of the ground state of the system is that of a Hubbard model. DOE

YBCO JOSEPHSON JUNCTION ARRAYS Final Report, 15 Jul. 1992 - 14 Jul. 1993
Randy Simon 14 Jul. 1993 29 p
(Contract F49620-92-C-0048)
(AD-A277426; AFOSR-94-0075TR) Avail: CASI HC A03/MF A01

Josephson junction arrays have long been suggested as efficient, tunable sources for upper microwave and mm-wave frequencies. Based on the fundamental properties of the junction and the ability to combine the power output of many junctions using an array, the circuit concept is quite promising. The challenge is to phase lock the junctions so that power adds coherently and a number of demonstrations with Nb junction arrays have been performed doing this. This program was intended to begin using YBCO junction arrays to demonstrate source potential at 77 K. Edge junctions have been used in arrays with up to 60000 junctions and the ability to couple power off-chip has been demonstrated directly for frequencies of at least 70-160 GHz. Power outputs have approached 1 micro W (in relatively narrow bands) and tunability has exceeded 20 GHz. Some novel array architectures have been built, including one with improved linewidth per unit junction, and new techniques developed for extracting junction statistics from array spectra. These techniques are used as feedback for process optimizations now in progress. DTIC

LOW ENERGY ION BEAM ASSISTED GROWTH OF HOMOEPITAXIAL SILICON FILMS AT LOW TEMPERATURE Final Report, 1 Mar. 1993 - 28 Feb. 1994
Kim W. Pierson 28 Feb. 1994 4 p
(Contract N00014-93-1-0195)
(AD-A278092) Avail: CASI HC A01/MF A01

The goal of this project was to lower the substrate temperature required to promote device quality epitaxial silicon growth below the 300 C mark set by a Japanese group led by T. Ohmi. Normally high substrate temperatures are required to achieve thin film epitaxial growth. A new thin film deposition technique called ion beam assisted deposition offers the possibility to grow epitaxial layers at low substrate temperatures. In this technique, while the atoms are condensing into the epilayer, they are bombarded by low energy noble gas ions. The kinetic energy of the incident ions supplants the thermal energy lost by lowering the substrate temperature and provides enough surface mobility so that the correct crystal structure can grow. Lower temperatures will reduce impurity and interlayer diffusion problems caused by high temperature growth processing steps. DTIC

RARE EARTH DOPED SEMICONDUCTORS AND MATERIALS RESEARCH SOCIETY SYMPOSIUM PROCEEDINGS, VOLUME 301 Final Report, 5 Feb. 1993 - 4 Feb. 1994
John Ballance 4 Feb. 1994 432 p Proceedings held in San Francisco, CA, 13-15 Apr. 1993
(Contract F49620-93-1-0156)
(AD-A277517; AFOSR-94-0042TR) Avail: CASI HC A19/MF A04

The properties of rare earth ions in solids were studied in detail for decades, but until recently this work was restricted to dominantly ionic hosts such as fluorides and oxides, and to a lesser extent to more covalently bonded hosts, such as tetrahedral 2-6 semiconductors. The idea of rare earth elements incorporated into covalent semiconductors such as GaAs and Si may be traced to a short communication in 1963 by R.L. Bell (J. Appl. Phys. 34, 1563 (1963)) proposing a dc-pumped rare earth laser. At about the same time, three unpublished technical reports appeared as a result of U.S. Department of Defense sponsored research in rare earth doped Si, GaAs, and InP to fabricate LED's. Attempts by other researchers to identify sharp 4f specific emissions in these hosts essentially failed. DTIC

HIGH TEMPERATURE SUPERCONDUCTING JOSEPHSON JUNCTION ARRAY SYSTEMS, PHASE 1 Final Report, 1 Jul. - 31 Dec. 1993
J. Martens, A. Pance, K. Char, M. Johansson, and S. Whiteley 25 Jan. 1994 29 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F49620-93-C-0041)
(AD-A277937; Rept-94001-SBIR-1-F; AFOSR-94-0132TR) Avail: CASI HC A03

High temperature superconducting Josephson arrays were investigated as possible millimeter wave sources. A junction technology was selected and improved to the point where radiation, near 1 microwatt off-chip, was measured from a variety of 2-dimensional arrays in the 70-160 GHz range. The arrays were tunable and were successfully coupled to a number of antennas for broadband, tunable transmission. Antennas for a variety of specific applications were selected on the basis of bandwidth requirements, impedance levels, polarization, and the possibility of sufficient monolithic integration. The final part of the program was a study of potential subsystems that would utilize these arrays. Interchip communications transceivers were studied and interchip coupling was demonstrated using two antenna-coupled arrays. The most promising application may be a monolithic clock source, near 100 GHz, for communications and signal processing systems. DTIC

QUANTUM WELL INFRARED PHOTODETECTOR FPA Final Report, 1 Sep. 1991 - 28 Feb. 1993
L. Kozlowski Mar. 1994 76 p
(Contract N00014-91-C-0163)
(AD-A278010; SC71061.FR) Avail: CASI HC A05/MF A01

The AT&T/Rockwell team met all the objectives of this collaborative program; AT&T supplied the QWIP detector arrays and Rockwell subsequently fabricated hybrid focal plane arrays using available high performance CMOS multiplexers, tested the hybrids, performed breadboard imaging demonstrations and delivered several hybrid FPA's. Eighteen hybrids were fabricated and evaluated. The collaboration yielded significant improvements in QWIP FPA performance and reliability and many milestones including: first BLIP LWIR FPA sensitivity demonstration at low photon backgrounds (less than 1 x 10(exp 12) photons/sq cm-sec) with the GaAs-based quantum well infrared photodetector (QWIP) technology, high LWIR FPA pixel operability; NE Delta T's as low as 5 mK at LWIR imaging backgrounds at f/1.4 and temperatures consistent with mechanical coolers (approx. 65K), increased coupling efficiency by over an order of magnitude; achieved effective quantum efficiency of approx. 10% with low crosstalk; effective quantum efficiencies of up to 30% under flood illumination, though

with high crosstalk; mean D* of 1 x10(exp 14) cm-Hz(exp 1/2)/W at 3.0 x 10(exp 9) photons/sq cm-sec background at 32.5K operating temperature with greater than 98% operability; maximum temperature for 9.5 microns m FPA BLIP sensitivity as high as 62K; excellent hybrid reliability by mechanically thinning the QWIP; and responsivity nonuniformity less than 3% rms, thus enabling greater than 83 dB dynamic range. DTIC

THE PATH FOR LONG RANGE CONDUCTION IN HIGH J(SUB c) TlBa2Ca2Cu3O(8+x) SPRAY-PYROLYZED DEPOSITS
D. M. Kroeger, A. Goyal, E. D. Specht, Z. L. Wang, J. E. Tkaczyk, J. A. Sutliff, and J. A. DeLuca 1993 9 p Presented at the Fall Meeting of the Minerals, Metals and Materials Society: Physical Metallurgy and Materials, Pittsburgh, PA, 17-21 Oct. 1993
(Contract DE-AC05-84OR-21400)
(DE94-007211; CONF-931009-20) Avail: CASI HC A02/MF A01

Grain boundary misorientations and local texture in polycrystalline TlBa2Ca2Cu3O(8+x) deposits prepared by thallination of spray-pyrolyzed precursor deposits on yttria-stabilized zirconia have been determined from transmission electron microscopy, electron backscatter diffraction patterns, and x ray diffraction. The deposits were polycrystalline, had small grains, and excellent c-axis alignment. The deposits contained colonies of grains with similar but not identical a-axis orientations. Most grain boundaries within a colony have small misorientation angles and should not be weak links. It is proposed that long range current flow occurs through a percolative network of small angle grain boundaries at colony intersections. DOE

SENSITIVITY OF ELECTROCHEMICAL ADLAYER STRUCTURE TO THE METAL CRYSTALLOGRAPHIC ORIENTATION: POTENTIAL-INDEPENDENT IODIDE ADSORPTION ON Au(100) IN COMPARISON WITH OTHER LOW-INDEX SURFACES
Xiaoping Gao, Gregory J. Edens, Fan-Chen Liu, and Michael J. Weaver Feb. 1994 43 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1409)
(AD-A276714; TR-153) Avail: CASI HC A03

The potential-dependent ordered atomic structures formed for iodide adsorption on Au(100) from dilute aqueous alkali iodide electrolytes as discerned by means of in-situ scanning tunneling microscopy (STM) are reported and compared to the corresponding behavior of the other two low-index faces, Au(111) and (110). As in related studies, emphasis is placed on linking the microscopic structural information to the voltammetric and other macroscopic electrochemical response including the use of 'potentiodynamic' STM tactics where real-space images are acquired during appropriate electrode potential steps or sweeps. While relatively low iodide coverages, theta(sub I) approximately equal to 0.1, are sufficient to lift the hexagonal Au(100) reconstruction, yielding large ordered (1 x 1) domains by ca-0.6 V vs SCE, ordered iodide adlayers are formed only above -0.2 V. A compressible incommensurate (2 sq rt 2 x p sq rt 2) phase (theta(sub I) approximately equal to 0.46 - 0.49) is observed between ca -0.2 and 0 V, which reverts to a distinct (2 sq rt of 2 x sq rt of 2)R45 deg structure (theta(sub I) approximately equal to 0.5) featuring uniform binding in twofold bridging sites. Interestingly, while the latter structure is retained locally at higher potentials, it is interspersed with narrow (3-4 atom wide) strips having a rotated hexagonal pattern. The latter becomes increasingly dense, and eventually dominant, towards higher potentials. This microscopically nonuniform (or spatially modulated) phase is noteworthy as well as unusual; the corresponding iodine phases on Au(111) and (110) display, as is common, structural uniformity at a given potential. DTIC

SCANNING TUNNELING MICROSCOPY AND INFRARED SPECTROSCOPY AS COMBINED IN-SITU PROBES OF ELECTROCHEMICAL ADLAYER STRUCTURE: CYANIDE ON Pt(111)
Christopher Stuhlmann, Ignacio Villegas, and Michael J. Weaver Feb. 1994 17 p
(Contract N00014-91-J-1409)
(AD-A276715; TR-147) Avail: CASI HC A03/MF A01

The spatial structure of irreversibly adsorbed cyanide adlayers on a Pt(111) electrode is deduced by means of in-situ scanning tunneling microscopy (STM) combined with infrared reflection-absorption spectroscopy (IRAS). The latter data suggests atop-like Pt-CN coordination. The STM images display a (2 sq rt of 3 x 2 sq rt of 3)R30 degree-7CN structure, with cyanides bound in symmetric atop sites surrounded by hexagonal clusters of CN, likely bound in near-atop sites. This arrangement, stable over the applied potential range -0.5 to 0 V vs SCE, gives way to a (2 x 2) structure and disordered adlayers at lower potentials. These findings are compared with previous structural information deduced from ex-situ electron diffraction. DTIC

N94-33275# Purdue Univ., West Lafayette, IN. Dept. of Chemistry.
NANOSCALE STRUCTURAL CHANGES UPON ELECTROOXIDATION OF Au(111) AS PROBED BY POTENTIODYNAMIC SCANNING TUNNELING MICROSCOPY
Xiaoping Gao and Michael J. Weaver Feb. 1994 15 p
(Contract N00014-91-J-1409)
(AD-A276780; TR-146) Avail: CASI HC A03/MF A01

Understanding the surface structural changes associated with, and resulting from, the electrochemical formation and removal of oxide films is of broadbased practical as well as fundamental importance. These reports chiefly involve STM imaging at a series of fixed potentials, either before and after voltammetric formation and removal of oxide layers, or additionally at suitable high electrode potentials so that surface oxide is present. Evident are several characteristic oxide-induced changes in surface morphology, including the formation of monolayer pits and related metal corrosion, disordering, and roughening. Of the unanswered questions, a central issue concerns the links between surface structural changes and the much discussed voltammetric features for the initial oxidation of ordered gold electrodes. DTIC

DEVELOPMENT OF MATERIALS FOR SPECTRAL HOLE BURNING APPLICATIONS Final Report, 16 Jun. 1993 - 15 Feb. 1994
Chandra P. Khattak, John A. Lesiczka, and Frederick Schmid 28 Feb. 1994 27 p
(Contract F49620-93-C-0035)
(AD-A278408; AFOSR-94-0242TR) Avail: CASI HC A03/MF A01

It was intended to evaluate growth of europium-doped yttrium aluminum oxide (Eu:Y3Al5O12, Eu:YAG) and europium-doped yttrium silicate (Eu:Y2SiO5, Eu:YSO) crystals to characterize these crystals for spectral hole burning application. After technical discussions at a topical workshop and agreement of the Technical Monitor, the scope of the program was enlarged to include growth of rare-earth doped mixed-oxide crystals and growth of Eu:YSO was de-emphasized as these crystals were available for characterization. The experimental effort involved producing YAG, YSO, and YAlO3 (YALO) host crystals and the dopants Eu, Tm, Tb, and Ce. High optical quality crystals of Eu:YAG, Tm:YAG, Tb:YAG, and Ce:YAG were fabricated from 6 cm diameter boules grown using the heat exchanger method (HEM). The samples were characterized for absorption as a function of wavelength at SRI International, Menlo Park, CA. Previously grown Ce:Gd3Sc2Al3O12 (Ce:GSAG) crystal was also characterized. The available data is insufficient for choosing a crystal for spectral hole burning application. It is necessary to explore other rare-earth doped mixed oxide crystals and carry out more characterization. DTIC

Since its synthesis in the 1920s by Goldschmidt, gallium arsenide has received much attention in the last few decades. In the mid-1980s, GaAs technology finally matured into the age of production. We saw a boom of companies dedicated to the growth of GaAs materials and the fabrication of GaAs devices and integrated circuits. Although GaAs is no longer being considered a general purpose material like silicon, it is now well established in several niche markets, such as direct broadcast satellite, microwave monolithic integrated circuits, and optoelectronics. Using photoluminescence (PL) excitation spectroscopy we measured trapping times and recombination times in stepped QW's and coupled QW's and related the results to the wavefunction/interface overlaps. Continuous wave PL excitation spectra of multiple narrow-stepped QW's at room temperature have been measured for the first time. It has been observed that PL intensity increases stronger than as a square of the excitation intensity, and we have attributed this phenomenon to the intricate blend of the radiative recombination between free carriers with the nonradiative recombination on the saturable interface traps. Using the CW PL data only, we have managed to measure both the trapping efficiency and ratio between electron and hole radiative and nonradiative decay times. The result of this research were published in the two separate articles in the Applied Physics Letters 2,4,8 and presented at international conferences 11-13. DTIC

An infinite number of topological conformal algebras with varying central charges are explicitly shown to be present in 2d gravity (treated both in the conformal gauge and in the light-cone gauge) coupled to minimal matter. The central charges of the underlying N = 2 theory in two different gauge choices are generically found to be different. The physical states in these theories are briefly discussed in the light of the N = 2 superconformal symmetry. DOE

The undercooling of liquid metals is a fairly common observation, but the amount of undercooling is usually limited by the action of heterogeneous catalysts. When a liquid is subdivided into a fine droplet dispersion in order to isolate nucleation catalysis, substantial undercooling may be observed before the onset of solidification, as demonstrated by the increased undercooling limits established in the current work. At high undercooling, the solidification of alloys can result in the suppression of the usual crystallization reactions and in the formation of nonequilibrium phases with distinct and novel microstructures. A number of processing variables have been established to control undercooling including: droplet size, melt superheat, cooling rate, and droplet surface chemistry. The application of thermal analysis together with x-ray diffraction and microstructural examination methods has allowed for an evaluation of the kinetic competition during phase selection, for the determination of the decomposition and melting temperatures of metastable phases, and for the assessment of metastable phase diagrams. New advances have also been made in the understanding and control of heterogeneous nucleation and in probing the thermal history of rapidly solidifying samples by upquenching studies as well as in the development of new experimental capacity to study composites. The understanding developed from droplet undercooling studies has a direct application to Rapid Solidification Processing (RSP) and allows for an assessment of RSP treatment in terms of the influence of undercooling and metastable phase equilibria on phase selection and novel solidification microstructure development. The basic information that droplet studies yield also has a broad application to many aspects of solidification processing. DTIC

The notion of entropy is introduced from its historical origins in physics: thermodynamics, statistical physics, quantum physics. Information theoretic versions of this concept are presented, along with mathematical attempts to build entropy on solid bases. This allows a convenient framework for the control of digital picture processing algorithm (to be presented in part 2) to be introduced. ESA

TAMING CHAOTIC CIRCUITS Ph.D. Thesis
Elizabeth Bradley 1992
Avail: Issuing Activity (MIT Libraries, Rm. 14-0551, Cambridge, MA 02139-4307)

The program 'Perfect Moment' is built around a collection of techniques. Given a differential equation, a control parameter, and two state-space points, the program explores the system's behavior, automatically choosing interesting and useful parameter values and constructing state-space portraits at each one. It then chooses a set of trajectory segments from those portraits, uses them to construct a composite path between the objectives, and finally causes the system to follow that path by switching the parameter value at the segment junctions. Rules embodying theorems and definitions from nonlinear dynamics are used to limit computational complexity by identifying areas of interest and directing and focusing the mapping and search on these areas. Reference trajectories found by this design tool exhibit a variety of interesting and useful properties. 'Perfect Moment' balances an inverted pendulum by 'pumping' the device up, over half a dozen cycles, using roughly one-sixth the torque that a traditional linear controller would exert in this task. In another example, the program uses a detour through a chaotic zone to stabilize a system about 300 times faster than would happen by waiting long enough for the system to reach a regime where traditional control methods obtain. Chaotic zones can also be used to steer trajectories across boundaries of basins of attraction, effectively altering the geometry and the convergence properties of the system's stability regions. An externally-induced chaotic attractor that overlaps the phase-locked loop's original lock range is demonstrated here;

the controller designed by the program uses this feature to extend the capture range out to the original lock range limits, allowing the circuit to acquire lock over a wider range of input frequencies than would otherwise be possible. Dissert. Abstr.

COMPRESSIBLE CONVECTION WITH IONIZATION Ph.D. Thesis
Mark Peter Rast 1992 321 p
Avail: Univ. Microfilms Order No. DA9318125

The influence of non-ideal effects associated with ionization upon the dynamics and thermodynamics of compressible convection is studied. Ionization causes changes in the particle number density, internal energy, specific heat and opacity of a fluid. The effects of the first three of these are studied with a simplified model involving pure hydrogen fluid. Linear and finite-amplitude analyses and fully nonlinear two-dimensional simulations are undertaken, with the numerical simulations performed on the massively parallel Connection Machine CM-2. Opacity effects are examined by analyzing solutions obtained from more realistic three-dimensional simulations of solar granulation carried out by Nordlund and Stein. Ionization effects are expected to influence the dynamics of granulation and acoustic mode excitation in the Sun and other stars, and likewise the coupling of convection with pulsations that occurs in stars such as white dwarfs and Cepheid variables. Both the global transport properties and the local dynamical properties of convective flows are affected by ionization. In regions of partial ionization, the enthalpy flux is dominated by latent heat transport. Strong temperature fluctuations and corresponding buoyancy forces develop wherever rapid changes in ionization state occur. These can result in narrow regions of intense vertical flow. The flow asymmetries reported in compressible ideal gas convection can either be enhanced or diminished depending on the vertical positioning of the partially ionized region within the domain. Ionization-induced variations in the radiative properties of a convecting fluid can result in thermal boundary layer instability and plume formation. The interval between plume formation events depends on the growth rate of the instability, the scale of the underlying convective motions and the phase speed of the perturbation. As plumes formed in the upper boundary layer descend, buoyancy forces remain significant as long as heat exchange and compressional heating result primarily in ionization of the fluid rather than in temperature equilibration. This can lead to supersonic vertical flows in an otherwise subsonic flow field, and can serve to excite acoustic oscillations, the phase of which can be abruptly altered by subsequent plume events. In the three-dimensional simulations, significant entrainment of surrounding fluid with depth gradually weakens the sheets and plumes of fast downflow. Dissert. Abstr.

PERTURBATIVE ASPECTS OF LOWER-DIMENSIONAL GAUGE THEORIES Ph.D. Thesis
Brian John Hand Jul. 1993 115 p
(ISBN-0-315-86269-6; CTN-94-61188) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The appearance of a chiral anomaly in the nonlocal regularization scheme is illustrated in the analysis of the two-dimensional chiral Schwinger model. The nonexistence of a measure factor necessary to preserve gauge invariance of the regularized theory is explicitly demonstrated. The one-loop vacuum polarization tensor in three dimensional quantum electrodynamics (QED3) is evaluated using analytic and nonlocal regularization. Both techniques are shown to yield gauge invariant results. The results are compared to those obtained using other regularization methods. A similar analysis is then performed on non-Abelian Chern-Simons theory, and it is found that there is no renormalization of the Chern-Simons parameter. The mass-shell behavior of the fermion propagator in massless QED3, a confining theory, is examined. A technique developed for ordinary four dimensional quantum electrodynamics is applied in which the charged asymptotic states in the theory are dressed with soft vector bosons in order to improve the representation of the infrared dynamics in perturbation theory. The resulting modification to the mass-shell behavior of the fermion propagator is determined with the result that the propagator no longer possesses a mass-shell singularity. Author (CISTI)

NON-EQUILIBRIUM ELECTRODYNAMICS IN THE LARGE N EXPANSION
E. Mottola 1994 18 p Presented at the Third Thermal Field Theories Workshop, Alberta, Ontario, 15-28 Aug. 1993
(Contract W-7405-eng-36)
(DE94-006156; LA-UR-94-381; CONF-9308211-1) Avail: CASI HC A03/MF A01

An effective action technique for the time evolution of a closed system consisting of a mean field interacting with charged fluctuations is presented, and applied specifically to Quantum Electrodynamics. The effective action of QED is first developed in a systematic expansion in 1/N where N is the number of distinct fermion species. Then by making use of the Schwinger-Keldysh closed time path (CTP) formulation of field theory, causality of the resulting equations of motion is ensured. In QED, this technique may be used to study the quantum non-equilibrium effects of pair creation in strong electric fields and the scattering and transport processes of a relativistic e(+)e(-) plasma. Numerical results for these processes in lowest order are presented. The renormalization procedure, connection to quantum transport theory and extension to QCD and other applications of the method are also discussed. DOE

NEW QCD RESULTS FROM STRING THEORY
Z. Bern (California Univ., Los Angeles.), L. Dixon, and D. A. Kosower Nov. 1993 8 p Presented at the 1993 International Conference on Strings, Berkeley, CA, 24-29 May 1993
(Contracts DE-AC03-76SF-00515; DE-FG03-91ER-40662)
(DE94-005226; SU-SLAC-PUB-6388; CONF-9305317-1) Avail: CASI HC A02/MF A01

We discuss new results in QCD obtained with string-based methods. These methods were originally derived from superstring theory and are significantly more efficient than conventional Feynman rules. This technology was a key ingredient in the first calculation of the one-loop five-gluon amplitude. We also present a conjecture for a particular one-loop helicity amplitude with an arbitrary number of external gluons. DOE

THE KALUZA-KLEIN APPROACH AND GAUGE SUPERSYMMETRY Ph.D. Thesis [APPROCHE KALUZA-KLEIN ET SUPERSYMETRIE DE JAUGE]
Jean-Pierre Pare Dec. 1992 120 p In FRENCH
(ISBN-0-315-86553-9; CTN-94-61212) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A non-Abelian gauge supersymmetric Kaluza-Klein approach is presented for charged spinning particles and strings in a background of gravitational and Yang-Mills fields. The classical Kaluza-Klein approach is first generalized for a spinning particle. The spin is described by Grassmannian variables added to the principal bundle. This super symmetrization gives rise to a fermionic non-Abelian charge in addition to the bosonic one. This leads to a search for a supergroup action on the superprincipal bundle which leaves invariant the action of the spinning particle. The invariance of this action would lead to the conservation of a non-Abelian supercharge, generalizing the conservation law obtained for particles without spin. Lagrangian and Hamiltonian formulations are presented and the equations of motion are derived and discussed. The invariance of these formulations under a supergroup action leads to a conservation law of a non-Abelian supercharge. The bosonic part of this supercharge corresponds to the non-Abelian (bosonic) charge obtained for a particle without spin. The fermionic part is a non-physical charge. In the supersymmetric case, this decouples from all other dynamical variables and does not influence trajectories of spinning particles. These formulations are then extended for spinning strings.

TENSOR GAUGE POTENTIALS IN LOOP SPACE FORMULATION OF YANG-MILLS FIELDS
C. Hong-Mo, J. Faridani, and T. S. Tsun Nov. 1993 15 p Prepared in cooperation with Oxford Univ., Englan d
(PB94-147147; RAL-93-080) Avail: Issuing Activity (National Technical Information Service (NTIS))

It is shown that an antisymmetric rank-two tensor gauge potential of the type first found in string and supersymmetry theories occurs also in ordinary Yang-Mills theory when formulated in loop space, where it appears as a Lagrange multiplier for a zero curvature constraint necessary and sufficient for removing the inherent redundancy of loop variables. It is then further shown that the tensor potential acts there as the parallel 'phase' transport for monopoles. NTIS

HEAT TRANSFER STUDIES ON A RECTANGULAR CHANNEL WITH OFFSET PLATE FINS M.S. Thesis
Jeffrey M. Masterson Dec. 1993 49 p
(AD-A277300) Avail: CASI HC A03/MF A01

Convective heat transfer characteristics of a liquid cooled rectangular channel, containing offset plate fins, were investigated experimentally. The selected geometry was a 10x model of the fluid circulation passages in the commercially available SEM-E type electronic cooling modules. The test surface containing fins was made of aluminum and was heated at its base by a thermofoil heater. The Reynolds numbers were varied between 100-800, with water as the cooling fluid. Surface temperature measurements on the heated surface were used to determine the Colburn j factor. The effects of natural convection were also investigated. DTIC

Understanding the physical properties of strongly interacting many-electron systems remains one of the central goals of condensed matter physics. In this project, the authors have developed and implemented numerical techniques, such as quantum Monte Carlo simulations, to study basic models of interacting electrons: the one-band Hubbard model for positive and negative U, the three-band CuO2 Hubbard model, the Holstein electron-phonon model, the periodic Anderson model, and the Kondo lattice. Such models exhibit a rich variety of physical properties. For example, the half-filled Holstein model undergoes a Peierls-charge-density wave transition. While away from half-filling there is competition between superconductivity and the Peierls-charge-density wave phase. The ground state of the half-filled 2D Hubbard model has long-range antiferromagnetic order. Away from half-filling, it has been found to have an attractive interaction in the singlet d(sub x(exp 2)-y(exp 2)) pairing channel, and it provides a model for the high-temperature cuprate superconductors. Similarly, it is believed that the periodic Anderson model and the Kondo lattice model provide a framework for understanding the heavy fermion materials which can exhibit antiferromagnetic and superconducting phases. Because of the strong coupling and the interplay between the different correlations, it is possible to tip these delicately balanced systems in favor of a given correlated state by the approximations one makes. Thus it is important to develop systematic, controlled calculations for these models. Numerical calculations provide an important approach for determining the properties of such models. A review of the work on these problems is presented. DOE

QUANTUM DYNAMICS IN DUAL SPACES
E. C.G. Sudarshan 1993 57 p
(Contract DE-FG03-93ER-40757)
(DE94-008303; DOE/ER-40757/020) Avail: CASI HC A04/MF A01

Quantum mechanics gives us information about spectra of dynamical variables and transition rates including scattering cross sections. They can be exhibited as spectral information in analytically continued spaces and their duals. Quantum mechanics formulated in these generalized spaces is used to study scattering and time evolution. It is shown that the usual asymptotic condition is inadequate to deal with scattering of composite or unstable particles. Scattering theory needs amendment when the interacting system is not isospectral with the free Hamiltonian, and the amendment is formulated. Perturbation theory in generalized spaces is developed and used to study the deletion and augmentation of the spectrum of the Hamiltonian. A complete set of algebraically independent constants for an interacting system is obtained. The question of the breaking of time symmetry is discussed. DOE

SOLGAS REFINED: A COMPUTERIZED THERMODYNAMIC EQUILIBRIUM CALCULATION TOOL
L. D. Trowbridge and J. M. Leitnaker Nov. 1993 80 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract USECHQ-93-C-0001)
(DE94-009021; K/ETO-140) Avail: Issuing Activity (Department of Energy (DOE))

SOLGAS, an early computer program for calculating equilibrium in a chemical system, was made more user-friendly, and several 'bells and whistles' were added. The necessity to include elemental species was eliminated. The input of large numbers of starting conditions was automated. A revised format for entering data simplifies and reduces chances for error. Calculated errors by SOLGAS are flagged, and several programming errors are corrected. Auxiliary programs are available to assemble and partially automate plotting of large amounts of data. Thermodynamic input data can be changed 'on line. The program can be operated with or without a co-processor. Copies of the program, suitable for the IBM-PC or compatible with at least 384 bytes of low RAM, are available from the authors. DOE

PHYSICS OF HEAT PIPE REWETTING Final Technical Report, 1 Apr. 1991 - 31 Jan. 1994
S. H. Chan 1994 16 p
(Grant NAG9-525)
(NASA-CR-195902; NAS 1.26:195902) Avail: CASI HC A03/MF A01

This is the final report which summarizes the research accomplishments under the project entitled 'Physics of Heat Pipe Rewetting' under NASA Grant No. NAG 9-525, Basic, during the period of April 1, 1991 to January 31, 1994. The objective of the research project was to investigate both analytically and experimentally the rewetting characteristics of the heated, grooved plate. The grooved plate is to simulate the inner surface of the vapor channel in monogroove heat pipes for space station design. In such designs, the inner surface of the vapor channel is threaded with monogrooves. When the heat pipe is thermally overloaded, dryout of the monogroove surface occurs. Such a dryout surface should be promptly rewetted to prevent the failure of the heat pipe operation in the thermal radiator of the space station. Author

This is an edition of 'NASA Report to Education' covering NASA's Educational Workshop, Lewis Research Center's T-34 and the Space Exploration Initiative. The first segment shows NASA Education Workshop program (NEWEST - NASA Educational Workshops for Elementary School Teachers). Highlights of the 14 days of intense training, lectures, fieldtrips and simple projects that the educators went through to teach the program are included. Participants are shown working on various projects such as the electromagnetic spectrum, living in Space Station Freedom, experience in T-34, tour of tower at the Federal Aviation Administrative Facilities, conducting an egg survival system and an interactive video conference with astronaut Stori Musgrave. Participants share impressions of the workshop. The second segment tells how Lewis Research Center's T-34 aircraft is used to promote aerospace education in several Cleveland schools and excite students. CASI

DRUG-RELATED PROBLEMS IN THE WORKPLACE
A. Guppy Jun. 1993 20 p
(Cranfield-Aero-9306; ISBN-1-871564-61-1; ETN-94-96069) Avail: CASI HC A03/MF A01; Cranfield Univ. of Technology, Coll. of Aeronautics, Cranfield, Bedford MK43 0AL, England, HC

The introduction of workplace policies and procedures to minimize the existence of problems associated with substance use, which has become widespread among certain western nations over the last two decades, is considered. There is general agreement that the primary goal of such activities should be to minimize the effects on measures such as absenteeism, lost productivity, safety and health care costs that are seen as associated with substance misuse by employees. The evidence that significant associations exist between certain patterns of drug use and workplace problems within the safety and productivity domains is reviewed. An outline of relevant countermeasure alternatives is provided as well as some information concerning current trends in intervention within British based organizations. One of the aspects of workplace intervention that has received considerable attention in recent years concerns drug testing. There would appear to be much debate about the legal and ethical implications of certain drug testing programs, particularly where countries are perceiving pressure to require testing following the use of such procedures in the U.S. (Ontario Law Reform, 1992). For this reason a very brief review of drug testing programs is provided. ESA

PLANNING OF AIR CREW SCHEDULES M.S. Thesis [PLANIFICATION D'HORAIRES D'EQUIPAGES AERIENS]
Raphael Tcheune Sep. 1992 125 p In FRENCH

(ISBN-0-315-86506-7; CTN-94-61204) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Air crew schedule planning is important for reducing the operating costs of an airline. Planning these schedules must take into account such constraints as flight schedules, type of aircraft, location of flight departure and arrival, length of flight, crew fatigue, and regulations and agreements on crew working conditions. A scheduling optimization program has been developed for planning crew rotations for Air France which performs the scheduling in accordance with the company's present collective agreement. A study was conducted of a system for planning air crew schedules for Air France, following the regulations negotiated for the European market. The scheduling problem is formulated mathematically and relevant literature is reviewed. The method chosen for solving the scheduling problem uses the column generation principle and GENCOL software, which is for solving shortest path problems with constraints on an adequately constructed network. Two network models are developed in which the tasks to be done are disposed on arcs, each arc having resources which characterize the task and which must be consumed when the task is accomplished. The two models are tested on four data sets having 109, 218, 588, and 739 flight segments. The results obtained are satisfactory from the point of view of calculation time and quality of crew rotations. CISTI

NASA STRATEGIC PLAN

May 1994 27 p
(NASA-TM-109780; NAS 1.15:109780) Avail: CASI HC A03/MF A01

The NASA Strategic Plan is a living document. It provides far-reaching goals and objectives to create stability for NASA's efforts. The Plan presents NASA's top-level strategy: it articulates what NASA does and for whom; it differentiates between ends and means; it states where NASA is going and what NASA intends to do to get there. This Plan is not a budget document, nor does it present priorities for current or future programs. Rather, it establishes a framework for shaping NASA's activities and developing a balanced set of priorities across the Agency. Such priorities will then be reflected in the NASA budget. The document includes vision, mission, and goals; external environment; conceptual framework; strategic enterprises (Mission to Planet Earth, aeronautics, human exploration and development of space, scientific research, space technology, and synergy); strategic functions (transportation to space, space communications, human resources, and physical resources); values and operating principles; implementing strategy; and senior management team concurrence.

AGILE TOTAL QUALITY GUIDELINES FOR ENHANCING TEAMWORK AND SUCCESS

D. D. Brayton and R. R. Harris Aug. 1993 17 p Presented at the 48th Annual Quality Congress, Las Vegas, NV, 24-26 May 1994
(Contract DE-AC06-87RL-10930)
(DE93-019972; WHC-SA-2050; CONF-940538-1) Avail: CASI HC A03/MF A01

Companies implement total quality Programs to enable them to obtain performance leadership in meeting their business objectives. The successful corporations reach energy level of the corporate structure and change the overall culture of their operations. Limited success occurs when companies advocate total quality programs (e.g., high-powered training classes, tools and gimmicks), but are only partially effective in changing the culture of the work force. The ability to reach the 'grassroots' level employees with a total quality program effort is vital in changing the overall culture. First-line management, i.e., both project and supervisory leaders, must direct the total quality program effort. First-line management needs well defined guidelines (beyond the general company guidelines) for implementing a total quality program. Guidelines that allow the establishment of an agile total quality Program, which support upper management total quality program directives, yet are modifiable for their specific needs. The guidelines presented in this paper empower employees and improve the culture of the work environment through defined goals and teamwork to achieve success. DOE

TOTAL QUALITY MANAGEMENT IMPLEMENTATION GUIDELINES

Dec. 1993 73 p
(DE94-007232; DOE/HR-0066) Avail: CASI HC A04/MF A01

These guidelines were designed by the Energy Quality Council to help managers and supervisors in the Department of Energy Complex bring Total Quality Management to their organizations. Because the Department is composed of a rich mixture of diverse organizations, each with its own distinctive culture and quality history, these guidelines are intended to be adapted by users to meet the particular needs of their organizations. For example, for organizations that are well along on their quality journeys and may already have achieved quality results, these guidelines will provide a consistent methodology and terminology reference to foster their alignment with the overall energy quality initiative. For organizations that are just beginning their quality journeys, these guidelines will serve as a startup manual on quality principles applied in the energy context. DOE

ACQUISITION INFORMATION MANAGEMENT SYSTEM TELECOMMUNICATION SITE SURVEY RESULTS

K. A. Hake and B. G. Key Sep. 1993 39 p
(Contract DE-AC05-84OR-21400)
(DE94-005688; ORNL/TM-12112) Avail: CASI HC A03/MF A01

The Army acquisition community currently uses a dedicated, point-to-point secure computer network for the Army Material Plan Modernization (AMPMOD). It must transition to the DOD supplied Defense Secure Network 1 (DSNET1). This is one of the first networks of this size to begin the transition. The type and amount of computing resources available at individual sites may or may not meet the new network requirements. This task surveys these existing telecommunications resources available in the Army acquisition community. It documents existing communication equipment, computer hardware, associated software, and recommends appropriate changes. DOE

TRANSFORMATION OF DATABASE POPULATIONS AND OPERATIONS FROM THE CONCEPTUAL TO THE INTERNAL LEVEL
P. vanBommel, G. Kovacs, and A. Micsik 9 Nov. 1992 20 p Sponsored in part by Trans-European Mobility Scheme for European Communities Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(TR-92-27; ETN-94-95615) Avail: CASI HC A03

A framework for the automatic transformation of databases from the conceptual to the internal level is described. The approach fits in with the ANSI/SPARC three level architecture for database management systems. The framework consists of three components: structures (database schemata), populations (database contents) and operations (database manipulations). These components are described for modeling techniques, such as ER, NIAM and the Binary Relationship Model. On the internal level focus is on (nested) relational models. For each component on the conceptual level a separate transformation is provided to the internal level. The components are integrated by a central notion: the predicator. Further integration is obtained by means of basic population rules. ESA

PUTTING THE INFORMATION INFRASTRUCTURE TO WORK: REPORT OF THE INFORMATION INFRASTRUCTURE TASK FORCE COMMITTEE ON APPLICATIONS AND TECHNOLOGY
May 1994 116 p
(NIST/SP-857; ISBN-0-16-043188-3) Avail: CASI HC A06/MF A02; SOD

The Committee on Applications and Technology of the Information Infrastructure Task Force is charged with coordinating efforts to develop, demonstrate, and promote applications of information technology in several diverse areas and to develop and recommend technology strategies and policy to accelerate the implementation of the National Information Infrastructure (NII). The goal of this document is to focus the public debate on the uses of the NII and the benefits of advanced computing and communications technologies. Seven applications papers are presented which address manufacturing, electronic commerce, health care, education and lifelong learning, environmental monitoring, libraries, and government service delivery. In each of these papers a description of the application arena is given along with a summary of the current information technology uses, short and long term goals, and issues related to how these goals could be achieved. AN ANALYSIS OF THE RECORDS MANAGEMENT PROCESS TO DETERMINE THE IMPACT OF AUTOMATION ON PRODUCTIVITY M.S. Thesis
David A. Gaines and Trevor J. Nelson Dec. 1993 107 p
(AD-A275923; AFIT/GSS/LAR/93D-4) Avail: CASI HC A06/MF A02

This research was performed to study the effects of automation on Air Force records management productivity prior to widespread implementation of Document Librarian. Document Librarian is a software tool developed for Headquarters Air Force Materiel Command (HQ AFMC) to manage records in accordance with Air Force, Federal, and National Archives and Records Administration (NARA) regulations, and is currently undergoing developmental testing. One organization was used as a case study to determine the effects of Document Librarian on the organization's records management productivity. A records management process model was constructed and used to define the relevant tasks and outputs of their records management process. Administrative productivity indicators (API's), a productivity measuring technique, was then used to determine a measure of productivity for the tasks defined by the model. The results showed approximately a 30 to 31 percent increase in the records technician's productivity when records were managed with Document Librarian. DTIC

DOD INFORMATION SYSTEMS CAPACITY MANAGEMENT FUNCTION Final Report
Charles A. Archer, Sr. 16 Nov. 1993 190 p
(AD-A275987) Avail: CASI HC A09/MF A02

This report provides the foundation and structure for development of policy for a Department of Defense (DoD) information systems capacity management (CM) function. The objective in this workshop was to provide a DoD-wide standard framework for conducting performance measurement and capacity planning activities across all defense information infrastructure (DII), information systems (IS), and configurations (i.e., mainframe/host computers, communication systems, and networks). In many ways, the activities described in this document are similar to collective CM processes used in the DoD today, primarily for mainframe environments. However, the processes modeled in this report were constructed as the 'best practices' of all approaches to capacity management, and have been extended to include all DoD communication and network systems. DETECTING THE EROSION OF HIERARCHIC INFORMATION STRUCTURES
P. D. Bruza (Nijmegen Univ., Netherlands.), T. W. C. Huibers, J. vanderLinden, and T. vanOpstal Mar. 1993 17 p
(ISSN 0924-3275)
(RUU-CS-93-10; ETN-94-95647) Avail: CASI HC A03/MF A01

The problem of detecting erosion in hierarchical information structures is studied. This problem manifests itself particularly in environments where there is little or no possibility to guarantee structures in accordance with a specification and furthermore where there is a high frequency of mutation of structures. The notion of information structure is formalized in terms of so called structural expressions. The erosion of information structures is paralleled by increased optionality in the associated structural expressions. In order to detect erosion the 'choice normal form' for structural expressions is introduced. In this normal form all implicit optionality is made explicit. It is shown how arbitrary structural expressions can be brought into the normal form via transformations which are semantic preserving. A graphical formalism is presented whereby analysis of erosion is made more convenient. ESA

THE MEANING OF DUPLICATES IN THE RELATIONAL DATABASE MODEL
Karen L. Kwast and Sieger vanDenneheuvel May 1993 53 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0928-3323)
(CT-93-04; ETN-94-96009) Avail: CASI HC A04

The relational database model is defined in terms of sets, whereas SQL needs the distinct option of explicit duplicate removal. The underlying concept of duplicate tuples is defined, the operators of the relational algebra are generalized, and the connection with logic is studied. It is shown that 'baggy' operators are neither classical nor linear. The generalized system is applied in a formal interpretation of SQL. ESA

INFORMATION ACQUISITION FROM MULTI-AGENT RESOURCES; ABSTRACT

Zhisheng Huang and Peter vanEmdeBoas 26 Aug. 1993 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0928-3307)

(LP-93-08; ETN-94-96000) Avail: CASI HC A03

The possibilities and impossibilities of strategies for dealing with the 'Judge puzzle' problem are investigated. Those situations where information can be combined without risking the undesirable situation that a derivable proposition contradicts the beliefs of all agents involved are characterized: the relevant notion is called absolute safety. It turns out that in that case only trivial solutions exist. It follows that any nontrivial strategy must use information about the epistemic states of the agents involved. Less restrictive notions of safety are investigated. The more interesting of these notions are those which involve not only propositions about the world but also epistemic information relating the knowledge of the various agents involved. For this purpose, the logic of belief dependence is used. The results characterizing the generalized safety notions generalize for this extended logic. A notion of almost safety within this framework which describes the safety of combining information under the hypothesis that agents eventually might have exchanged their information among themselves is presented. For this notion of almost safety an explicit solution to the Judge puzzle is given. ESA

MANAGING CUSTOMER ORDER DRIVEN ENGINEERING. AN INTERDISCIPLINARY AND DESIGN ORIENTED APPROACH

D. R. Muntslag 1993 255 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(PB94-145083; ISBN-90-386-0251-0) Copyright Avail: CASI HC A12

This thesis addresses a specific subset of production situations, namely, the engineer-to-order plants which produce industrial equipment. This type of production plant is concerned with the engineering and production of complex industrial equipment to fill specific customer orders. These plants operate in a market which can be characterized as being extremely dynamic and erratic. The research described deals with the control of a nonphysical process, the customer order driven engineering which precedes the physical production of a product. Important decisions are made during this nonphysical phase which have a significant effect upon the performance of the whole company. NTIS

EFFECTIVE INFORMATION MODELLING SUPPORT Ph.D. Thesis

T. F. Verhoef 28 Jun. 1993 291 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(PB94-148236; ISBN-90-9006176-2) Avail: Issuing Activity (National Technical Information Service (NTIS))

To get a detailed insight, both in prescribed and applied modeling knowledge, especially in similarities and differences between prescribed and applied modeling knowledge, the authors perform an extensive investigation. In chapter 2, the authors present the approach they use to acquire and represent both prescribed and applied modeling knowledge. The results of applying their approach are presented in the three subsequent chapters. Chapter 3 deals with prescribed modeling knowledge, while chapters 4 and 5 are involved with representing applied modeling knowledge. Chapter 6 discusses conclusions, both on similarities and differences between prescribed and applied modeling knowledge. Based on these conclusions, they propose a model for effective information modeling support in chapter 7. The chapter also shows some applications. In chapter 8, the findings are evaluated. NTIS

ON THE VALIDITY OF THE BLP MODEL

Edo Roos Lindgreen 1993 25 p

(Contract TGP92037) (ISSN 0922-5641)

(Rept-93-70; ETN-94-96115) Copyright Avail: CASI HC A03/MF A01

The Bell-LaPadula (BLP) model, a model for multilevel secure computer systems, plays a pivotal role in the trusted computer systems evaluation criteria (TCSEC). A limited though systematical attempt to investigate the validity of the BLP model, taking the model's original and current context into account, is presented. While the original model appears to be based on indefinite and sometimes questionable assumptions, it is argued that the current model must be considered invalid for its application in practice. ESA

COMPILER TECHNIQUES FOR MANAGING DATA MOTION Ph.D. Thesis
John S. Pieper Dec. 1993 162 p
(Contract MDA972-90-C-0035; ARPA Order 7330)
(AD-A276514; CMU-CS-93-217) Avail: CASI HC A08/MF A02

Software caching, automatic algorithm blocking, and data overlays are different names for the same problem: compiler management of data movement throughout the memory hierarchy. Modern high-performance architectures often omit hardware support for moving data between levels of the memory hierarchy: iWarp does not include a data cache, and Cray supercomputers do not have virtual memory. These systems have effectively traded a more complicated programming model for performance by replacing a hardware-controlled memory hierarchy with a simple fast memory. The simpler memories have less logic in the critical path, so the cycle time of the memories is improved. For programs which fit in the resulting memory, the extra performance is great. Unfortunately, the driving force behind supercomputing today is a class of very large scientific problems, both in terms of computation time and in terms of the amount of data used. Many of these programs do not fit in the memory of the machines available. When architects trade hardware support for data migration to gain performance, control of the memory hierarchy is left to the programmer. Either the program size must be cut down to fit into the machine, or every loop which accesses more data than will fit into memory must be restructured by hand. This thesis describes how a compiler can relieve the programmer of this burden and automate data motion throughout the memory hierarchy without direct hardware support. DTIC

LIFTING THE FOG OF CORPORATE INFORMATION MANAGEMENT Research Report, Aug. 1992 - Apr. 1993
Charles D. Miller Apr. 1993 49 p
(AD-A276680; NDU-ICAF-93-F22A) Avail: CASI HC A03/MF A01

Corporate information management (CIM) is a very complex, multifaceted program which is being implemented in the Department of Defense. It is so broad and all encompassing that it appears more as a vision than a program. The intent is to operate DOD like a business enterprise, by streamlining how we do business and then implementing state-of-the-art information technology. CIM will impact every facet of DOD, from administrative support to the 'warfighter' in combat. This paper takes a broad look at CIM from a layman's perspective and provides a simplified explanation of the program. DTIC

EXPERIENCES WITH EDO: AN EVOLUTIONARY DATABASE OPTIMIZER
Patrick VanBommel 14 Jul. 1993 19 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(TR-93-23; ETN-94-96216) Avail: Issuing Activity (European Space Agency (ESA))

The database design tool EDO (Evolutionary Database Optimizer) is introduced. The term 'evolutionary' refers to a basic feature of the tool. After generating an initial pool of preliminary internal representations for a given conceptual data model, EDO allows a database designer to activate evolution strategies, modifying the preliminary internal representations into more desirable ones. The quality of the internal representations found as yet is used to perform a guided walk through the solution space of alternative internal representations for the conceptual model under consideration. This quality (called fitness) takes into account the expected storage space and the expected average response time of a candidate internal representation. ESA

UNTYING THE GORDIAN DATA KNOT. A PAPER ON INFORMATION ENGINEERING (IE) AND CORPORATE INFORMATION MANAGEMENT (CIM) Report, Aug. 1992 - Apr. 1993
William F. Reyers Apr. 1993 37 p
(AD-A276862; NDU-ICAF-93-F22) Avail: CASI HC A03/MF A01

DOD must find the best way to transition the data in its legacy and migration systems which today are integrated into a gigantic gordian knot. The Defense Information Systems Agency (DISA) provided the above assessment in September 1992 as part of the DOD status report on the CIM initiative. This assessment succinctly identified the major challenge for CIM. The current data in DOD systems must transition to the future DOD systems. DOD has selected the Information Engineering approach to accomplish this data transition. As such, Information Engineering and its associated data standardization processes become the pacing factors for the successful implementation of CIM. With the success of CIM totally dependent on data standardization, it is important that we understand this effort, the progress to date, and the probability for ultimate success. This paper explores CIM and Information Engineering and discusses several impediments that can hinder CIM if left unaddressed. The paper also contains an alternative to the current data standardization process underway. DTIC

AN INFORMATION SYSTEM ORGANIZED AS STRATIFIED HYPERMEDIA
C. A. J. Burgers, H. A. Proper, and T. P. vanderWeide 5 Jul. 1993 21 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(TR-93-12; ETN-94-96209) Avail: Issuing Activity (European Space Agency (ESA))

The integration between stratified hypermedia architecture and information systems is addressed. A relation between modern hypertext approaches and conventional data modeling techniques, such as PSM (Predicator Set Modeling), is investigated. This relation provides the mechanism of query by navigation, in order to facilitate the query formulation problem. ESA

EVORM: A CONCEPTUAL MODELLING TECHNIQUE FOR EVOLVING APPLICATION DOMAINS
H. A. Proper and T. P. vanderWeide Jul. 1993 29 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(TR-93-16; ETN-94-96210) Avail: Issuing Activity (European Space Agency (ESA))

EVORM, a modeling technique for evolving application domains is presented. A delimitation of the concept of evolution is provided, based on an earlier developed general theory for such evolutions. This theory makes a distinction between the underlying information structure and its evolution on the one hand, and the description and semantics of operations on the information structure and its population on the other hand. Main issues within this theory are object typing, type relatedness and identification of objects. EVORM is the result of applying this general theory to the object role modeling technique PSM (Predicator Set Modeling), a generalization of ER, EER, FORM and NIAM (Natural language Information Analysis Method). DESCRIPTION OF DCS (DATA CONVERTING SYSTEM) AND CT (CONE TOOL). A REPRINT OF A NOTE PUBLISHED IN FIRE AND MATERIALS TITLED FIRE TEST DATA AVAILABLE FOR YOUR PURPOSE
K. Opstad and L. E. Loenvik 25 Jun. 1993 9 p Repr. from Fire and Materials, Chichester, England See also PB93-182038
(PB94-138559; STF25-A93026) Avail: Issuing Activity (National Technical Information Service (NTIS))

The EUREFIC (European Reaction to Fire Classification) has produced a lot of fire test data, which are made available through a Data Converting System (DCS). DCS is a simple PC based program which transfers data logger files into a standard fire test data format, given by FDMS (A Fire Data Management System). DCS can also transfer standard data files into

data formats of common spread sheets. The EUREFIC program has made two models for assessing large scale performance of test materials. These models are integrated into a PC program named CT (Cone Tools). NTIS

THE INTELLIGENT MONITORING SYSTEM: GENERIC DATABASE INTERFACE (GDI). REVISED USER MANUAL Technical Report, 27 Nov. 1991 - 25 Feb. 1994
Jean Anderson, Mari Mortell, Bonnie MacRitchie, and Howard Turner 3 Jan. 1994 140 p
(Contract MDA972-92-C-0026; ARPA Order 6266)
(AD-A277131; SAIC-93/1001) Avail: CASI HC A07/MF A02

The Generic Database Interface (GDI) is a common application programmable to multiple databases, providing two key capabilities: Database access and data management. Database access routines allow an application to connect to and query a database with the same GDI call whether the target database is ORACLE, POSTGRES, or SYBASE. Data to and from the database are managed in the native format of the application, making it possible to provide a seamless integration of application and database. DTIC

THE RELATIONSHIP BETWEEN INTEGRATIVE TASK DESIGN FOR INFORMATION SYSTEMS PROFESSIONALS AND PERCEIVED INFORMATION SYSTEMS EFFECTIVENESS Ph.D. Thesis
Stanley E. Gambill 1992 128 p
Avail: Univ. Microfilms Order No. DA9311442

This dissertation examines the problem of task design for information systems (IS) professionals and investigates the relationship between integrative task design and perceived information systems effectiveness. A conceptual model was developed that integrated important job design factors from expectancy theory, goal setting theory, equity theory, and job characteristics theory. The model proposed that these important job design factors were positively related to perceived information systems effectiveness. One key issue which should be noted is that this study was concerned with perceived effectiveness of the total IS function, not just individual employees or systems. This is a departure from most prior studies dealing with task design. The level of analysis is usually the individual employee and the focus is on the relationship between task design and individual work motivation and performance. A field study was conducted where data was gathered via questionnaires from thirty organizations. Job design factors identified as important by participating organizations included feedback from the job, feedback on goals, goal specificity, employee voice, skill variety, and participation in goal setting. Results of the study also indicate that employee voice, feedback on goals, autonomy, task identity, goal specificity, and participation in goal setting are positively related to perceived information systems effectiveness as measured by hourly users of information systems services. Limitations of the research and practical implications for both IS practitioners and academics are discussed. Several avenues for future research are presented as well. Dissert. Abstr.

RELATIONSHIPS BETWEEN ACCESS AND USE IN INFORMATION SYSTEMS: REMOTE ACCESS TO AND BROWSING OF ONLINE CATALOGS Ph.D. Thesis
Pamela Snelson 1993 118 p
Avail: Univ. Microfilms Order No. DA9320536

Ownership of personal computers, automation of information resources, and installation of campus networks allow increased access to academic information systems. An interesting research question arises: How is accessibility related to the use of information systems? This study examined two groups of online catalog users segregated by their method of access to the online system: access via terminals located in the library or remote workstations connected to the campus network. An online survey collected demographic data, perceptions on source and terminal accessibility, and information on usage, task variety, and search satisfaction. Transaction logs furnished data on browsing behavior, while interviews of both groups of users provided additional information about remote use. Results indicate that remote use of online information systems is comparable to traditional in-library use. There are no statistically significant differences in information source accessibility, browsing, task variety, or satisfaction. However, overall perceptions of accessibility are high for both groups and contribute to subjective satisfaction. Task variety may be a function of accessibility and is also a contributing factor to satisfaction. Since these results do not support the original model, a revised model consonant with the data is proposed. The trends noted above are not limited to libraries and other information centers. Online catalogs are but one application of interactive computer systems. Automated teller machines and shopping via CompuServe are two examples of business transactions that are now conducted from remote sites. When considered in this broader context, online catalog searching is an example of human interaction with computers. Research conducted within the framework of online catalogs will be useful in the larger category of human adaptation to technological innovations. Dissert. Abstr.

A SIMULATION OF UNCERTAIN REASONING ON PARAMETRIC DATABASES USING DATA-DEPENDENCY DERIVED INFERENCE NETS Ph.D. Thesis
Robert E. Eek 1993 183 p
Avail: Univ. Microfilms Order No. DA9320193

Users of parametric databases must achieve high recall and precision (retrieval effectiveness) on pre-existing collections of uncertain data. Such databases, common in the military intelligence community, are used to identify and evaluate such things as radar systems whose characteristics are inherently imprecise and usually only partially known. Existing Boolean queries against such databases cannot reliably retrieve information when, as often occurs, newly observed data fall outside the parameter range limits of a database's records. This research first develops and then simulates a database query methodology that demonstrates high retrieval effectiveness on uncertain parametric data. The query methodology developed in this research addresses two issues necessary to the reliable, effective retrieval of uncertain and incomplete data. First, it provides a method for deriving verifiable argument structure in the form of inference nets using the data dependencies in a database scheme. That method can be used for inductive reasoning on parametric databases. Second, it proposes evidence evaluation methodologies that operate efficiently and reliably in a shared database environment. Two set-theoretic methods, fuzzy sets, and Baconian rough sets are discussed. The simulation applies data dependency derived inference nets and the two evidence evaluation models to parametric databases used by electronics intelligence (ELINT) analysts. The evaluation methods are implemented in a manner appropriate to parametric data ranges that represent statistical compilations of previously observed data values. The simulation compares the retrieval effectiveness of data dependency derived inference nets, one using fuzzy set and the other Baconian evaluation, to that of conventional database queries using Boolean evaluation methods. The data collections and associated observations used by the simulation include data variance where observations exceed recorded range limits. The results of this research demonstrate that database management systems designed for general business applications can support reasoning on uncertain information. The formal inference structuring method of data dependency derived inference nets is applicable to many areas where uncertain information must be processed. Dissert. Abstr.

INFORMATION DISCLOSURE IN EVOLVING INFORMATION SYSTEMS: TAKING A SHOT AT A MOVING TARGET
H. A. Proper and T. P. vanderWeide 17 Sep. 1993 22 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(TR-93-22; ETN-94-96215) Avail: CASI HC A03

A manipulation language for evolving information systems is introduced. Evolving information systems go beyond the capacity of conventional database systems, not only as they incorporate a time dimension, but also since they allow all aspects of the system to evolve. The introduced language is related to the philosophy underlying NIAM (Natural language Information Analysis Method). This method investigates the grammar of the communication in the universe of discourse. Usually this grammar is depicted as an information structure diagram (NIAM or ER schema). The language Elisa-D, which is based on this grammar, is described. Queries in this language have a direct meaning in the universe of discourse, while natural language expressions are easily formalized in this language. ESA

MULTIDIMENSIONAL SCALING OF USER INFORMATION SATISFACTION M.S. Thesis
Synthia S. Jones Dec. 1993 120 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A277230) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The objective of this study was to determine if multidimensional scaling reveals more about user perception of satisfaction with information systems than did factor analysis. Multidimensional scaling shed a different light on information satisfaction data, making them easier to visualize and interpret. While the differences were not substantial between multidimensional scaling and factor analysis, we concluded that the possibility of remarkably new insights gained through multidimensional scaling were well worth the small marginal cost of undertaking the analysis. Multidimensional scaling (MDS) provides an information technology (IT) manager with possible new perspectives in the analysis of user's satisfaction with information and with information systems. The technique probes for meanings locked in user satisfaction data that are not accessible by other analytic procedures. IT managers should be, in all cases, skeptical of contrived hypothesis testing factor analyses that deal with satisfaction data only at its face value. MDS gives managers a tool by which they can identify meanings beyond the obvious. Coupled with the careful and effective use of the semantic differential question format, MDS is a powerful means to escape the fatal flaw in data gathered by survey questionnaires: socially desirable responses. DTIC

MANAGING PERFORMANCE OF DB2 AD HOC REPORTS
A. Chow 1994 9 p Presented at the 4th Annual Conference of the International DB2 Users Group, San Diego, CA, 8-12 May 1994
(Contract DE-AC09-89SR-18035)
(DE94-006669; WSRC-MS-94-029; CONF-940595-1) Avail: CASI HC A02/MF A01

The DB2 financial reporting systems at Westinghouse Savannah River Company consists of 212 standardized reports that over 1034 users have accessed in 1993 to generate their reports. Each report has a range of selection criteria that the users can specify. Depending on the selection criteria, a report can access from a few rows to millions of rows of data. When this new DB2 system went into production in 1992, the CPU was at 100% utilization. From the beginning, ad hoc reports had a backlog of 4-5 days. Since DB2 was a new DBMS, most people blamed the poor report turn around times on DB2 as an inefficient DBMS and on a shortage of CPU cycles. Since we are unable to purchase a more powerful CPU, the only option left to us was to improve report turn around was system and application performance tuning. This document presents our efforts in these areas. Education of users in report submission was a starting point. And as to index tuning techniques that were applied, we created more friendly indexes, used clustering indexes, and used a reorganizing mechanism. A more efficient SQL was written which saved a lot of money. DOE

The United States has aggressively embarked on the challenging task of building a National Information Infrastructure (NII). This infrastructure will have many levels, extending from the building block capital stock that composes the telecommunications system to the multitude of higher tier applications hardware and software tied to this system. This 'White Paper' presents a vision for a second and third tier national information infrastructure that focuses exclusively on the needs of social science, education, and decision making (NII-SSEDM). NII-SSEDM will provide the necessary data, information, and automated decision support and educational tools needed to help this nation solve its most pressing social problems. The proposed system has five components: data collection systems; databases; statistical analysis and modeling tools; policy analysis and decision support tools; and materials and software specially designed for education. This paper contains: a vision statement for each component; comments on progress made on each component as of the early 1990s; and specific recommendations on how to achieve the goals described in the vision statements. The white paper also discusses how the NII-SSEDM could be used to address four major social concerns: ensuring economic prosperity; health care; reducing crime and violence; and K-12 education. Examples of near-term and mid-term goals (e.g., pre-and post Year 2000) are presented for consideration. Although the development of NII-SSEDM will require a concerted effort by government, the private sector, schools, and numerous other organizations, the success of NH-SSEDM is predicated upon the identification of an institutional 'champion' to acquire and husband key resources and provide strong leadership and guidance. INFORMATION SYSTEMS TO ENHANCE TECHNOLOGY EXCHANGE
Tom Hunter, Mark Harrington, Charlene Harlan, and Eugene Drozhko 1994 4 p Presented at the Waste Management 1994, Tucson, AZ, 27 Feb. - 3 Mar. 1994
(Contract DE-AC04-94AL-85000)
(DE94-007744; SAND-93-3967C; CONF-940225-52) Avail: CASI HC A01/MF A01

A fundamental part of international technology exchange is the compilation and dissemination of information. Worldwide environmental problems and technology development activities form the basis for important opportunities across the world and especially for those in the former Soviet Union. Recently, important agreements have been reached among Russian institutes engaged in environmental work and the US Department of Energy (DOE) and its national laboratories. These agreements will allow a systematic compilation of information on environmental contamination problems in Russia that can be included in DOE's environmental information systems. A computer hardware and software system has been loaned to Russian scientists by the DOE for the sharing of environmental software and data, while establishing standards for future information networks. The Electric Vehicle (EV) Site Operator Program is currently composed of thirteen Site Operators. In addition to operating electric vehicles for demonstration of the technology, the Site Operators also perform operational field testing. Data collected by the programs are input to the Site Operator Database at each site and transmitted, periodically, to the database at the INEL. As the program has expanded, some Site Operators have begun operating vehicles at sites remote from their offices. With the advent of these expanded test programs, it is necessary to consider in-vehicle, automated data acquisition systems. Three of these in-vehicle, data acquisition systems have been designed and constructed. The Mobile Data Acquisition System (MDAS) was designed and constructed by Sigma TecSystems, Inc. located in Tampa, Florida. The Versatile Data Acquisition System (VDAS) was designed and constructed at the INEL under the guidance of the Electric and Hybrid Vehicle (EHV) Program. The AUTOLOGGER Vehicle User Survey System produced by Instrumental Solutions of Ottawa, ON. Because the USF MDAS is a new system proposed for use by the Site Operator Program, the purpose of this report is to provide a preliminary evaluation of the MDAS by comparing the system to the proven VDAS. Data used to perform the comparison was acquired by a review of the MDAS literature provided by the USF, and by a demonstration of the MDAS and its performance, provided by the USF to INEL personnel. A brief discussion of the AUTOLOGGER is also included, for comparison, because it is being used by Southern California Edison (SCE), one of the Site Operator Program participants who recommends the unit as a good system. In this paper, the diffusion of federally funded aerospace R&D is explored from the perspective of the information-seeking behavior of U.S. aerospace engineers and scientists. The following three assumptions frame this exploration: (1) knowledge production, transfer, and utilization are equally important components of the aerospace R&D process; (2) the diffusion of knowledge resulting from federally funded aerospace R&D is indispensable for the U.S. to remain a world leader in aerospace; and (3) U.S. government technical reports, produced by NASA and DOD, play an important, but as yet undefined, role in the diffusion of federally funded aerospace R&D. A conceptual model for federally funded aerospace knowledge diffusion, one that emphasizes U.S. goverment technical reports, is presented. Data regarding three research questions concerning the information-seeking behavior of U.S. aerospace engineers and scientists are also presented. Author (revised)

With its contribution to trade, its coupling with national security, and its symbolism of U.S. technological strength, the U.S. aerospace industry holds a unique position in the Nation's industrial structure. Federal science and technology policy and Federal scientific and technical information (STI) policy loom important as strategic contributions to the U.S. aerospace industry's leading competitive position. However, three fundamental policy problems exist. First, the United States lacks a coherent STI policy and a unified approach to the development of such a policy. Second, policymakers fail to understand the relationship of STI to science and technology policy. Third, STI is treated as a part of general information policy, without any recognition of its uniqueness. This paper provides an overview of the Federal information policy structure as it relates to STI and frames the policy issues that require resolution. Author (revised)

The project serves to understand how the NASA/DOD research results are transferred into the aerospace R&D process, while providing a basis for understanding the aerospace information dissemination process itself and the implications of the process at the individual, organizational, national, and international levels. The project objectives include understanding the aerospace knowledge diffusion process at its various levels, with particular emphasis on the dissemination of government funded aerospace scientific and technical information (STI); understanding the international aerospace knowledge diffusion process at the individual and organizational levels,

emphasizing the policies and systems used to disseminate the results of government funded aerospace STI; understanding how government technical reports and aerospace librarians assist in the transfer and utilization of knowledge derived from federally funded aerospace R&D; gaining recognition and acceptance in the aerospace community that STI is a valuable resource for innovation, problem solving, and productivity; and assisting in optimizing the effectiveness and efficiency of the STI aerospace transfer system and exchange mechanism. These objectives will be achieved by providing descriptive and analytical data regarding the flow of STI. CASI

This paper is based on the premise that scientific and technical information (STI), its use by aerospace engineers and scientists, and the aerospace research and development (R&D) process are related. We intend to support this premise with data gathered from numerous studies concerned with STI, the relationship of STI to the performance and management of R&D activities, and the information use and seeking behavior of engineers in general and aerospace engineers and scientists in particular. We intend to develop and present a synthesized appreciation of how aerospace R&D managers can improve the efficacy of the R&D process by understanding the role and value of STI in this process. A FLEXIBLE IBM-PC BASED DATA ACQUISITION SYSTEM FOR NUCLEAR PHYSICS EXPERIMENTS
B. Hovander, A. Johansson, G. Appelquist, A. Ekholm, K. Fransson, and C. Bohm Sep. 1992 8 p
(USIP-92-02; ETN-93-94845) Avail: CASI HC A02/MF A01

A SCSI-bus data acquisition module, which serves up to 15 12-bit NIM-standard spectroscopy ADC's, is described. When operating in cascade mode, 8 modules may serve up to 112 ADC's. The module was primarily developed for use in nuclear physics experiments. A typical system configuration consists of a data acquisition module, a SCSI-bus mass storage device (Video-8 or DAT), and a personal computer system controller. The latter also serves as a monitor allowing on-line evaluation of the quality of the incoming experimental data. The module has a micro-controller, a SCSI-bus controller, and a field programmable gate array as main components. The gate array implements most of the ADC arbitration and read-out logic. The module was designed to allow a high degree of flexibility. This was accomplished by allowing the control programs and gate array configurations to be down-loaded from the system controller. The design thus permits rather extensive functional modifications without changing the hardware. It also allows thorough testing by down-loading test programs and test configurations. ESA

MDFF HELP LIBRARY, VERSION 2: ON-LINE DOCUMENTATION FOR THE MAP DATA FORMATTING FACILITY Final Report
S. A. Myrick, P. W. Wischow, M. C. Lohrenz, M. E. Trenchard, and M. L. Gendron 7 Mar. 1994 211 p
(AD-A277763; NRL/MR/7441-93-7071) Avail: CASI HC A10/MF A03

The purpose of this report is to describe on-line documentation for the Naval Research Laboratory's Map Data Formatting Facility (MDFF). The MDFF utilizes Digital Equipment Corporation (DEC) computers to process several types of data including Compressed Aeronautical Chart, Compressed Nautical Chart, and Digital Landmass System. Using DEC software utilities, online documentation has been developed that provides information pertaining to the processing and compression of these data types and to other topics that are specific to the MDFF. A RADIAL BASIS FUNCTION APPROACH TO FINANCIAL TIME SERIES ANALYSIS Ph.D. Thesis
James M. Hutchinson Dec. 1993 151 p
(Contracts N00014-92-J-1879; N00014-93-1-0385; N00014-91-J-4038)
(AD-A276408; AI-TR-1457) Avail: CASI HC A08/MF A02

Nonlinear multivariate statistical techniques on fast computers offer the potential to capture more of the dynamics of the high dimensional, noisy systems underlying financial markets than traditional models, while making fewer restrictive assumptions. This thesis presents a collection of practical techniques to address important estimation and confidence issues for Radial Basis Function networks arising from such a data driven approach, including efficient methods for parameter estimation and pruning, a pointwise prediction error estimator, and a methodology for controlling the 'data mining' problem. Novel applications in the finance area are described, including customized, adaptive option pricing and stock price prediction. DTIC

(ISSN 0922-5641)
(Rept-93-86; ETN-94-96131) Copyright Avail: CASI HC A03/MF A01

The budget of a multiproduct dominant firm has to be allocated to the several production centers within the firm. The objective is to maximize the firm's profit given price demand functions and production functions of the individual products. A solution method based on Lagrange decomposition is presented. This results in a product ranking having a clear economic interpretation and an analysis of the allocation policy. ESA

COMMON PROPERTY RESOURCES AND LOW-LEVEL FLYING IN LABRADOR: FLIGHT, FIGHT OR FANCY? M.A. Thesis
Sherri Labour Sep. 1993 112 p
(ISBN-0-315-87318-3; CTN-94-61240) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Modern, low-level training flights have been conducted out of the air base at Goose Bay, Labrador since the early 1980s. The flying season is restricted to seven months a year (April to November) over two flight training areas totalling 99,000 square km. The flights usually last 60-90 minutes, often consist of two planes flying in formation, and may come as close as 30 m to the ground. Aboriginal groups have protested against these flights because of their possible effect on the environment and on native life styles based on a hunting and fishing economy. A study is presented which illustrates how the fundamentally different attitudes and values that Euro-Canadians and aboriginals attach to land are at the core of the conflict over low-level flying in Labrador. It is shown how common property resource management strategies can mediate the contrasting attitudes and values of the aboriginals and the Canadian Defence Department with respect to land and nature. Emphasis is placed on understanding the human side of the problem and the personal and political concerns of the people involved in the conflict. Author (CISTI)

EXTREME ULTRAVIOLET OPACITY SOURCES IN THE DA WHITE DWARF G191-B2B Ph.D. Thesis
Erik Wilkinson 1993 139 p
Avail: Univ. Microfilms Order No. DA9320489

The goal of this work is to evaluate the cause(s) of the short wavelength deficit apparent in existing extreme ultraviolet observations of the DA white dwarf G191-B2B. G191-B2B is a hot (T(sub eff) approximately equal to 55,000 K) white dwarf located 45 parsecs from earth in the constellation of Aurigae. Observations of G191-B2B with the Al/P and LX3000 photometers onboard the European X ray Observatory (EXOSAT) show the count rate of the Al/P photometer (170 A less than or equal to lambda less than or equal to 300 A) is almost ten times higher than the LX3000 (44 A less than or equal to lambda less than or equal to 300 A)

count rate. Pure hydrogen white dwarf model atmospheres predict the photometer count rates should be similar. This discrepancy suggests a short wavelength opacity source(s) is present in the photosphere of G191-B2B. A unique sounding rocket borne instrument with sufficient spectral resolution and sensitivity to investigate the implied opacity source(s) was designed, built, calibrated, and flown. The instrument made observations of G191-B2B between 200 A and 330 A with Delta-lamda = 2 A. The design, calibration, and flight performance of the instrument are discussed. Several absorption features in the spectrum are identified, their statistical significance is evaluated, and potential sources of the features are investigated. Dissert. Abstr.

GAMMA LARGE AREA SILICON TELESCOPE (GLAST)
G. L. Godfrey Nov. 1993 16 p Presented at the 2nd Towards a Major Atmospheric Cerenkov Detector Workshop, Calgary, Ontario, 17-18 Jul. 1993
(Contract DE-AC03-76SF-00515)
(DE94-006439; SU-SLAC-PUB-6390; CONF-9307166-1) Avail: CASI HC A03/MF A01

The recent discoveries and excitement generated by EGRET have prompted an investigation into modern technologies ultimately leading to the next generation space-based gamma ray telescope. The goal is to design a detector that will increase the data acquisition rate by almost two orders of magnitude beyond EGRET, while at the same time improving on the angular resolution, the energy measurement of reconstructed gamma rays, and the triggering capability of the instrument. The GLAST proposal is based on the assertion that silicon particle detectors are the technology of choice for space application: no consumables, no gas volume, robust (versus fragile), long lived, and self triggering. The GLAST detector is roughly modeled after EGRET in that a tracking module precedes a calorimeter. The GLAST Tracker has planes of thin radiatior interspersed with planes of crossed-strip (x,y) 300 micron-pitch silicon detectors to measure the coordinates of converted electron-positron pairs. The gap between the layers (approximately 5 cm) provides a lever arm in track fitting resulting in an angular resolution of 0.1 deg at high energy (the low energy angular resolution at 100 MeV would be about 2 deg, limited by multiple scattering). A possible GLAST calorimeter is made of a mosaic of CsI crystals of order 10 r.l. in depth, with silicon photodiodes readout. The increased depth of the GLAST calorimeter over EGRET's extends the energy range to about 300 GeV. DOE

CO OBSERVATIONS IN EXTERNAL GALAXIES AND GAS MASS DETERMINATION Ph.D. Thesis
Shuding Xie 1993 250 p
Avail: Univ. Microfilms Order No. DA9316728

We investigate three aspects in the determinations of molecular gas masses from (sup 12)CO, (sup 13)CO, and dust emission. Using the (sup 12)CO, (sup 13)CO J = 2 - 1 and 1 - O as well as CS J = 2 - 1 data obtained with the 14 m FCRAO telescope, in conjunction with radiative transfer calculations, we estimate the average temperature and density of the molecular gas at the centers of two actively star-forming galaxies, NGC 2146 and IC 342. The physical conditions of the gas in the nuclei of these two galaxies differ from those in the disk of our own Galaxy. However, the CO luminosity to molecular gas mass ratios are found to be similar in these two galaxies. The ratios are within a factor of 2 of the value in the Milky Way if the Galactic CO abundance is assumed. We present a simple model to estimate the dust temperature distributions in galaxies based on the FIR/sub mm observations. The uncertainties in the dust mass owing to inexact modeling of the temperature distribution, uncertainty in the emissivity law, imprecision in the observed data, and the presence of a correlation between grain size and temperature are examined. The dust masses are estimated from the derived dust temperature distributions in 12 galaxies making use of the available data at 60, 100, 345, and 761 microns. The comparison between the dust masses obtained from our model calculations and the gas masses deduced from (sup 12)CO J = 1 - O observation yields an average H2-to-dust mass ratio of 181+/-(sup 119, sub 91). In the determination of H2 column density from (sup 13)CO emission the clumpiness of material in molecular clouds has not been considered in the evaluation of the uncertainties. We take this effect into account to examine the uncertainties owing to the use of the LTE approximation. The clumpy cloud model proposed by Kwan and Sanders (1986) is used over a wide range of parameters. Our calculations indicate that the largest uncertainty arises from the assumption that all levels possess a common excitation temperature in estimating the partition function. The partition function can be either over estimated, owing to subthermal excitations in high J levels, or underestimated, probably owing to an underestimate of the mean excitation temperature when the volumn filling factor is so small that the surface coverage factor of antenna beam is less than one. The uncertainties in N(H2) can be reduced by using an alternative formula to estimate the partition function. Dissert. Abstr.

N94-31898 Cornell Univ., Ithaca, NY.
NEAR INFRARED SURVEYS OF HIGH MASS STAR FORMING REGIONS Ph.D. Thesis
Samuel Thomas Megeath 1993 135 p
Avail: Univ. Microfilms Order No. DA9319366

We present near infrared surveys of the DR22, S184, and W3 high mass star forming regions. Each survey region shows evidence of recent massive star formation, either a maser or compact H II region. We have detected dense clusters in each region. The peak densities for the listed magnitude range of the DR22, S184, and W3 clusters are 83 (m(sub k) is less than 17), 56 (m(sub k) is less than 17), and 216 (m(sub K) is less than 16) stars per square arcminute. Deep J (1.25 micron), H (1.65 micron), and K (2.2 micron) images were obtained at the peak density positions for all three clusters. Color-magnitude diagrams show that 68 percent, 98 percent, and 73 percent of the stars in the DR22, S184, and W3 clusters have masses less than 3.6 solar mass. More than 87 percent of the stars in each cluster are consistent with the K versus H-K values of reddened T-Tauri stars. Color-color diagrams reveal that 23 to 72 percent of the sources in S184 show K-band excesses. These excesses are thought to arise in circumstellar disks and are of magnitudes typical for classical T-Tauri stars. In contrast, less than 27 percent of the stars in DR22 show excesses; the majority of the stars have colors consistent with reddened naked T-Tauri stars. H-K colors show that the S184 and W3 clusters have several magnitudes of internal extinction, while the DR22 cluster shows little internal extinction (less than 1 mag). We examine the K-band luminosity function, the number of stars detected per K-band magnitude interval, for each cluster. We find a peak at 15th magnitude for the DR22 cluster. A comparison of the peak with existing models results in an age for the DR22 cluster between 3 x 10(exp 5) years and 1 x 10(exp 6) years. We do not find similar peaks in the S184 and W3 cluster; however, peaks may be hidden by the high internal extinction observed in both clusters. Finally, we propose that the DR22 cluster is a young cluster which has been unveiled by an advancing H II region front. We suggest that the paucity of excesses in the DR22 cluster is the result of disk disruption by the advancing H II region. Dissert. Abstr.

CONSTRUCTION OF VISUAL REPRESENTATIONS AND TIME-SPACE ORGANIZATION OF RESOURCES IN ASTRONOMY Ph.D. Thesis [CONSTRUCTION DE REPRESENTATIONS VISUELLES ET ORGANISATION SPATIO-TEMPORELLE DES RESSOURCES EN ASTRONOMIE]
Luc Gauthier Sep. 1991 867 p In ENGLISH and FRENCH
(ISBN-0-315-86694-2; CTN-94-61222) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The components of the perceptual behavior of a group of astronomers was studied along with some examples of the organization of resources in space and time in astronomy. It is apparent that the work of constructing visual representations at the beginning of astronomical practice happens through the utilization of categories which are not explicitly defined but which nonetheless are no less effective in their incorporation into a perceptual behavior developed by astronomers during their training and their confrontation with their objective. The origin and nature of these categories is reviewed. The processes covered by the concept of laboratory work, as recently used in the sociology of the sciences are brought up to date. To do this, characteristics of astronomical practice with respect to the structure of utilization of resources in time and space were identified and contrasted through definition of the mechanisms allowing this structuring. These mechanisms should be considered to supplant the laboratory notion. CISTI

A CHEMICAL ANALYSIS OF SOLAR NEIGHBORHOOD DWARFS Ph.D. Thesis
William John Spiesman 1993 154 p
Avail: Univ. Microfilms Order No. DA9326400

In this study we perform a chemical analysis of the most abundant stars of our galaxy, the low mass dwarfs. Little of the chemistry and physics that operate in low mass stars has been measured directly, and most of what we do know about them is based on theory or inferred from higher mass stars. Here we take a first close look at these unwieldy stars using high dispersion spectroscopy, modern stellar atmospheres, and synthetic spectrum techniques. Low mass dwarfs are particularly difficult to study. They are intrinsically faint, so even with modern detectors and large telescopes, we can study only those dwarfs that are very near the sun. Their cool atmospheres are incredibly complex with many molecules contributing to the opacity, and with deep, highly efficient convection. Their spectra are line rich, and since the surface gravities are so high, molecular and atomic lines are almost hopelessly broadened and blended. Despite the difficulties with analyzing these stars, the fact that the evolutionary status of all low mass dwarfs places them unambiguously on the main sequence (or the pre-main sequence) makes knowledge of their chemical content indispensable. Since their convective masses are large, results based on analyses of low mass stars are less susceptible to contamination by impurities which might be added to stellar atmospheres through accretion after star formation. We demonstrate that the temperature scale for the cool dwarfs must be shifted upwards towards warmer temperatures. We present abundance results for a sample of metal-poor and metal-rich K dwarfs showing that the trends of abundance ratios with metallicity seen in giants and in the warmer dwarfs also apply to the lower main sequence. We determine (O/Fe) for the first time from the TiO molecule, with results which are similar to those from atomic lines. Our abundance results for oxygen show that (O/Fe) does not rise above +0.5 for metal poor stars, even at low metallicities. We find that the correlation of sodium abundance with nitrogen that is seen in globular cluster giants also appears in Halo dwarfs. The abundance results for these unevolved stars are interpreted as consequences of the prestellar material from which these stars formed.
Dissert. Abstr.

N94-31968 Cornell Univ., Ithaca, NY.
MEASURING THE HUBBLE CONSTANT AND OUR VIRGO-INFALL VELOCITY INDEPENDENTLY Ph.D. Thesis
Nanyao Lu 1993 180 p
Avail: Univ. Microfilms Order No. DA9318864

We consider two volumes in the local space: AV and BV, in an approximately antipodal geometry relative to the Virgo Cluster (AV: 22(sup h) less than alpha less than 2(sup h), 0(sup o) less than delta less than 20(sup o) and 0 less than upsilon(sub h) less than 3,000 km s(exp -1); BV: 10(sup h)30(sup m) less than alpha less than 13(sup h)30(sup m), 0(sup o) less than delta less than 20(sup o) and 2,500 less than upsilon(sub h) less than 4,500 km s(exp -1). Comparing the galaxies in these two volumes via an I-band Tully-Fisher (TF) relation allows us to independently derive (1) A Hubble ratio, H(sub AB), between the two volumes; and (2) a model independent estimate of Delta(upsilon)(sub double bars), our peculiar velocity in the direction of the Virgo Cluster with respect to the uniformly expanding reference frame of the sample galaxies. High-quality HI 21cm data and I-band CCD photometry were obtained and are presented for the galaxies in the following two samples in the target volumes: (1) a main galaxy sample, called the CfA sample and consisting of 123 disk galaxies, is complete to B(sub T) = 14.5 and was used to derive H(sub AB) and Delta(upsilon)(sub double bar); and (2) a supplementary sample, called the faint sample and consisting of 73 galaxies with B(sub T) less than 14.5, was used to control the Malmquist bias. To reduce both the TF scatter and Malmquist bias, only CfA galaxies with a corrected HI width W(sub R) greater than W(sub R, sup min) were used in our TF analysis, where W(sub R, sup min) approximately equals 181 km s(exp -1) for the AV and approximately 234 for the BV sample. We then corrected the residual Malmquist bias and properly estimated the TF scatter by introducing two 'counterfeit' galaxies. Using the faint sample, we show that the TF dispersion has a dominant and well defined Gaussian peak with an intrinsic rms dispersion sigma(sub TF, sup 0) equivalent to 0.3 mag for W(sub R) greater than or approx. equal to 180 km s(exp -1). We finally found Delta(upsilon)(sub double bar) approximately equal to 410+/- 85 km/s and H(sub AB) approximately equal to 88 +/- 4 km/s Mpc(exp -1). We tested various local velocity models, using the above value of Delta(upsilon)(sub double bar) as a constraint, to explore the variation of H(sub AB)/H(sub O) (where H(sub O) is the postulated Hubble constant for each model). We found: (1) Pure Virgo-infall models in general give a consistent Delta(upsilon)(sub double bar). (2) A bi-infall model involving either a nearby Great Attractor (GA) or a distant GA gives a Delta(upsilon)(sub double bar) which is systematically lower. (3) H(sub AB)/H(sub O) has a mean of 0.95 and a variance less than approximately 6% among all the models. The small variation, attributed to the fact that only a tidal velocity field has effects on H(sub AB), makes the local measurements of H(sub O) meaningful. (4) Our best estimate for the Hubble constant is H(sub O) approximately equals (92 +/- 4)(1 + epsilon)km s(exp -1) Mpc(exp -1), where (1 + epsilon) accounts for the (unknown) possible systematic error in the distances of the local calibrators, which are few in number.

NEAR AND FAR INFRARED OBSERVATIONS OF PROTOSTARS AND DARK CLOUDS Ph.D. Thesis
Mark Gerard Suters 1992
Avail: Issuing Activity (MIT Libraries, Rm. 14-0551, Cambridge, MA 02139-4307)

Far infrared point source and extended emission data from the Infrared Astronomical Satellite (IRAS) survey are used to investigate the properties of star formation in the regions of high galactic latitude dark cloud complexes. The properties of individual sources are examined using near infrared spectroscopy and broad band spectral energy distributions. The IRAS signature of star formation is derived by comparing the far infrared colors of a sample of protostars with those of other common far infrared objects. The quality of the IRAS data is ignored for the purposes of this investigation. The criteria developed for identifying protostars from the IRAS Point Source Catalog discriminates against most non-protostellar objects, with the exception of galaxies and HII regions. Objects identified as protostellar according to other criteria are also likely to be identified by the criteria developed. Extended emission data in the far infrared is used to estimate the column density and temperature of several dark cloud complexes, and the optical extinction in the same regions is estimated with the Guide Star Catalog. Temperature and column density share an inverse relationship cloud cores are characterized by column densities above 10(exp 24) hydrogen atoms m(exp -2) and temperatures around 20 K, while the inter cloud medium has column densities below 10(exp 23) atoms m(exp -2) and temperatures above 50 K. The column density, as measured by IRAS, and the optical extinction appear to be related up to values of around 10(exp 25) atoms m(exp -2) and 5 magnitudes respectively but the IRAS detectors appear insensitive to material at higher densities than these. Near infrared spectra of a variety of objects chosen for their youth, including IRAS sources which satisfy the protostar criteria, are investigated. These spectra are categorized into three distinct groups of increasing youth: (1) T Tauri-like spectra, with flat H and K band continua, lacking both Br-gamma emission and CO absorption; (2) FU Orilike spectra, with Br-gamma emission, CO absorption, and 1.9 micron water absorption, and (3) embedded protostar spectra, with red continuum, Br-gamma emission, but lacking CO absorption. The spectral energy distributions (SED's) of the sources are also investigated, wing data at wavelengths from 0.3 micron to 100 microns. All of the objects studied in the near infrared have SED's characteristic of either T Tauri stars or of embedded protostars. There seems little correlation between the evolutionary status assigned to an object on the basis of its SED and that assigned from near infrared spectral features perhaps because the shape of the SED is independent of the evolution of the central object, and depends on geometric considerations such as the orientation of the circumstellar disk in relation to the line of sight from the Earth.

Adaptive optic systems promise to give diffraction limited performance to ground based telescopes operating at visible and near infrared wavelengths. However, because of the short spatial scale of atmospheric turbulence, the corrected field of view is limited to only a few arc seconds in the visible and to perhaps 10 arc seconds at L band (3.5 mu). A bright point source must be in this field of view as a wavefront reference, but the number density of natural stars is too small for full sky coverage at imaging wavelengths less than 3 mu. A sufficiently bright point source can be artificially generated by a laser, however, and investigations into the use of laser beacons has been proceeding for some time now. Our experiments at Livermore have concentrated on the formation of guide stars in the sodium mesospheric layer at 90 km altitude. We have also designed and built adaptive optics systems that use both artificial and natural guide stars. Experimental results to date have shown great promise for the practicality of this technique in astronomy. DOE

A CRITICAL EXAMINATION OF STELLAR ATMOSPHERE THEORY FOR METAL-POOR K-GIANT STARS Ph.D. Thesis
Cristina Morea DalleOre 1993 188 p
Avail: Univ. Microfilms Order No. DA9317939

State of the art model atmospheres are closely examined for a sample of nine bright K-giant stars. For one star, HD 122563, considered a standard for its wealth of data in the literature, the best available spectroscopic data and input parameters were used. We find a serious inconsistency in the atmosphere theory: in three, maybe four, of the stars in the sample, the temperature obtained from excitation and ionization equilibria differs by up to 300 K from the temperature obtained from accurate photometric sources. This error shows up as a slope in the derived Fe abundances versus excitation potential when the photometric temperatures are used. No clear correlation is found between the temperature discrepancy and star characteristics. Several possible causes of error are examined for HD 122563, the standard star. The analysis is carried out with different codes making use of various sets of atomic parameters; all yield comparable slopes. Assumptions made in the atmosphere code are tested; none of them affect the slope in a significant way. Non-LTE corrections are estimated, and a nonhomogeneous atmosphere model is computed yielding no effect on the slope. An analysis similar to the one performed in HD 122563 yields no significant slope in the solar Fe I abundances, ruling out the possibility of systematic errors in the values. A more comprehensive survey of solar Fe abundances is also performed, yielding greater understanding of previously discrepant solar (Fe/H) values in the literature. While these avenues do not lead to an explanation of the slope problem, they show that the slope is not an artifact of the data or of the analysis. Assuming that all elements behave like iron, we estimate possible errors of approximately plus or minus 0.2 dex for HD 122563 in the abundances of elements other than Fe, depending on the excitation potential of the lines adopted in the analysis. Ratios of element abundances calculated on lines with comparable excitation potential should not be affected. The magnitude of these errors does not affect the basic trends in abundance ratios versus metallicity; they are comparable to the observed and as yet unexplained scatter that plagues the same trends. DIGITAL IMAGE PROFILERS FOR DETECTING FAINT SOURCES WHICH HAVE BRIGHT COMPANIONS Final Report
Elena Morris, Graham Flint, and Robert Slavey 27 May 1992 214 p
(Contract NAS7-1103; SBIR-08.18-0700)
(NASA-CR-191348; NAS 1.26:191348) Avail: CASI HC A10/MF A03

For this program, an image profiling system was developed which offers the potential for detecting extremely faint optical sources that are located in close proximity to bright companions. The approach employed is novel in three respects. First, it does not require an optical system wherein extraordinary measures must be taken to minimize diffraction and scatter. Second, it does not require detectors possessing either extreme uniformity in sensitivity or extreme temporal stability. Finally, the system can readily be calibrated, or nulled, in space by testing against an unresolved singular stellar source. Author (revised)

(NASA-CR-195818; NAS 1.26:195818) Avail: CASI HC A03/MF A01

The Burst and Transient Source Experiment (BATSE) is one of four instruments on the Compton Observatory which was launched by the space shuttle Atlantis on 5 Apr. 1991. As of the end of Nov. 1993, BATSE detected more than 830 cosmic gamma ray bursts and more than 690 solar flares. Pulsed gamma rays have been detected from at least 16 sources and emission from at least 28 sources (including most of the pulsed sources) has been detected by the earth occultation technique. The daily BATSE operations tasks represent a substantial level of effort and involve a large team which includes MSFC personnel as well as contractors such as UAH. The effort is naturally divided into several areas: data operations, burst operations, occultation operations, and pulsar operations. UAH personnel have been involved to some extent in all of these as well as contributing to various areas of scientific data analysis. Derived from text

A metagalactic model for the universe, in which the expansion is caused by a series of hierarchical explosions, is developed. The evolution of the distribution of matter is described by a Botzmann equation, for which solutions are found in the nonrelativistic case. By studying the evolution of the peculiar velocities in the metagalaxy, the model can be applied to metagalactic cosmology. An upper limit for the radius of the metagalaxy is obtained. This turns out to be too small to be compatible with the highest redshifts observed. Two modifications of the model are studied, but the difficulties still remain. ESA

The physics of accretion flow very close to a black hole is dominated by several general relativistic effects. It cannot be described by the standard Shakura Sunyaev model or by its relativistic version developed by Novikov and Thorne. The most important of these effects is a dynamical mass loss from the inner edge of the disk (Roche lobe overflow). The relativistic Roche lobe overflow induces a strong advective cooling, which is sufficient to stabilize local, axially symmetric thermal and viscous modes. It also stabilizes the non-axially-symmetric global modes discovered by Papaloizou and Pringle. The Roche lobe overflow, however, destabilizes sufficiently self-gravitating accretion disks with respect to a catastrophic runaway of mass due to minute changes of the gravitational field induced by the changes in the mass and angular momentum of the central black hole. One of the two acoustic modes may become trapped near the inner edge of the disk. All these effects, absent in the standard model, have dramatic implications for time-dependent behavior of the accretion disks around black holes. Author

Avail: CASI HC A01/MF A01

Warped H1 gas layers in the outer regions of spiral galaxies usually display a noticeably twisted structure. This structure is thought to arise primarily as a result of differential precession in the H1 disk as it settles toward a 'preferred orientation' in an underlying dark halo potential well that is not spherically symmetric. In an attempt to better understand the structure and evolution of these twisted, warped disk structures, we have utilized the 'twist-equation' formalism. Specifically, we have generalized the twist equation to allow the treatment of non-Keplerian disks and from it have derived the steady-state structure of twisted disks that develop from free precession in a nonspherical, logarithmic halo potential. This generalized equation can also be used to examine the time-evolutionary behavior of warped galaxy disks. Author (revised)

(Grants NAGw-2447; NSF AST-90-08166)
Avail: CASI HC A01/MF A01

In the Concurrent Computing Laboratory in the Department of Physics and Astronomy at Louisiana State University we have constructed a heterogeneous computing environment that permits us to routinely simulate complicated three-dimensional fluid flows and to readily visualize the results of each simulation via three-dimensional animation sequences. An 8192-node MasPar MP-1 computer with 0.5 GBytes of RAM provides 250 MFlops of execution speed for our fluid flow simulations. Utilizing the parallel virtual machine (PVM) language, at periodic intervals data is automatically transferred from the MP-1 to a cluster of workstations where individual three-dimensional images are rendered for inclusion in a single animation sequence. Work is underway to replace executions on the MP-1 with simulations performed on the 512-node CM-5 at NCSA and to simultaneously gain access to more potent volume rendering workstations. Author

AN EFFICIENT THREE-DIMENSIONAL POISSON SOLVER FOR SIMD HIGH-PERFORMANCE-COMPUTING ARCHITECTURES Abstract Only **c61**
H. Cohl *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 1 (For primary document see N94-31116 09-90)
(Grants NAGw-2447; NSF AST-90-08166)
Avail: CASI HC A01/MF A01

We present an algorithm that solves the three-dimensional Poisson equation on a cylindrical grid. The technique uses a finite-difference scheme with operator splitting. This splitting maps the banded structure of the operator matrix into a two-dimensional set of tridiagonal matrices, which are then solved in parallel. Our algorithm couples FFT techniques with the well-known ADI (Alternating Direction Implicit) method for solving Elliptic PDE's, and the implementation is extremely well suited for a massively parallel environment like the SIMD architecture of the MasPar MP-1. Due to the highly recursive nature of our problem, we believe that our method is highly efficient, as it avoids excessive interprocessor communication. Author (revised)

THE DYNAMICAL SETTLING OF WARPED DISKS AND ANGULAR MOMENTUM TRANSPORT IN GALAXIES Abstract Only
P. Fisher *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 1 (For primary document see N94-31116 09-90)
(Grants NAGw-2447; NSF AST-90-08166)
Avail: CASI HC A01/MF A01

We present results of three-dimensional, hydrodynamic models of gaseous disks settling in a nonspherical potential. As the gas settles, differential precession creates a warped disk similar to the warps seen in spiral galaxies. A logarithmic potential, indicative of a massive halo, seems to induce warps more extreme than those produced by a l/r potential with a quadrupole distortion. Author

OBSERVATIONS OF ACCRETION AND ANGULAR MOMENTUM REGULATION IN YOUNG CIRCUMSTELLAR DISKS AND THE IMPLICATIONS FOR PLANETARY FORMATION Abstract Only
P. Hartigan *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 2 (For primary document see N94-31116 09-90)
Avail: CASI HC A01/MF A01

Accretion disks around young stars produce excess infrared continuum associated with the disk and excess optical and ultraviolet continua associated with the boundary layer or 'hot spot' as material falls from the disk onto the stellar photosphere. When we subtract the excess continuum and photospheric contributions to the total spectrum, we can obtain high-quality emission line profiles of the Balmer lines as well as permitted lines from other elements. These emission lines often exhibit redshifted absorption, indicative of infalling material. Remarkably, objects with large accretion rates tend to rotate slower than their counterparts that lack accretion disks. Hence, there must be some process, probably involving magnetic fields, that allows the star to accrete large amounts of material from the disk without increasing its rotational velocity. Young stars typically do not have optically thick inner disks that do not accrete. Hence, either planets form within accretion disks, or the timescale for planetary formation is considerably shorter than approx. 3 x 10(exp 6) yr, the duration of the classical T Tauri star phase of young stellar evolution. DISK INSTABILITY AND THE SPECTRAL EVOLUTION OF THE 1992 OUTBURST OF THE INTERMEDIATE POLAR GK PERSEI Abstract Only
S.-W. Kim, J. C. Wheeler, F. C. Bruhweiler, M. Fitzurka, K. Beuermann, K. Reinsch, and S. Mineshige *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 2 (For primary document see N94-31116 09-90)
Avail: CASI HC A01/MF A01

The disk instability model can explain the previous history of

dwarf-nova-like outbursts in the intermediate polar GK Per, which occur about once every three years. Disk models that reproduce the recurrence time and outburst light curves suggest that GK Per has a large effective inner disk radius (approx. 30-40 white dwarf radii) truncated by a strong magnetic field (10(exp 7) G). In this context, the effective radius is that of the portion of the disk that participates in the disk thermal instability. The radius derived is larger than the corotation radius, which must be an upper limit on the true dynamical inner radius of the disk. Disk instability models with this large effective inner radius predict that the ultraviolet continuum should be rather flat. Here we compare the predictions of the disk instability model to IUE observations of the 1981 outburst and to IUE and ROSAT observations of the recent 1992 outburst of GK Per. The model disk continuum spectral evolution is consistent with the observed UV and optical spectra, especially at maximum and in the early decay phase of the outburst. The consistency of the model with the observed UV spectra suggests that the effective inner radius of the disk is almost constant, independent of mass accretion rate, and that whatever structure lies between the effective inner radius and the corotation radius neither participates in the disk instability nor radiates substantially in the UV. The related physics of the inner disk region will be briefly discussed. Author (revised)

DISK IRRADIATION AND LIGHT CURVES OF X RAY NOVAE Abstract Only

S.-W. Kim, J. C. Wheeler, and S. Mineshige *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 2 (For primary document see N94-31116 09-90)

Avail: CASI HC A01/MF A01

We study the disk instability and the effect of irradiation on outbursts in the black hole X-ray nova system. In both the optical and soft X-rays, the light curves of several X-ray novae, A0620-00, GH 2000+25, Nova Muscae 1991 (GS 1124-68), and GRO J0422+32, show a main peak, a phase of exponential decline, a secondary maximum or reflare, and a final bump in the late decay followed by a rapid decline. Basic disk thermal limit cycle instabilities can account for the rapid rise and overall decline, but not the reflare and final bump. The rise time of the reflare, about 10 days, is too short to represent a viscous time, so this event is unlikely to be due to increased mass flow from the companion star. We explore the possibility that irradiation by X-rays produced in the inner disk can produce these secondary effects by enhancing the mass flow rate within the disk. Two plausible mechanisms of irradiation of the disk are considered: direct irradiation from the inner hot disk and reflected radiation from a corona or other structure above the disk. Both of these processes will be time dependent in the context of the disk instability model and result in more complex time-dependent behavior of the disk structure. We test both disk instability and mass transfer burst models for the secondary flares in the presence of irradiation. Author (revised)

TIME-DEPENDENT BEHAVIOR OF ACTIVE GALACTIC NUCLEI WITH PAIR PRODUCTION Abstract Only

H. Li and C. D. Dermer *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 2 (For primary document see N94-31116 09-90)

Avail: CASI HC A01/MF A01

We study the properties of coupled partial differential equations describing the time-dependent behavior of the photon and electron occupation numbers for conditions likely to be found near active galactic nuclei (AGN). The processes governing electron acceleration are modeled by a stochastic accelerator, and we include acceleration by Alfvenic and whistler turbulence. The acceleration of electrons is limited by Compton and synchrotron losses, and the number density of electrons depends on pair production and annihilation processes. We also treat particle escape from the system. We examine the steady, (possibly) oscillatory, and unstable solutions that arise for various choices of parameters. We examine instabilities related to pair production and trapping and consider the formation of pair jets.

OBSERVATIONAL CONSTRAINTS ON BLACK HOLE ACCRETION DISKS Abstract Only

Edison P. Liang *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 2-3 (For primary document see N94-31116 09-90)

Avail: CASI HC A01/MF A01

We review the empirical constraints on accretion disk models of stellar-mass black holes based on recent multiwavelength observational results. In addition to time-averaged emission spectra, the time evolutions of the intensity and spectrum provide critical information about the structure, stability, and dynamics of the disk. Using the basic thermal Keplerian disk paradigm, we consider in particular generalizations of the standard optically thin disk models needed to accommodate the extremely rich variety of dynamical phenomena exhibited by black hole candidates ranging from flares of electron-positron annihilations and quasiperiodic oscillations in the X-ray intensity to X-ray novae activity. These in turn provide probes of the disk structure and global geometry. The goal is to construct a single unified framework to interpret a large variety of black hole phenomena. This paper will concentrate on the interface between basic theory and observational data modeling. Author (revised)

NONLINEAR CALCULATIONS OF THE TIME EVOLUTION OF BLACK HOLE ACCRETION DISKS Abstract Only

C. Luo *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 3 (For primary document see N94-31116 09-90)

Avail: CASI HC A01/MF A01

Based on previous works on black hole accretion disks, I continue to explore the disk dynamics using the finite difference method to solve the highly nonlinear problem of time-dependent alpha disk equations. Here a radially zoned model is used to develop a computational scheme in order to accommodate functional dependence of the viscosity parameter alpha on the disk scale height and/or surface density. This work is based on the author's previous work on the steady disk structure and the linear analysis of disk dynamics to try to apply to x-ray emissions from black candidates (i.e., multiple-state spectra, instabilities, QPO's, etc.).

We construct evolutional scenarios for LMXB's using a simplified stellar model. We discuss the origin and evolution of short-period, low mass binary pulsars with evaporating companions. We suggest that these systems descend from low-mass X-ray binaries and that angular momentum loss mainly due to evaporative wind drives their evolution. We derive limits on the energy and angular momentum carried away by the wind based on the observed low eccentricity. In our model the companion remains near contact, and its quasiadiabatic expansion causes the binary to expand. Short-term oscillations of the orbital period may occur if the Roche-lobe overflow forms an evaporating disk. Author (revised)

CAN A VARIABLE ALPHA INDUCE LIMIT CYCLE BEHAVIOR AND EXPONENTIAL LUMINOSITY DECAY IN TRANSIENT SOFT X RAY SOURCES? Abstract Only **c93**

C. MeirellesFilho and Edison P. Liang *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 3-4 (For primary document see N94-31116 09-90)

Avail: CASI HC A01/MF A01

There has been, recently, a revival of the stability problem of accretion disks. Much of this renewed interest is due to recent observational data

on transient soft X-ray novae, which are low-mass X-ray binaries. It is widely believed that nonsteady mass transfer from the secondary onto the compact primary, through an accretion disk, is the reason for the observed spectacular events in the form of often repetitive outbursts, with recurrence times ranging from 1 to 60 yr and duration time on the scale of months. Though not having reached yet a consensus about the nature of the mechanism that regulates the mass transfer, the disk thermal instability model seems to be favored by the fact that the rise in the hard X-ray luminosity is prior to the rise in the soft X-ray luminosity, while the mass transfer instability model seems to be hindered by the fact that the luminosity during quiescence is unable to trigger the thermal instability. However, it should be stressed that, remarkably, the X-ray light curves of these X-ray novae all show overall exponential decays, a feature quite difficult to reproduce in the framework of the viscous disk model, which yields powerlike luminosity decay. Taking into account this observational constraint, we have studied the temporal evolution of perturbations in the accretion rate, under the assumption that alpha is radial and parameter dependent. The chosen dependence is such that the model can reproduce limit cycle behavior (the system is locally unstable but globally stable). However, the kind of dependence we are looking for in alpha does not allow us to use the usual Shakura and Sunyaev procedure in the sense that we no longer can obtain a linearized continuity equation without explicit dependence on the accretion rate. This is so because now we cannot eliminate the accretion rate by using the angular momentum conservation equation.

CONVECTIVE SOLAR NEBULA Abstract Only **c92**

C. MeirellesFilho and M. Reyes-Ruiz *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 4 (For primary document see N94-31116 09-90)

Avail: CASI HC A01/MF A01

Analyzing turbulent flows with rotation, Dubrulle and Valdettaro have concluded that some new effects come into play and may modify the standard picture we have concerning turbulence. In that respect the value of the Rossby number is of crucial importance since it will determine the transition between regimes where rotation is or is not important. With rotation there will be a tendency to constrain the motion to the plane perpendicular to the rotation axis and as a consequence the horizontal scale will increase as compared to the longitudinal one, which means that the turnover time in this direction will increase. The net effect is that the energy cascade down process is hindered by rotation. As a matter of fact, when rotation is present one observes two cascades: an enstrophy (vorticity) cascade from large scales to small scales; and an inverse energy cascade from small scales to large scales. Since the first process is not efficient on transporting energy to the dissipation range, what we see is energy storage in the large structures at the expense of the small structures. This kind of behavior has been confirmed experimentally. For a very large gamma we obtain, in the inertial range, a spectrum of k(exp -3) instead of the usual Kilmogorov's k(exp -5/3) spectrum. In reality, when rotation is dominant, energy gets stored in inertial waves that propagate it essentially in the longitudinal direction. In that case, we can no longer assign just one viscosity to the fluid and, what is most important, the concept of viscosity loses its meaning since we no longer have local transport of energy. Such results, however, were derived considering a hot disk, in which opacity is mainly given by electron scattering. In the present work we have applied the formulation developed in the previous work for the description of the viscous-stage solar nebula. Author (revised)

ROTATIONAL EFFECTS IN TURBULENCE DRIVEN BY CONVECTION Abstract Only

C. MeirellesFilho, M. Reyes-Ruiz, and C. Luo *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 4-5 (For primary document see N94-31116 09-90)

Avail: CASI HC A01/MF A01

We have treated turbulence with rotation in a thin Keplerian disk. Highlighting implicit assumptions already existent in the alpha model together with a geometrical but physically reasonable deduction of the degrees of freedom of the largest eddies, which is of paramount importance in our formulation, we were able to obtain relations satisfied by parameters of the turbulence, such as turnover time and alpha. The effects of rotation in the turbulence we have taken implictly through an anisotropy factor (x) which is simply related to the Rossby number. Convection is the process assumed to generate turbulence, and we have used Canuto and Goldman's treatment of convective instability, whose characteristic growth time we have assumed equal to the turnover time. We have also used their procedure to obtain the turbulent viscosity. Author (revised)

A CONSTRAINT ON THE PAIR-DENSITY RATIO (Z+) IN AN ELECTRON-POSITRON PAIR WIND Abstract Only

M. D. Moscoso and J. C. Wheeler *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 5 (For primary document see N94-31116 09-90)

Avail: CASI HC A01/MF A01

We derive a constraint on the pair density ratio, z(sub +) = n(sub +)/n(sub p), in an electron-positron pair wind flowing away from the central region of an accretion disk around a compact object under the assumption of a coupling between electrons, positrons, and protons. The minimum rate at which positrons are injected into the annihilation volume is given by the observed annihilation flux per unit volume. This rate is then used to determine a minimum mass loss rate per unit area, M(dot)(sub *) for a given pair density ratio at the base of the streamline. The requirement that M(dot)(sub *) less than M(dot)(sub *)(sub Edd) (the mean Eddington mass loss rate per unit area) then places a lower limit on the pair density ratio, z(sub +,)(sub min). A positron annihilation line was observed in Nova Muscae 1991 by GRANAT/SIGMA. The narrow width and redshift of the line suggest that the pair production and annihilation regions are physically distinct. We hypothesize that an electron-positron pair wind transports the pairs from the production to the annihilation region and calculate z(sub +),(sub min). We then determine constraints on the physical parameters on the pair production region by comparing z(sub +),(sub min) with previous studies of two-temperature and one-temperature accretion disks with electron-positron pairs. CIRCUMSTELLAR MATERIAL AROUND YOUNG STARS IN ORION Abstract Only

C. R. ODell *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 5-6 (For primary document see N94-31116 09-90)

Avail: CASI HC A01/MF A01

The star cluster associated with the Orion nebula is one of the richest known. Lying at the nearside of the Orion Molecular cloud and at a distance of about 500 pc from us, it contains many premain-sequence stars with ages of about 300,000 yr. The nebula itself is a blister type, representing a wall of material ionized by the hottest star in the Trapezium group (member C). Although this is not the closest star formation region, it is probably the easiest place to detect circumstellar, possibly proto-planetary, material around these solar mass stars. This is because the same process of photoionization that creates the nebula also photoionizes these circumstellar clouds, thus rendering them easily visible. Moreover, their dust component is made visible by extinction of light from the background nebula. Young stars with circumstellar material were found in Orion on the second set of HST images and were called proplyds, indicating their special nature as circumstellar clouds caused to be luminous by being in or near a gaseous nebula. The brightest objects in the field had previously been seen in the optical and radio, and although their true nature had been hypothesized it was the HST images that made it clear what they are. The forms vary from cometlike when near the Trapezium to elliptical when further away, with the largest being 1000 AU and the bright portions of the smallest, which are found closest to the Trapezium, being about 100 AU in diameter. We now have a second set of HST observations made immediately after the refurbishment mission that provides even greater detail and reveals even more of these objects. About half of all the low-luminosity stars are propiyds. The poster paper describes quantitative tests about their fundamental structure and addresses the question of whether the circumstellar material is a disk or shell. One object (HST 16) is seen only in silhouette against the nebula and is easily resolved into an

elliptical form of optical depth monotonically increasing toward the central star. Author (revised)

A STUDY OF ANGULAR MOMENTUM LOSS IN BINARIES USING THE FREE LAGRANGE METHOD Abstract Only

A. M. Rajasekhar *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 6 (For primary document see N94-31116 09-90)

(Grants NAGw-2447; NSF AST-90-20855)

Avail: CASI HC A01/MF A01

The evolution of a binary star system depends greatly on the angular momentum losses in the system brought about by gravitational radiation and mass outflow (e.g., evaporating winds and magnetic braking) from the secondary component of the binary. Using a three-dimensional hydrodynamic fluid code based on the free Lagrange method, we study the loss of specific angular momentum from a binary system due to an evaporative wind from the companion of a millisecond pulsar. We consider binaries of different mass ratios and winds of different initial velocities and in particular attempt to model the system PSR 1957+20. We are in the process of incorporating the effect of the radiation force from the pulsar and the magnetic field of the companion on the mass outflow. The latter effect would also enable us to study magnetic braking in cataclysmic variables and low-mass X-ray binaries. Author

EVOLUTION OF PROTOPLANETARY DISKS WITH DYNAMO MAGNETIC FIELDS Abstract Only

M. Reyes-Ruiz and Tomasz F. Stepinski *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 6-7 (For primary document see N94-31116 09-90)

Avail: CASI HC A01/MF A01

The notion that planetary systems are formed within dusty disks is certainly not a new one; the modern planet formation paradigm is based on suggestions made by Laplace more than 200 years ago. More recently, the foundations of accretion disk theory where initially developed with this problem in mind, and in the last decade astronomical observations have indicated that many young stars have disks around them. Such observations support the generally accepted model of a viscous Keplerian accretion disk for the early stages of planetary system formation. However, one of the major uncertainties remaining in understanding the dynamical evolution of protoplanetary disks is the mechanism responsible for the transport of angular momentum and subsequent mass accretion through the disk. This is a fundamental piece of the planetary system genesis problem since such mechanisms will determine the environment in which planets are formed. Among the mechanisms suggested for this effect is the Maxwell stress associated with a magnetic field treading the disk. Due to the low internal temperatures through most of the disk, even the question of the existence of a magnetic field must be seriously studied before including magnetic effects in the disk dynamics. On the other hand, from meteoritic evidence it is believed that magnetic fields of significant magnitude existed in the earliest, PP-disk-like, stage of our own solar system's evolution. Hence, the hypothesis that PP disks are magnetized is not made solely on the basis of theory. Previous studies have addressed the problem of the existence of a magnetic field in a steady-state disk and have found that the low conductivity results in a fast diffusion of the magnetic field on timescales much shorter than the evolutionary timescale. Hence the only way for a magnetic field to exist in PP disks for a considerable portion of their lifetimes is for it to be continuously regenerated. In the present work, we present results on the self-consistent evolution of a turbulent PP disk including the effects of a dynamo-generated magnetic field.

THEORY OF PROTOSTELLAR ACCRETION DISKS Abstract Only

S. Ruden *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 8 (For primary document see N94-31116 09-90)

Avail: CASI HC A01/MF A01

I will present an overview of the current paradigm for the theory of gaseous accretion disks around young stars. Protostellar disks form from the collapse of rotating molecular cloud cores. The disks evolve via outward angular momentum transport provided by several mechanisms: gravitational instabilities, thermal convective turbulence, and magnetic stresses. I will review the conditions under which these mechanisms are efficient and consistent with the observed disk evolutionary timescales of several million years. Time permitting, I will discuss outbursts in protostellar disks (FU Orionis variables), the effect of planet formation on disk structure, and the dispersal of remnant gas. Author

THERMAL CONTINUA OF AGN ACCRETION DISKS Abstract Only

G. A. Shields and H. H. Coleman *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 8 (For primary document see N94-31116 09-90)

Avail: CASI HC A01/MF A01

We have computed the thermal continuum energy distribution of thermal radiation from the atmospheres of supermassive accretion disks around supermassive black holes. Non-LTE radiative transfer is combined with a model of the vertical structure at each radius appropriate to the low effective gravities of these disks. Locally, the Lyman edge of H can be in emission or absorption. When the emission is summed over the disk with Doppler and gravitational redshifts taken into account, the observed continuum typically shows little sign of a discontinuity near the Lyman edge. For relatively cool disks, the Lyman edge is in absorption, but it appears as a slope change extending over several hundred angstroms, rather than an abrupt discontinuity. Disks around Kerr black holes can explain the observed range of soft X-ray luminosities of AGN, but disks around Schwarzschild holes are much too faint in soft X-rays. Author (revised)

EVOLUTION OF DYNAMO-GENERATED MAGNETIC FIELDS IN ACCRETION DISKS AROUND COMPACT AND YOUNG STARS Abstract Only

Tomasz F. Stepinski *In its* Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 8-9 (For primary document see N94-31116 09-90)

Avail: CASI HC A01/MF A01

Geometrically thin, optically thick, turbulent accretion disks are believed to surround many stars. Some of them are the compact components of close binaries, while the others are throught to be T Tauri stars. These accretion disks must be magnetized objects because the accreted matter, whether it comes from the companion star (binaries) or from a collapsing molecular cloud core (single young stars), carries an embedded magnetic field. In addition, most accretion disks are hot and turbulent, thus meeting the condition for the MHD turbulent dynamo to maintain and amplify any seed field magnetic field. In fact, for a disk's magnetic field to persist long enough in comparison with the disk viscous time it must be contemporaneously regenerated because the characteristic diffusion time of a magnetic field is typically much shorter than a disk's viscous time. This is true for most thin accretion disks. Consequently, studying magentic fields in thin disks is usually synonymous with studying magnetic dynamos, a fact that is not commonly recognized in the literature. Progress in studying the structure of many accretion disks was achieved mainly because most disks can be regarded as two-dimensional flows in which vertical and radial structures are largely decoupled. By analogy, in a thin disk, one may expect that vertical and radial structures of the magnetic field are decoupled because the magnetic field diffuses more rapidly to the vertical boundary of the disk than along the radius. Thus, an asymptotic method, called an adiabatic approximation, can be applied to accretion disk dynamo. We can represent the solution to the dynamo equation in the form $B = Q(r)b(r,z)$, where Q(r) describes the field distribution along the radius, while the field distribution across the disk is included in the vector function b, which parametrically depends on r and is normalized by the condition $\max(b(z)) = 1$. The field distribution across the disk is established rapidly, while the radial distribution Q(r) evolves on a considerably longer timescale. It is this evolution that is the subject of this paper. NONTHERMAL ACCRETION DISK MODELS AROUND NEUTRON STARS Abstract Only

M. Tavani and Edison P. Liang *In* Lunar and Planetary Inst., Workshop

on Physics of Accretion Disks Around Compact and Young Stars 1994 p 9 (For primary document see N94-31116 09-90)
Avail: CASI HC A01/MF A01

We consider the structure and emission spectra of nonthermal accretion disks around both strongly and weakly magnetized neutron stars. Such disks may be dissipating their gravitational binding energy and transferring their angular momentum via semicontinuous magnetic reconnections. We consider specifically the structure of the disk-stellar magnetospheric boundary where magnetic pressure balances the disk pressure. We consider energy dissipation via reconnection of the stellar field and small-scale disk turbulent fields of opposite polarity. Constraints on the disk emission spectrum are discussed. Author

The nonaxisymmetric stability of self-gravitating, geometrically thick accretion disks has been studied for protostellar systems having a wide range of disk-to-central object mass ratios. Global eigenmodes with four distinctly different characters were identified using numerical, nonlinear hydrodynamic techniques. The mode that appears most likely to arise in normal star formation settings, however, resembles the 'eccentric instability' that was identified earlier in thin, nearly Keplerian disks: It presents an open, one-armed spiral pattern that sweeps continuously in a trailing direction through more than 2-pi radians, smoothly connecting the inner and outer edges of the disk, and requires cooperative motion of the point mass for effective amplification. This particular instability promotes the development of a single, self-gravitating clump of material in orbit about the point mass, so its routine appearance in our simulations supports the conjecture that the eccentric instability provides a primary route to the formation of short-period binaries in protostellar systems. We have developed a tool to solve the radiative transfer equation for a three-dimensional astrophysical object on the SIMD computer MasPar MP-1. With this tool we can rapidly calculate the image of such an object as seen from an arbitrary direction and at an arbitrary wavelength. Such images and spectra can then be used to directly compare observations with the model. This tool can be applied to many different areas in astrophysics, e.g., HI disks of galaxies and polarized radiative transfer of accretion columns onto white dwarfs. Here we use this tool to calculate the image and spectrum of a simple model of an accretion disk. Author

The study of magnetized plasmas in astrophysics is complicated by a number of factors, not the least of which is that in considering magnetic fields in stars or accretion disks, we are considering plasmas with densities well above those we can study in the laboratory. In particular, whereas laboratory plasmas are dominated by the confining magnetic field pressure, stars, and probably accretion disks, have magnetic fields whose beta (ratio of gas pressure to magnetic field pressure) is much greater than 1. Observations of the Sun suggest that under such circumstances the magnetic field breaks apart into discrete flux tubes with a small filling factor. On the other hand, theoretical treatments of MHD turbulence in high-beta plasmas tend to assume that the field is more or less homogeneously distributed throughout the plasma. Here we consider a simple model for the distribution of magnetic flux tubes in a turbulent medium. We discuss the mechanism by which small inhomogeneities evolve into discrete flux tubes and the size and distribution of such flux tubes. We then apply the model to accretion disks. We find that the fibrilation of the magnetic field does not enhance magnetic buoyancy. We also note that the evolution of an initially diffuse field in a turbulent medium, e.g., any uniform field in a shearing flow, will initially show exponential growth as the flux tubes form. This growth saturates when the flux tube formation is complete and cannot be used as the basis for a self-sustaining dynamo effect. Since the typical state of the magnetic field is a collection of intense flux tubes, this effect is of limited interest. However, it may be important early in the evolution of the galactic magnetic field, and it will play a large role in numerical simulations. Finally, we note that the formation of flux tubes is an essential ingredient in any successful dynamo model for stars or accretion disks.

THE PHYSICS OF BLACK HOLE X RAY NOVAE Abstract Only
J. C. Wheeler, S.-W. Kim, M. D. Moscoso, and S. Mineshige *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 11-12 (For primary document see N94-31116 09-90)
Avail: CASI HC A01/MF A01

X-ray transients that are established or plausible black hole candidates have been discovered at a rate of about one per year in the galaxy for the last five years. There are now well over a dozen black hole candidates, most being in the category of X-ray novae with low-mass companions. There may be hundreds of such transient systems in the galaxy yet to be discovered. Classic black hole candidates like Cygnus X-1 with massive companions are in the minority, and their census in the galaxy and magellanic clouds is likely to be complete. The black hole X-ray novae (BHXN) do not represent only the most common environment in which to discover black holes. Their time dependence gives a major new probe with which to study the physics of accretion into black holes. The BHXN show both a soft X-ray flux from an optically thick disk and a hard power law tail that is reminiscent of AGN spectra. The result may be new insight into the classical systems like Cyg X-1 and LMC X-1 that show similar power law tails, but also to accretion into supermassive black holes and AGN.

GAS DYNAMICS FOR ACCRETION DISK SIMULATIONS Abstract Only
R. Whitehurst *In* Lunar and Planetary Inst., Workshop on Physics of Accretion Disks Around Compact and Young Stars 1994 p 12 (For primary document see N94-31116 09-90)
Avail: CASI HC A01/MF A01

The behavior of accretion disks can largely be understood in terms of the basic physical processes of mass, energy, and momentum conservation. Despite this, detailed modeling of these systems using modern computational techniques is challenging and controversial. Disturbing differences exist between methods used widely in astrophysics, namely Eulerian finite-difference techniques and particle codes such as SPH. Therefore neither technique is fully satisfactory for accretion disk simulations. This paper describes a new fully Lagrangian method designed to resolve these difficulties. Author

THE STELLAR AND GASEOUS CONTENT OF MASSIVE LOW SURFACE BRIGHTNESS DISK GALAXIES Ph.D. Thesis
Patricia Marie Knezek 1993 321 p
Avail: Univ. Microfilms Order No. DA9316682

This dissertation presents a multi-wavelength study of a subset of an extreme type of galaxy, those which have low surface brightnesses, large disks, and large amounts of atomic gas, yet which have total dynamical masses similar to those of giant spiral galaxies. These systems may represent a significant, but largely unexplored, fraction of galaxies in the universe, and determining their star formation histories and evolution is critical to our attempts to understand the different modes of formation and evolution of all galaxies. Surface photometry at B and R, in conjunction with H(sub I), (sup 12)CO and far-infrared data, is used to try to determine if these galaxies had an early epoch of star formation that has since faded, have ongoing star formation with an unusual IMF, or are perhaps galaxies which have never efficiently formed stars due to a lack of molecular clouds. Results of our observations confirm earlier findings that these systems in general have very blue disks relative to higher surface brightness, gas-rich disk systems. This result makes it very difficult to explain these galaxies as 'faded disks.' Although they have prodigious amounts of H(sub I), there is little evidence of abundant (sup 12)CO or dust. Despite their physical similarities, they show an amazing variety of optical morphologies. Many have steep radial color gradients, perhaps due to changing metallicities. These systems tend to be in fairly isolated regions of the universe. The lack of nearby neighbors may have allowed them to form and evolve in a very different manner from typical high surface brightness galaxies. Some systems may, in fact, have undergone very little star formation over time. If this is true, this population could represent a valuable window into the early epochs of star formation in disk galaxies. Dissert. Abstr.

DOUBLE-LINED PRE-MAIN-SEQUENCE BINARIES: A TEST OF PRE-MAIN-SEQUENCE EVOLUTIONARY THEORY Ph.D. Thesis
Chi-Wai Lee 1992 105 p
Avail: Univ. Microfilms Order No. DA9304164

This thesis is to test the calibrations of theoretical pre-main-sequence (PMS) evolutionary models. We compare the theoretical masses and ages of the components of five double-lined pre-main-sequence binaries with the dynamical mass ratios and the assumption of coeval formation of binary components. The spectral types and luminosity ratios of the components are derived from comparisons of selected lines in the observed spectra with synthetic binary spectra created from spectral standards. These are based on echelle observations obtained during 1989-1990. Theoretical masses and ages of the components are obtained by comparing with the theoretical evolutionary models of Mazzitelli and VandenBerg. All five binaries have components with theoretical masses and ages consistent with the dynamical mass ratios and the assumption of coeval formation. We find no substantial problems with the relative mass calibrations of the theoretical tracks, nor the assumption of coeval formation of binary components. These hold for binaries with ages ranging from approximately 10(exp 6) yr to few times 10(exp 6) yr. Assuming coeval formation of binary components, we compare the ranges of both the theoretical mass ratios and the dynamical mass ratios with the detectable range of dynamical mass ratios. The results show that the ranges of theoretical mass ratios and the dynamical mass ratio are small subsets of the detectable range of dynamical mass ratios. This finding indicates that this analysis is a significant test of the relative mass calibrations of the PMS tracks of Mazzitelli and VandenBerg. The binary P1540 with age of approximately 10(exp 5) yr is the youngest in our sample. The maximum age difference for the solutions that have theoretical mass ratios consistent with the dynamical mass ratio is only a few times 10(exp 5) yr. This is small compared to the ages of few times 10(exp 6) yr of the other binaries in the sample. This indicates it is possible that processes such as disk accretions have little effects on the evolution of the binaries after approximately 10(exp 5) yr. Dissert. Abstr.

THE ORIGIN OF NEON-E: NEON-E IN SINGLE INTERSTELLAR SILICON CARBIDE AND GRAPHITE GRAINS Ph.D. Thesis
Robert Hill Nichols, Jr. 1992 158 p
Avail: Univ. Microfilms Order No. DA9317398

Anomalous noble gas components, such as Ne-E, measured in bulk SiC and graphite fractions separated from meteorites have previously supported the presolar origin of these mineral grains. These prior measurements, however, were performed on samples containing many thousands of grains; any result derived from such bulk measurements is only an average of the many, perhaps dissimilar, constituents. This work reports the first measurements of (sup 22)Ne-E and (sup 4)He in a suite of single micron-sized presolar SiC and graphite grains separated from the Murchison (CM) meteorite. The analyses were performed using a laser gas extraction technique and a high-sensitivity noble gas mass spectrometer. C- and N-isotopic compositions were determined via ion microprobe analyses on a subset of the suite of grains to further constrain their origin. This work confirms that SiC and graphite are the carriers of Ne-E(H) and Ne-E(L), respectively. Only 4 percent of the SiC grains and 30 percent of the graphite grains carry the anomalous gas above the spectrometer detection limits, implying that several inferences based on bulk noble gas measurements about the lifetimes of presolar grains and the abundances of these grains in meteorites should be reconsidered. That He-4 is found only in the Ne-E(H)-rich SiC grains provides strong evidence against a Na-22 origin of Ne-E(H). The He-4 and Ne-22 in the gas-rich SiC grains were probably produced either in the He-burning shell of low mass asymptotic giant branch (AGB) stars or in Wolf-Rayet stars during the WN-WC transition. Although the C-isotopic compositions of the gas-rich SiC grains argue against grain formation from pure He-shell material, AGB stars still appear to be the most plausible site for the formation of Ne-E(H). The graphite grains, which carry only (sup 22)Ne-E(L) without any He-4, probably formed from Wolf-Rayet stars near the WN-WC transition, with the Ne-E(L) being produced directly by the implantation of Ne. One gas-rich graphite grain, however, does not conform to a Wolf-Rayet origin. Although this grain could plausibly have formed from a nova with the Ne-E(L) being produced from the in situ decay of Na-22, the C-isotopic composition of this grain is inconsistent with such a scenario. The results of this work argue strongly against the popular belief that Ne-E(H) and Ne-E(L) are derived solely from the in situ decay of novae-produced Na-22. Dissert. Abstr.

N94-31566 Alabama Univ., Huntsville.
NUMERICAL SIMULATION OF INTERPLANETARY DYNAMICS Ph.D. Thesis
Chin-Chun Wu 1993 187 p
Avail: Univ. Microfilms Order No. DA9324492

This dissertation discusses investigations into the physics of the propagation of solar generated disturbances in the interplanetary medium. The motivation to initiate this study was two-fold: (1) understanding the fundamental physics of the nonlinear interactions of solar generated MHD shocks and non-homogeneous interplanetary medium, and (2) understanding the physics of solar generated disturbance effects on the Earth's environment, (i.e. the solar connection to the geomagnetic storm). In order to achieve these goals, the authors employed two numerical models to encompass these studies. In the first part, a one-dimensional MHD code with adaptive grids is used to study the evolution of interplanetary slow shocks (ISS), the interaction of a forward slow shock with a reverse slow shock, and the interaction of a fast shock with a slow shock. Results show that the slow shocks can be generated by a decreasing density, velocity or temperature perturbation or by a pressure pulse by following a forward fast shock and that slow shocks can propagate over 1 AU; results also show that the ISS never evolves into fast shocks. Interestingly, it is also found that an ISS could be 'eaten up' by an interplanetary fast shock (IFS) catching up from behind. This could be a reason that the slow shock has been difficult to observe near 1 AU. In addition, a forward slow shock could be dissipated by following a strong forward fast shock (Mach number greater than 1.7). In the second part, a fully three-dimensional (3D), time-dependent, MHD interplanetary global model (3D IGM) is used to study the relationship between different forms of solar activity and transient variations of the north-south component, B(sub x), of the interplanetary magnetic field, IMF, at 1 AU. One form of solar activity, the flare, is simulated by using a pressure pulse at different locations near the

solar surface and observing the simulated IMF evolution of B(sub theta) (= -B(sub x)) at 1 AU. Results show that, for a given pressure pulse, the orientation of the corresponding transient variation of B(sub x) has a strong relationship to the location of the pressure pulse and the initial conditions of the IMF. REACTIVE FLOWS IN COMPACT OBJECTS Ph.D. Thesis
Francis Xavier Timmes 1993 204 p
Avail: Univ. Microfilms Order No. DA9328224

This thesis examines aspects of subsonic reactive flows in stars. Highlighted are fluid flows in which the velocity of the fluid is much less than the local sound speed of the fluid, and where the thermodynamic conditions of the fluid are conducive to nuclear reactions. Reactive flows of this nature are capable of generating self-sustained flame fronts, also known as deflagration waves. An introductory chapter on the astrophysics of reacting flows commences this thesis, followed by four chapters which apply this physics to the interiors of compact objects. The bifurcation between accretion-induced collapse of a white dwarf to a neutron star, and the explosion of the white dwarf in a Type 1a supernovae event is the subject of the second chapter. The fate of the accreting white dwarf is critically dependent upon the propagation speed of the laminar flame front that is ignited near or at the center of the star. The physical properties (speed, width, and density recovery time) of subsonic flame fronts are calculated from first principles, and the resulting implications discussed. Chapter three extends the body of literature on the thermal conductivity due to collisions between relativistic degenerate electrons, and provides convenient expressions for evaluation of the electron-electron contribution to the total thermal conductivity. Merging white dwarfs offer another bifurcation point towards accretion-induced collapse and is the subject of chapter four. Here carbon burning is ignited at the surface of the accreting white dwarf, and propagates inwards toward the center of the dwarf. Collapse of the dwarf to a neutron star probably ensues if the flame propagates to the center. One finds that for each value of the gravitational potential, there is a minimum density (hence a minimum mass) below which the flame becomes quenched before it reaches the center of the white dwarf. Closure of this thesis is attained on a possibly exciting, and certainly speculative note. The development and initial testing of implicit smooth particle hydrocode, which may turn out to be useful for subsonic reactive flows in multiple dimensions, is presented. Dissert. Abstr.

EVOLUTION OF STARS AND WINDS IN THE STARBURST GALAXY M82 Ph.D. Thesis
Jay Scott Doane 1993 95 p
Avail: Univ. Microfilms Order No. DA9328208

Standard time-dependent equations for the conversion of gas into stars are used to generate model starbursts. Included are provisions for recycling of gas and heavy elements from evolved stars and the loss of matter in a wind driven by supernova explosions. Free parameters include the initial mass function (IMF), star formation rate (SFR), amount of initial star-forming gas, and the amount of gas ejected from each supernova. These are constrained by data from the well-observed starburst galaxy M82 such as the current supernova rate, current amount of dynamical mass in the burst region, bolometric and ionizing photon luminosity of the burst region, amount of gas ejected since the onset of starburst, x ray luminosity in the galactic halo, and pressure of the optical clouds in the halo. The last three constraints require that the outflowing gas from the burst region be modeled as it moves into the galactic halo. We treat the wind as a one dimensional steady state flow issuing from the starburst core, subject to radiative losses in the outer galaxy. Our core starburst model succeeds in easily matching most of the observations when we employ a truncated IMF such that no stars form with a mass less than three solar mass. We find we can also fit the relevant observational parameters with a normal Salpeter IMF, but the range of times that the models fit is narrow, and the initial parameters have to be fine tuned for the agreement. Also of interest is that our SFR must be much higher than is common in the local solar neighborhood. We are unable, within reasonable parametric limitations, to generate with our central-source model what has been formerly interpreted as an extended thermal x ray flux, in agreement with recent observations. It is possible that a two-episode outflow can explain a majority of the observations in the outer galaxy. A primary, relatively cool wind consisting of thermally unstable regions may be responsible for the optical line emission and x rays, while a later, similarly unstable yet hotter wind could be responsible for the reacceleration of the extended radio synchrotron electrons. STRONGLY COUPLED IONIC MIXTURES AND THE H/He EOS
H. E. DeWitt 2 Dec. 1993 19 p Presented at the Equation of State in Astrophysics Workshop, Saint-Malo, France, 14-18 Jun. 1993
(Contract W-7405-eng-48)
(DE94-006391; UCRL-JC-115805; CONF-9306287-2) Avail: CASI HC A03/MF A01

This paper summarizes recent work on the strongly coupled OCP and Binary Ionic Mixture equation of state and other thermodynamic quantities in white dwarf interior conditions for both fluid and solid phases with the assumption of a uniform background. Conditions for phase separation of different elements in fluid or solid phases is strongly dependent on deviations from the linear mixing rule which gives the equation of state as an additive function of the OCP equation of state. These deviations turn out to be small (a few parts in 10(exp 5)) and always positive including the case where the fraction of the higher Z component approaches 0. Also the equation of state of strongly coupled light elements (H and He particularly) obtained from simulations with a linear response description of the electrons is given for conditions appropriate to brown dwarf star interiors. Recent Livermore work on a band structure calculation of the enthalpy of H and He mixtures under jovian conditions is discussed. This work leads to a prediction of a high temperature (15,000 K) for miscibility of He in ionized H at 10 Mb. DOE

LINE-STRENGTH GRADIENTS AND KINEMATIC PROFILES IN ELLIPTICAL GALAXIES Ph.D. Thesis
Jose deJesusGonzalez-Gonzalez 1993 211 p
Avail: Univ. Microfilms Order No. DA9328211

The strength of several spectral features together with velocity dispersion and rotation were measured along the principal photometric axes of a sample of 40 elliptical galaxies. These line-strength and kinematic profiles were used to study the stellar population in these systems. The line-strength indices were measured with the Lick IDS system to compare the galaxy indices to model predictions for co-eval generations of stars as a function of age and metallicity. The IDS calibration yields the most comprehensive and up-to-date collection of models available. The Mg and Fe line-strengths indicate a high (Mg/Fe) abundance ratio in strong-lined galaxies relative to the calibrating stars. The Mg and Fe indices taken alone are not enough to separate the age and metallicity of composite stellar populations. The age-metallicity degeneracy has been broken in this study by including the H(sub beta) strength (a very age-sensitive index). The H(sub beta) index varies considerably among the galaxies while the more metallicity-sensitive indices do not vary as much. The well defined light-strength patterns in the galaxies reflect into remarkable age-metallicity trends when compared to the models. Taking the models as a reference, two specific conclusions are reached. First, although the mean stellar metallicity does not seem to vary significantly among strong and weak-lined galaxies (Delta bar-Z approximately less than 50 percent), these two types of galaxies are separated by a considerable age spread. The mean stellar age of weak-lined galaxies can be as small as approximately 4 to 6 Gyr, in contrast to ages of approximately 12 to 15 Gyr in strong-lined galaxies. And secondly, the typical H(sub beta) gradient is flat. The typical metallicity gradient reads to be Delta bar-Z/Delta log r approximately equal to -0.3, compared to a typical age gradient of Delta bar-age/Delta log r approximately equal to 3 Gyr per dex in radius (or approximately 40 percent at bar-age = 8 Gyr). If a population of old but blue stars contributes significantly to the optical light in weak-lined galaxies, their strong H(sub beta) absorption would not be an indication of a young age. Further observations in this direction are encouraged. Dissert. Abstr.

GRAVITATIONAL EFFECTS OF COSMIC STRINGS Ph.D. Thesis
Daniel Vollick 1992 161 p
(ISBN-0-315-75484-2) Avail: Univ. Microfilms Order No. DANN75484

Cosmic strings are line-like distributions of energy which may have formed in the early universe. Recent simulations of the evolution of cosmic

string networks show that strings have a significant amount of small scale structure (i.e. wiggles). In this thesis we will examine some of the gravitational effects produced by wiggly cosmic strings. One intriguing possibility is that cosmic strings produced the density perturbations which triggered the formation of galaxies and large-scale structure. Calculations by others which neglect the wiggles suggest that this scenario is ruled out. Using the Zel'dovich approximation and taking the wiggles into account I found that the wakes produced by the strings in cold dark matter can account for the observed large scale structure of the universe. Using the Gilbert equation I found that the size of the structure produced in hot dark matter is smaller but comparable to the size of the observed large scale structure. I also found that the wiggles can fragment the wakes into pieces which have the mass of a galaxy. One of the interesting observational effects of cosmic strings is the production of double images through gravitational lensing. The gravitational field of a wiggly string differs from the field of a straight string in that the curvature tensor outside a straight string is zero, whereas the curvature tensor diverges as one approaches a wiggly string. Could this make a significant observational difference? To examine this I calculated the effect of a wave pulse on the images of objects located behind the string and found that differences exist, but are small. Dissert. Abstr.

COMETARY MOLECULES Ph.D. Thesis
Weiguo Ge 1993 130 p
Avail: Univ. Microfilms Order No. DA9316652

A comprehensive model of the excitation and kinematics of cometary molecules has been developed and used to analyze data obtained on comet Levy (1990c). This work builds on previous studies to develop modes of the excitation and distribution of HCN and H2CO in the coma and to apply these modes to comet Levy in order to determine the physical parameters of the cometary coma and test models of the possible origin of H2CO in comets. The collision cross sections as a function of delta J have been considered in the excitation models for both molecules, based on quantum mechanical calculations. The vectorial model has been adopted for consideration of possible daughter species and a Monte Carlo calculation technique has been applied to develop both parent and daughter molecule models for H2CO so that we can calculate its production rate and discuss its original source. With the high quality of spectra for both HCN and H2CO molecules in comet Levy, we are able to use our models to constrain their abundance and some physical parameters of the coma. These new observational results confirm that microwave spectroscopy is an efficient tool to study cometary parent molecules, and help us understand the formation of our solar system. Dissert. Abstr.

STUDY OF STELLAR ASSOCIATIONS LOCATED IN THE REGION CONTAINED BETWEEN THE MAGELLANIC CLOUDS Ph.D. Thesis [ETUDE D'ASSOCIATIONS STELLAIRES SITUEES DANS LA REGION COMPRISE ENTRE LES NUAGES MAGELLAN]
Luc Grondin Dec. 1991 178 p In ENGLISH and FRENCH
(ISBN-0-315-86692-6; CTN-94-61221) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Fundamental characteristics that are required to understand the nature of the bridge linking the Magellanic Clouds were investigated. Photometry in the B, V, and I bands was applied to five stellar associations in the bridge allowing construction of a precise color-magnitude diagram for each association. The distance and age of these associations was determined along with the radial velocity of some of the stars. It was found that the five associations studied are found at distances on the order of 60 kiloparsecs (kpc), confirming that they belong to the Magellanic System. The age of the associations appears less than 16 million years, much younger than the time since the last hypothetical encounter between the Small and Large Magellanic Clouds. The stars were thus formed near their present position in a relatively tenuous medium. The initial mass function (IMF) has a less pronounced slope than that evaluated by Scalo for the system surrounding the Sun and by Mateo for a sample of Magellanic clusters. Nevertheless, it is comparable with the IMF obtained by Sagar and Richtler for five clusters in the Large Magellanic Cloud and that characterizing the open clusters of the Galaxy. A universal IMF hypothesis is thus favored. CISTI

PLANETESIMAL DYNAMICS IN THE VICINITY OF A GROWING PROTOPLANET Ph.D. Thesis
David Michael Kary 1993 305 p
Avail: Univ. Microfilms Order No. DA9328200

This thesis describes calculations of the systematic component of spin angular momentum accretion. It also covers work on the impact probability for planetesimals evolving towards a planet due to gas drag. The rotation studies assume that a spherical planet on a circular orbit accretes from a uniform density two dimensional disk of planetesimals. For a nongravitating planet, these calculations give prograde rotation of less than one rotation/year. When planetary gravity is included and the planetesimal eccentricity is low, the rotation is strongly retrograde. As eccentricity grows, the rotation becomes prograde, reaching a strong peak, and then dropping toward the nongravitating limit. The peak is comparable to observed rotation rates, but when planetesimal eccentricities have a Rayleigh distribution little prograde rotation is produced. However, the observed spin rates may result from nonuniformities in the planetesimal disk, specifically, a gap in planetesimal semimajor axes around the planet. This gives extra impactors from the extremities of the accretion cone which produce strongly prograde rotation. In the gas drag studies planetesimals approaching a protoplanet on a circular orbit are studied using three-body numerical integrations. Planetesimals originate on circular orbits external to the planet's orbit and usually coplanar with it. Particles larger than a given size become trapped at resonances with the planet. The stability of resonance locks depends on the proximity of other resonances and often on a period-doubling transition to chaos. For modern planet densities, only a small fraction of the material not trapped in resonances hits the planet. Planets with extended atmospheres dense enough to trap planetesimals accrete much more efficiently. At large decay rates, impact probabilities vary inversely with the drag parameter. Particles whose vertical motions are large compared to the planet's radius have impact probabilities which vary inversely with their orbital inclination. The rotation induced by particles which hit the planet depends on the drag rate. Low drag rates produce prograde rotation since planetesimals are accreted from the extremities of the accretion zone, while large drag rates produce retrograde rotation, since the planetesimals are accreted from anywhere in the accretion zone, and their eccentricities are low. STRUCTURE AND STABILITY OF SPHERICAL ACCRETION FLOWS ONTO COMPACT OBJECTS Ph.D. Thesis
John Charles Houck 1991 101 p
Avail: Univ. Microfilms Order No. DA9223411

We examine the structure of hypercritical accretion flows onto neutron stars, considering steady state, spherically symmetric flows with accretion rates in the range 10(exp -4) approximately less than M less than or equal to 10(exp 4) solar mass/yr. In this regime, the gravitational accretion energy is carried away by neutrinos. Our models include pair production, radiation diffusion, and general relativistic effects. At the lower accretion rates, free-fall toward the neutron star surface ceases and an extended, quasistatic radiation pressure supported envelope is present. This radiation pressure supported envelope is likely to be dynamically unstable. Applying these results to the case of SN1987A, we find that the luminosity at infinity from accretion onto a central neutron star should reach 50 percent of the Eddington luminosity within about six months of the explosion, approaching the Eddington luminosity within a year. We then examine the general structure and stability of spherical accretion flows onto compact objects. For simplicity, we assume that the cooling function has the form L varies as rho(exp beta - alpha) p(exp alpha). The dependence of the flow structure and stability on the accretion rate M, the form of the cooling function, and the ratio of specific heats (gamma) of the accreting material is discussed. We then discuss the application to post-supernova neutron star accretion flows and to observations of quasiperiodic variations in the x ray and optical emission from accreting white dwarfs in AM Her binaries. Post-supernova neutron star accretion flows are marginally unstable against radial shock oscillations. The nonlinear evolution of these oscillations may be an important aspect of the emergence of the neutron star from this accretion envelope. The parameter space over which white dwarf accretion shocks are unstable may be further extended by the existence of unstable nonradial oscillation modes. Because these modes can have oscillation periods ranging from

approximately 1 to 10 s, they are of interest in connection with both optical and x ray quasiperiodic oscillations observed in AM Her systems.

COMPOSITION AND PROPERTIES OF DUST FROM COMET HALLEY Ph.D. Thesis
Mark E. Lawler 1993 219 p
Avail: Univ. Microfilms Order No. DA9326371

A study of the elemental and morphological properties of cometary dust is made using elemental composition data from the PUMA and PIA impact mass spectrometers that analyzed Comet Halley's dust on flyby missions in 1986. The study is unique in its special rigorous selection procedures and its resulting high quality data sets, the largest of which contains mass spectra from 279 dust particles. The results include findings that anhydrous mafic silicates, many rich in Mg composition, are a predominant and ubiquitous constituent of cometary dust. Iron sulfides are probably also a common constituent. Both silicates and sulfides occur as mineral grains smaller than the typical particle size, and they are mixed intimately with abundant organic 'CHON' material. Sulfates and carbonates that would be produced by aqueous alteration seem to be very rare or nonexistent. Compositional dispersions of the major rock-forming elements in the cometary dust are quite unlike those seen in carbonaceous chondrites and serpentine-dominated hydrous interplanetary particles. The Halley data show evidence for olivines and low-Fe silicates that are absent from the hydrous smectite layer-silicate class of interplanetary particles, and this type of IDP also appears unlikely to be cometary material. The overall compositional dispersions in Halley's dust appear most similar to the anhydrous, porous chondritic class of interplanetary dust particles, lending additional support to the belief that this class of interplanetary particle has a cometary origin. Several lines of evidence indicate that extensive sublimation of volatile organic material in the dust occurs up to approximately 40,000 km from the comet nucleus, resulting in declining organic fractions in dust populations more distant from the nucleus. Sublimation may lead to fragmentation of the dust and elimination of the larger particles beyond this radius. Limited evidence has been found that published estimates of PUMA and PIA dust particle masses are too high by at least two orders of magnitude. The data appear consistent with a Greenberg-type model of organic CHON mantles on constituent silicate grains if sublimation of volatiles operates and produces the observed high variability in CHON-to-silicate composition. IONIZED GAS IN THE HALOS OF EDGE-ON INFRARED-BRIGHT GALAXIES: EVIDENCE FOR STARBURST-DRIVEN SUPERWINDS Ph.D. Thesis
Matthew David Lehnert 1993 326 p
Avail: Univ. Microfilms Order No. DA9327629

Large scale, starburst driven outflows from galaxies ('superwinds') have a rich legacy in theoretical astrophysics and have been invoked to explain many aspects of galactic formation and evolution. Such winds should arise when the supernova rate is high enough to create a cavity of very hot shock-heated gas within a galaxy. This gas can then expand outward as a high speed wind that can accelerate and heat ambient interstellar or circum-galactic gas causing it to emit optical line radiation and/or thermal x rays. Theory suggests that such winds should be common in starburst galaxies and the nature of the winds should depend on the star formation rate and distribution. In order to systematize our observational understanding of superwinds (determine their incidence rate and the dependence of their properties on the star formation that drives them) and to make quantitative comparisons with the theory of superwinds, we have analyzed data from an optical spectroscopic and narrow-band imaging survey of an infrared flux-limited sample of about 50 IR-warm, starburst galaxies whose stellar disks are viewed nearly edge-on. This sample contains galaxies with infrared luminosities from approximately equal to 10(exp 10 to 12) solar luminosity and allows us to determine the properties of superwinds over a wide range of star formation rates. We have found that extra-planar emission-line gas is a very common feature of these edge-on, IR-bright galaxies and the properties of the extended emission-line gas are quantitatively consistent with the superwind theory. These properties are: radial pressure profiles that fall as approximately r(exp -2), pressures in the nuclei of these galaxies that are three orders of magnitude higher than the ambient pressure in the ISM of our galaxy, line ratios becoming more shock-like as one proceeds out along the galaxy minor axis, extra-planar filamentary and shell-like emission-line morphologies on scales of 100 s of pc to 10 s of Kpc, and the kinematic signatures of an outflow whose velocity is related to the star formation rate. Dissert. Abstr.

HYDRODYNAMICS OF NEUTRON STAR INTERIORS AND LABORATORY SUPERFLUIDS Ph.D. Thesis
Tassilo Andreas Reisenegger 1993 124 p
Avail: Univ. Microfilms Order No. DA9325384

This thesis contains the following papers: (1) A new class of g-modes in neutron stars. In the fluid core of a neutron star, the ratio of the number densities of charged particles (protons and electrons) to neutrons is an increasing function of the mass density. This composition gradient stably stratifies the matter, giving rise to g-modes with periods ranging upward from a few milliseconds. Some of these modes are computed and their damping mechanisms are discussed. (2) Magnetic field decay in isolated neutron stars: We investigate mechanisms that promote the loss of magnetic flux from an isolated neutron star. Ambipolar diffusion involves a drift of the magnetic field and charged particles relative to the neutrons, opposed by frictional drag. Variants of it include both the buoyant rise and the dragging by superfluid neutron vortices of magnetic flux tubes. The charged particle flux decomposes into a solenoidal and an irrotational component. The irrotational component perturbs the chemical equilibrium, generating pressure gradients that effectively choke it. The solenoidal component can transport magnetic flux from the outer core to the crust on a short timescale. Flux that threads the inner core is permanently trapped unless particle interactions can rapidly smooth departures from chemical equilibrium. We speculate that Hall drift may lead to a turbulent cascade of the magnetic field in the solid crust, terminated by ohmic dissipation at small scales. (3) The spin-up problem in helium 2: The laminar spin-up of helium 2 is studied by solving the linearized two-fluid equations in a simple case. No direct interactions between vortex lines and container walls are included. Two mechanisms are identified for the transfer of angular momentum from the container to the interior fluid. Both involve a poloidal secondary flow. An analytic expression for the spin-up time is found. Dissert. Abstr.

THE CHEMICAL AND DYNAMICAL EVOLUTION OF THE GALAXY Ph.D. Thesis
Tammy Ann Smecker-Hane 1993 305 p
Avail: Univ. Microfilms Order No. DA9327664

I develop theoretical models of the chemical and dynamical evolution of galaxies and present a galactic structure survey-invaluable tools for uncovering the history of the formation of our galaxy. Important advances in my theoretical models are noninstantaneous recycling of newly synthesized elements such as iron from Type Ia supernovae (mergers of white dwarf binaries). I incorporate Type Ia supernovae in models of baryonic dark matter as stellar remnants. If dark halos consist mainly of white dwarfs, as has been proposed, then an excessive supernovae rate is predicted unless the binary fraction was virtually zero. The observed chemical abundance ratios of halo stars signify enrichment from only Type II supernovae. I explore the timescale for the onset of Type Ia supernovae as an upper-limit to the timescale of halo formation. The apparent inconsistency between differences in ages of halo stars (2 to 3 Gyr) and timescale inferred from Type Ia supernovae (approximately less than 0.1 Gyr) suggests galaxies formed from hierarchical substructure. I calculate chemical and dynamical evolution models of viscous disks with noninstantaneous recycling. Patterns of element ratios and scatter in the age-metallicity relationship are predicted throughout the disk. Characterized by radial flows of gas, these models are ideal for exploring new ideas on creating the galactic bulge from disk inflow. The high metallicity of bulge stars may not require an ad hoc variation of the stellar initial mass function if inflow alters the apparent yields in the bulge and solar neighborhood. I present an unbiased, magnitude-limited spectroscopic survey of F-G stars. Radial velocities accurate to approximately less than 10 km/s are derived and compared with predictions of galactic structure models. Distances are derived by photometric parallax, and three dimensional velocities are calculated using published proper motions. Calibration of spectral line strengths against metallicity is presented for standard stars. Evaluation of metallicities of program stars is forthcoming. These data will be useful for constraining

the existence of a metallicity gradient in the galactic halo, and determining correlations between kinematics and chemistry in the disk/halo transition.

A STUDY OF PHYSICAL CONDITIONS, RADIATIVE TRANSFER AND SHOCKS IN THE INTERSTELLAR MEDIUM Ph.D. Thesis
Cheng-Hsuan Lyu 1993 157 p
Avail: Univ. Microfilms Order No. DA9318378

Two basic physical problems due to radiative transfer and time-dependent shocks are explored. In the first problem, a detailed statistical equilibrium model dealing with the radiative transfer in the interstellar molecular clouds is developed. An improved treatment of the radiation field, including the 2.73 K background radiation field, is incorporated. This model is applied in an analysis of ultraviolet high dispersion (R approx. 8.6 x 10(exp 4)) echelle observations of molecular CO obtained with the Goddard High Resolution Spectrograph aboard the Hubble Space Telescope. Specifically, for the xi Per clouds, synthetic spectra were computed and fitted to the observed CO (2-0) and (3-0) bands in the A (sup 1)II - X (sup 1)sigma(+) system. Derived populations of the C I ground-state fine-structure levels and the Co ground-state rotational levels were used to derive densities of two of the three, and possibly four, detected cloud components. The velocity component displaying the strongest C I absorption reveals extraordinarily high pressure (P/k greater than 4.0 x 10(exp 4) cm(exp -3) K). For the xi Oph clouds, the computed relative populations of the 6 lowest rotational levels of CO, based upon the statistical equilibrium model, together with multiple Voigt profile fits were determined to reproduce successfully the observations of the rotational structure of the (5-0) and (6-0) bands in (12)C(16)O and (13)C(16)O. The abundance of Co is found to be (1.88 +/- 0.25) x 10(exp 15) cm(exp -2), and the isotope ratio of (12)C(16)O/(13)C(16)O is approximately 79 +/- 22. In the second interstellar shock problem, we find that the photoionization by the EUV/UV (including soft X-ray) flux from both the central Of star and the surrounding hot gas plasma is a significant mechanism in determining the dynamical processes in the interstellar bubble, where the He II emission should be observable. Shock ionization and photoionization by X-rays originating from the central hot O star are responsible for producing this emission. Furthermore, from an expanding supershell model, we find that the local cloud (less than or equal to 10 pc) at the periphery of Loop I is affected by a recent (less than or equal to 10(exp 5) years) supernova, and the shock velocity (the expansion velocity) is approximately 15 km s(exp -1). This cloud is substantially ionized where the ionization fraction of hydrogen is approximately 66 percent and that of helium is 36 percent. Dissert. Abstr.

A MULTI-FREQUENCY STUDY OF AN X RAY SELECTED SAMPLE OF ACTIVE GALACTIC NUCLEI Ph.D. Thesis
Bruce Alan Grossan 1992
Avail: Issuing Activity (MIT Libraries, Rm. 14-0551, Cambridge, MA 02139-4307)

The LASS (Large Area Sky Survey) experiment, which flew aboard the HEAO-1 spacecraft, carried out a 2-20 keV survey of the sky during 1977-1978. The X-ray sources from this survey make up the LASS catalog (Wood et al. 1979). Optical counterparts have been identified for greater than 86 percent of the LASS sources above a flux of approx. 0.95 microns (mu)Jy Q 5 keV (Remillard 1992b). The LASS error boxes, along with the more precise positions from the Modulation Collimator (MC) X-ray experiment (also aboard HEAO-1), subsequent X-ray imaging, and optical search techniques were all used to identify the LASS sources. From these identifications, a high-latitude (absolute value of b greater than 20 deg.), flux limited (greater than or equal to 0.95 (mu)Jy) sample of 96 emission line Active Galactic Nuclei (AGN) have been selected for study. The sample is referred to as the LMA (for the LASS/MC identified sample of AGN). The objective of this work is to produce multi-frequency spectra of this sample of objects, in order to determine and interpret the statistical properties of the sample over nearly the full range of observable wavelengths. Data were obtained for as much of the radio through hard X-ray (less than 20 keV) spectrum as possible for each object in the LMA. Radio, near infrared, and other measurements were taken from the literature, far IR fluxes were extracted from co-added observations from IRAS, UV spectra were obtained from the IUE archives, and original observations were performed (with the help of collaborators) in the radio, near IR, optical, UV, and X-ray to fulfill this goal. Correlation studies of the continuum bands found poor correlations of X-ray and radio flux, good correlations for 12 and 26 micron flux with X-ray flux, excellent correlations for optical and near IR fluxes with X-rays, and poor correlations of UV and X-ray fluxes. Correlation studies of the line and X-ray continuum flux yield a good correlation between the flux of (OIII), the strongest narrow emission line, and X-ray flux. The hard X-ray Luminosity Function (LF) of the LMA can be roughly described by a power law of slope -2.49 plus or minus 0.02 from 10(exp 42)-10(exp 48) erg s(exp -1), but the function steepens with increasing luminosity.

THE MANIFESTATIONS OF ENERGETIC ACTIVITY IN THE GALACTIC CENTER Ph.D. Thesis
Keven Isao Uchida 1993 281 p
Avail: Univ. Microfilms Order No. DA9319823

The Galactic center region exhibits anomalous gas motions that may either indicate the radial ejection of gas due to a energetic central outburst or, alternatively, orbital motion in a non axisymmetric central potential, such as that of a bar. The purpose of this dissertation has been to explore these alternatives by examining new evidence of energetic activity in the Galactic center region. Particular emphasis has been placed on the unusual infrared hotspot AFGL 5376 and the radio continuum shell G359.1-0.5. What these objects have in common, and what has drawn attention to them, is their association with prominent molecular gas features extending well out of the Galactic plane. The nonthermal shell G359.1-0.5 is completely ringed by one such massive protrusion. AFGL 5376 is associated with another -- a well-defined, 90-pc spur of gas. This dissertation also reports on a new set of far-infrared continuum structures (the IR Spurs) which, like the molecular features, extend away from the Galactic plane. The data which have been acquired and analyzed for this investigation include (1) millimeter-wave molecular line ((12)CO J = 2-1 and 1-0) observations of AFGL 5376 and G359.1-0.5, (2) lambda 21 cm neutral hydrogen line and continuum observations toward G359.1-0.5, and (3) 12, 25, 60 and 100 microns IRAS images of the 'IR Spurs'. In addition, a kinematic code was developed to model the expansion of, and the effects of Galactic shear on the localized molecular ring associated with and surrounding G359.1-0.5. The energy output from a star cluster composed of nearly 200 O-type stars is apparently needed to account for the expansion of the ring. AFGL 5376 provides strong evidence of a recent major release of energy from the Galactic center; it is the locus of a large-scale vertical shock which bisects the entire length of its associated molecular spur. It is most readily understood in terms of explosion-induced expansion motions from the nucleus. A central energy release is the favored hypothesis for the observed anomalous gas motions, although the response of the gas to a bar remains a viable alternative. Dissert. Abstr.

THE KINEMATICS OF DENSE CLUSTERS OF GALAXIES Ph.D. Thesis
Ann I. Zabludoff 1993 180 p
Avail: Univ. Microfilms Order No. DA9318699

To obtain the distribution of cluster velocity dispersions (sigma), we have measured redshifts in the fields of the 31 R greater than or equal to 1 Abell clusters with 0.02 less than or equal to z less than or equal to 0.05. At least 10 fields are contaminated by superimposed velocity peaks. We extract 25 dense clusters with sigma greater than or equal to 300 km s(exp -1) and with surface number densities one deviation above the mean for the Great Wall. From the CfA Redshift Survey, we obtain a volume-limited catalog of 31 groups with sigma greater than or equal to 100 km s(exp -1) and with the same surface density limit as for the clusters. By combining the two distributions, we obtain a well-defined sample over a wide range of dispersions. The groups compensate for incompleteness in the Abell catalog at low sigma. The Abell clusters populate the high-sigma tail. At sigma approximately equal to 700 km s(exp -l), the group and cluster distributions are consistent. The combined distribution is consistent with x-ray temperature distribution functions. We compare the distribution of sigma with those predicted by theoretical models of large-scale structure. The models include Gaussian and non-Gaussian initial conditions, different power spectra, flat and open cosmologies, and unbiased and biased galaxy formation. Open and biased Gaussian models predict a distribution with too steep a slope the normalizations of unbiased models tend to be too high. Skew-positive and broad models are most successful at reproducing

the data, skew-negative models are the worst. To examine the individual kinematics of well-sampled clusters, we develop a method for detecting departures from a Gaussian velocity distribution in systems with approximately 100-200 measured redshifts. We decompose the velocity distributions of eight clusters into sums of the orthogonal Gauss-Hermite functions. This method quantifies the asymmetric 3rd-order and symmetric 4th-order terms of each distribution while minimizing the effect of interlopers in the tails. Dissert. Abstr.

WINDS FROM DISKS IN COMPACT BINARIES
C. W. Mauche 27 Oct. 1993 13 p Presented at the 105th Annual Meeting of the Astronomical Society of the Pacific, San Diego, CA, 10-15 Jul. 1993
(Contract W-7405-eng-48)
(DE94-007452; UCRL-JC-115464; CONF-9307167-1) Avail: CASI HC A03/MF A01

We herein present an observational and theoretical review of the winds of compact binaries. After a brief consideration of the accretion disk coronae and winds of X-ray binaries, the review concentrates on the winds of cataclysmic variables (CV's). Specifically, we consider the related problems of the geometry and mass-loss rate of the winds of CV's, their ionization state and variability, and the results from studies of eclipsing CV's. Finally, the properties of bona fide accretion disk wind models are reviewed. DOE

A STUDY OF THE NEUTRAL HYDROGEN DISTRIBUTION OF THE MILKY WAY THROUGH 21 cm EMISSION AND LYMAN ALPHA ABSORPTION Ph.D. Thesis
Athanassios Diplas 1992 171 p
Avail: Univ. Microfilms Order No. DA9304149

The focus of the thesis is the distribution of neutral hydrogen in the galactic disk and halo. The thesis consists of two projects. The first project is the study of the warp of the outer galaxy, via 21 cm emission. The second project deals with the H I distribution as derived from Ly alpha studies of stars hotter than B2 with the IUE. In the first part, we have used the Bell Laboratories Northern Hemisphere H I survey data of Stark and coworkers. These measurements are well suited for investigations of faint galactic H I emission because the sidelobe contamination of the data is low. We present a series of contour maps of n(sub H). The measurements permit us to probe with reliability the nature of the galactic warp and the extension of the gas to large z in the outer galaxy. For moderate R, the z distribution of the H I is complicated and reveals the existence of a confined component and an extended component. When viewed from the position of the sun, the warped and flaring outer galaxy extends to galactic latitudes as large as +25 degrees. In the second part of the thesis we studied the galactic interstellar H I distribution by analyzing existing absorption line data towards the complete sample of 554 B2 and hotter stars observed at high resolution with the IUE. This study more than doubles the number of lines of sight previously observed. We corrected the measured values of N(H I) for stellar contamination, and discarded approximately 40 percent of the B stars. The final working sample includes 388 stars. We present statistical averages for a number of quantities derived for the sample and study the changes in the H I to dust ratios with distance absolute value of z and with n(sub (H I)). The distribution of the gas away from the galactic plane is complex. Dissert. Abstr.

ORGANIC ANALYSES OF THE MURCHISON METEORITE Ph.D. Thesis
George Cooper 1993 98 p
Avail: Univ. Microfilms Order No. DA9320585

Many compounds yielding clues to the organic chemistry and molecular composition of the early solar system have been identified in the Murchison meteorite. Among these are amino acid precursors: carboxy lactams, lactams, N-acetyl amino acids, and amino acid hydantoins (5-substituted hydantoins). Also found were precursors of acids: dicarboxylic acid mono amides, carboxylic acid amides, and cyclic imides. Precursors of hydroxy acids, hydroxy amides, are also numerous. Organic phosphorus compounds are reported. The corresponding organic sulfur compounds, sulfite, and water soluble and insoluble phosphate are also present. Laboratory experiments have indicated that unusual cyanate chemistry was possibly responsible for the formation of at least some of the amino and carboxylic acid precursors. A plausible mode of formation of the organic phosphorus and sulfur compounds, alkyl phosphonic and alkyl sulfonic acids, respectively, suggests a direct link between identified interstellar molecules and aqueous chemistry on the meteorite parent body. The compounds were extracted under gentle conditions to avoid, as much as possible, decomposition during extraction. The procedure included extraction of a powdered sample with room temperature water, cation and anion exchange chromatography, derivatization with the reagent N-methyl- N-(tert-butyl dimethyl silyl) trifluoro acetamide (MTBSTFA), and analysis by gas chromatography-mass spectrometry (GCMS) and high performance liquid chromatography (HPLC). THE EVOLUTIONARY STATUS OF PSR 1259-63
L. Cominsky Dec. 1993 4 p Presented at the 4th Maryland Conference on Astrophysics, College Park, MD, 11-13 Oct. 1993
(Contract DE-AC03-76SF-00515)
(DE94-007094; SU-SLAC-PUB-6405; CONF-9310283-1) Avail: CASI HC A01/MF A01

The PSR 1259-63 system is unique in that it is the first radio pulsar found to be in a binary system with a massive main sequence companion. As such, it may be the evolutionary missing link connecting the radio pulsars to the X-ray emitting Be binaries. In this paper, we consider the conditions under which PSR 1259-63 may be the progenitor of the less eccentric, more slowly rotating X-ray Be binaries such as 4U0115+63, A0535+26, and A0538-66. Scenarios invoking the interaction of the pulsar with the stellar wind of the companion are proposed to account for the rapid spin-down phase that must occur in this system if it is evolutionarily linked to accreting X-ray binaries. The unexpected X-ray emission observed from PSR 1259-63 may indicate that the interaction between the pulsar and the Be star occurs at greater distances and produces a greater spin-down efficiency than was previously calculated. TRANSVERSE ENERGY PRODUCTION WITH Si AND Au BEAMS AT AGS ENERGY: TOWARDS HOT AND DENSE HADRONIC MATTER
J. Barrette (McGill Univ., Montreal, Quebec.) 1993 5 p Presented at the 10th International Conference on Ultra-Relativistic Nucleus-nucleus Collisions, Borlaenge, Sweden, 20-24 Jun. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC02-76CH-00016)
(DE94-007178; BNL-49968; CONF-930636-12) Avail: CASI HC A01

One of the main goals of the present heavy-ion reaction studies at the AGS and CERN is the understanding of the space-time evolution of the particle and energy density produced in such collisions. These are necessary ingredients if one wants to understand quantitatively the properties of matter at high temperature and density. In that respect, the study of inclusive global variables such as the transverse energy distribution gives valuable information on the reaction dynamics and, albeit indirectly, on the energy and baryon density reached in nucleus-nucleus collisions. In the spring of 1992, the AGS produced the first beam of very heavy ions, more specifically a beam of 11.4 GeV/c per nucleon Au-197. This is an important step for the field since it gives a first glimpse as to how the reaction dynamics evolves as the mass and volume of colliding systems reach the largest value that will be available in the future. The authors have used part of the E814 experimental set-up to study the transverse energy distribution produced in Au induced collisions. These data can be compared to similar data obtained with lighter beams and thus provide for the first time information on how the E(sub T) distribution evolves with the mass of the system as one reaches very large systems. CONVECTION IN TYPE 2 SUPERNOVAE Ph.D. Thesis
D. S. Miller 15 Oct. 1993 129 p
(Contract W-7405-eng-48)
(DE94-009373; UCRL-LR-115467) Avail: CASI HC A07/MF A02

Results are presented here from several two dimensional numerical calculations of events in Type 2 supernovae. A new 2-D hydrodynamics and neutrino transport code has been used to compute the effect on the supernova explosion mechanism of convection between the neutrinosphere

and the shock. This convection is referred to as exterior convection to distinguish it from convection beneath the neutrinosphere. The model equations and initial and boundary conditions are presented along with the simulation results. The 2-D code was used to compute an exterior convective velocity to compare with the convective model of the Mayle and Wilson 1-D code. Results are presented from several runs with varying sizes of initial perturbation, as well as a case with no initial perturbation but including the effects of rotation. The M&W code does not produce an explosion using the 2-D convective velocity. Exterior convection enhances the outward propagation of the shock, but not enough to ensure a successful explosion. Analytic estimates of the growth rate of the neutron finger instability are presented. It is shown that this instability can occur beneath the neutrinosphere of the proto-neutron star in a supernova explosion with a growth time of approximately 3 microseconds. The behavior of the high entropy bubble that forms between the shock and the neutrinosphere in one dimensional calculations of supernova is investigated. It has been speculated that this bubble is a site for gamma-process generation of heavy elements. Two dimensional calculations are presented of the time evolution of the hot bubble and the surrounding stellar material. Unlike one dimensional calculations, the 2D code fails to achieve high entropies in the bubble. When run in a spherically symmetric mode the 2-D code reaches entropies of approximately 200. When convection is allowed, the bubble reaches approximately 60 then the bubble begins to move upward into the cooler, denser material above it. DOE

THE ROLE OF GALAXY TYPE AND ENVIRONMENT IN DETERMINING THE PROPERTIES OF GLOBULAR CLUSTER SYSTEMS Ph.D. Thesis
Terry James Bridges 1992 221 p
(ISBN-0-315-76447-3) Avail: Univ. Microfilms Order No. DANN76447

We have investigated the dependence of globular cluster system (GCS) properties on parent galaxy type and environment. We have acquired deep B and V CCD photometry of the GCS's of NGC 1399, the Fornax cluster cD, and NGC 4594, a large-bulged spiral. We find that the clusters in NGC 1399 and NGC 4594 are bluer (more metal-poor) than the halo light, and we show that there is a radial color gradient in the NGC 1399 GCS. We confirm that NGC 1399 has a superabundant GCS, whereas NGC 4594 has a cluster specific frequency similar to other Sa/Sb galaxies. We also find a central deficit of clusters in NGC 4594, but it is not clear whether this was built in or was due to subsequent dynamical evolution. We have also obtained deep V CCD photometry of two poor cluster cDs, NGC 4073 (MKW 4) and NGC 5629 (AWN 3). NGC 4073 has a detectable GCS, but it is unlikely to be as cluster-rich as some rich cluster cD/gE galaxies (e.g. M87, NGC 1399). No GCS has been detected around NGC 5629. Some GCS properties, namely the mean cluster color (metallicity) and the degree of central concentration, depend on parent galaxy luminosity, whereas the cluster specific frequency depends on galaxy environment and to a lesser extent on galaxy type. On the other hand, the existence of cluster central deficits and color gradients does not seem to depend on galaxy attributes or environment. The finding of color gradients in some GCSs and not in others implies that cluster formation is dissipative in some cases and more prolonged and chaotic in others. It is argued that the available data are most consistent with globular clusters forming during protogalactic collapse, but slightly before the halo field populations.

NUCLEAR PHYSICS AND ASTROPHYSICS
D. N. Schramm and A. V. Olinto Jun. 1993 11 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-FG02-91ER-40606)
(DE94-007168; DOE/ER-40606/3) Avail: Issuing Activity (Department of Energy (DOE))

The authors report on recent progress of research at the interface of nuclear physics and astrophysics. During the past year, the authors continued to work on Big Bang and stellar nucleosynthesis, the solar neutrino problem, the equation of state for dense matter, the quark-hadron phase transition, and the origin of gamma-ray bursts; and began studying the consequences of nuclear reaction rates in the presence of strong magnetic fields. They have shown that the primordial production of B and Be cannot explain recent detections of these elements in halo stars and have looked at spallation as the likely source of these elements. By looking at nucleosynthesis with inhomogeneous initial conditions, they concluded that the Universe must have been very smooth before nucleosynthesis. They have also constrained neutrino oscillations and primordial magnetic fields by Big Bang nucleosynthesis. On the solar neutrino problem, they have analyzed the implications of the SAGE and GALLEX experiments. They also showed that the presence of dibaryons in neutron stars depends weakly on uncertainties of nuclear equations of state. They have started to investigate the consequences of strong magnetic fields on nuclear reactions and implications for neutron star cooling and supernova nucleosynthesis. DOE

PATTERNS OF DEFORMATION AND VOLCANIC FLOWS ASSOCIATED WITH LITHOSPHERIC LOADING BY LARGE VOLCANOES ON VENUS Abstract Only **c46**
Patrick J. McGovern and Sean C. Solomon *In its* Tectonic History of the Terrestrial Planets Mar. 1993 1 p (For primary document see N94-31105 09-91)
Avail: CASI HC A01/MF A03

Magellan radar imaging and topography data are now available for a number of volcanoes on Venus greater than 100 km in radius. These data can be examined to reveal evidence of the flexural response of the lithosphere to the volcanic load. On Venus, erosion and sediment deposition are negligible, so tectonic evidence of deformation around large volcanoes should be evident except where buried by very young flows. Radar images reveal that most tectonic features and flow units on the flanks of these volcanoes have predominantly radial orientations. However, both Tepev Mons in Bell Regio and Sapas Mons in Atla Regio exhibit circumferential graben on their flanks. In addition, images reveal several flow units with an annular character around the north and west flanks of Tepev Mons. This pattern most likely results from ponding of flows in an annular flexural moat. Maat Mons in Atla Regio and Sif Mons in Eistla Regio are examples of volcanoes that lack circumferential graben and annular flows; discernible flow units and fractures on these constructs appear to be predominantly radial. Altimetry data can also provide evidence of flexural response. Tepev Mons is partially encircled by depressions that may be sections of a flexural moat that has not been completely filled. The locations of these depressions generally coincide with the annular flows described above. There is weaker evidence for such depressions around Maat Mons as

well. The lack of circumferential tectonic features around most volcanoes on Venus might be explained by gradual moat filling and coverage by radial flows. The depressions around Tepev (and possible Maat) may indicate that this process is currently continuing. We use analytic models of plate flexure in an axisymmetric geometry to constrain the elastic plate thickness supporting Tepev Mons. If we consider the outer radius of the ponded flows to be the edge of a moat, we find that models with elastic plate thickness of 10-20 km fit best. Finite element models of a volcanic load detached from the underlying lithosphere predict overthrusting and radial normal faulting at the volcano's edge. Such a mechanism for the formation of radial rift zones on Venus volcanoes would make such features analogous to structures on the flanks of volcanoes on Earth. Author (revised)

ASPECTS OF MODELLING THE TECTONICS OF LARGE VOLCANOES ON THE TERRESTRIAL PLANETS

Patrick J. McGovern and Sean C. Solomon *In its* Tectonic History of the Terrestrial Planets Mar. 1993 2 p (For primary document see N94-31105 09-91)

Avail: CASI HC A01/MF A03

Analytic solutions for the response of planetary lithospheres to volcanic loads have been used to model faulting and infer elastic plate thicknesses. Predictions of the distribution of faulting around volcanic loads, based on the application of Anderson's criteria for faulting to the results of the models, do not agree well with observations. Such models do not give the stress state and stress history within the edifice. The effects of episodic load growth can also be treated. When these effects are included, models give much better agreement with observations. Derived from text

STATE OF STRESS, FAULTING, AND ERUPTION CHARACTERISTICS OF LARGE VOLCANOES ON MARS

Patrick J. McGovern and Sean C. Solomon *In its* Tectonic History of the Terrestrial Planets Mar. 1993 89 p Submitted for publication (For primary document see N94-31105 09-91)

Avail: CASI HC A05/MF A03

The formation of a large volcano loads the underlying lithospheric plate and can lead to lithospheric flexure and faulting. In turn, lithospheric stresses affect the stress field beneath and within the volcanic edifice and can influence magma transport. Modeling the interaction of these processes is crucial to an understanding of the history of eruption characteristics and tectonic deformation of large volcanoes. We develop models of time-dependent stress and deformation of the Tharsis volcanoes on Mars. A finite element code is used that simulates viscoelastic flow in the mantle and elastic plate flexural behavior. We calculate stresses and displacements due to a volcano-shaped load emplaced on an elastic plate. Models variously incorporate growth of the volcanic load with time and a detachment between volcano and lithosphere. The models illustrate the manner in which time-dependent stresses induced by lithospheric plate flexure beneath the volcanic load may affect eruption histories, and the derived stress fields can be related to tectonic features on and surrounding martian volcanoes. ORIGIN AND THERMAL EVOLUTION OF MARS

G. Schubert, Sean C. Solomon, D. L. Turcotte, M. J. Drake, and N. H. Sleep *In* MIT, Tectonic History of the Terrestrial Planets Mar. 1993 19 p (For primary document see N94-31105 09-91)

Avail: CASI HC A03/MF A03

The thermal evolution of Mars is governed by subsolidus mantle convection beneath a thick lithosphere. Models of the interior evolution are developed by parameterizing mantle convective heat transport in terms of mantle viscosity, the superadiabatic temperature rise across the mantle and mantle heat production. Geological, geophysical, and geochemical observations of the composition and structure of the interior and of the timing of major events in Martian evolution, such as global differentiation, atmospheric outgassing and the formation of the hemispherical dichotomy and Tharsis, are used to constrain the model computations. Isotope systematics of SNC meteorites suggest core formation essentially contemporaneously with the completion of accretion. Other aspects of this investigation are discussed. Author (revised)

GEOID-TO-TOPOGRAPHY RATIOS ON VENUS: A GLOBAL PERSPECTIVE Abstract Only

Mark Simons and Sean C. Solomon *In its* Tectonic History of the Terrestrial Planets Mar. 1993 1 p (For primary document see N94-31105 09-91)

Avail: CASI HC A01/MF A03

Recently available spherical harmonic solutions for the geoid and topography of Venus are sufficiently high resolution that they can be used to address questions concerning the relationship between geoid and topography on a regional scale. We have approached this question by mapping the geoid-to-topography ratio (GTR) on a systematic global basis. For a given point on the surface, we consider the geoid and elevation values at all points on a gridded representation of those fields located within a specified distance of the reference point. From the set of paired values, we determine the correlation coefficient and the best-fitting straight line. The latter is the GTR at that position, and the former is a measure of the significance of the derived ratio. This procedure is then repeated for all points on the global grid, yielding maps of the GTR and the correlation coefficient. Unlike previous studies of the GRT on Venus, this apprach permits us to make an objective and systematic search for regions with anomalous GTR's as well as areas that do not demonstrate any strong correlation between geoid and topography. These maps can be updated regularly as new harmonic models of the Venus geoid are produced from new Magellan tracking data. This procedure permits the development of a global perspective on the relationship between GTR and venusian surface tectonics. Author (revised)

THE TECTONIC AND VOLCANIC EVOLUTION OF VENUS: CATASTROPHIC OR GRADUAL? Abstract Only

Sean C. Solomon *In* MIT, Tectonic History of the Terrestrial Planets Mar. 1993 1 p (For primary document see N94-31105 09-91)

Avail: CASI HC A01/MF A03

Radar imaging and altimetry data from the Magellan mission have yielded important new constraints on the tectonic and volcanic history of Venus and on its internal dynamics. The planet lacks global plate tectonics, but a number of chasm systems and corona moat structures have arcuate planforms, asymmetric topogrpahic profiles, and relief analogous to deep-sea trenches on Earth and may be products of limited lithospheric underthrusting or subduction. Several lines of evidence point to a crust and upper mantle stronger than would be predicted by simple extrapolation from Earth and the 450 K greater surface temperature; these include the unrelaxed depths of impact craters, apparently large values of elastic lithosphere thickness, and large ratios of gravity to topography. The density of impact craters indicates an averate crater retention age of about 500 My, but not more than 5% of the recognized craters have been volcanically embayed. This last observation has led to the proposal that Venus has been subjected to one or more global resurfacing events, the latest about 500 My ago, and that the volcanic flux during intervals between such events has been low. That more recent tectonic activity has been widespread, however, is indicated by the high relief and slopes of mountains, chasm walls, and plateau margins; the significant fraction (0.3) of impact craters deformed by younger faults; and the postformational vertical deformation of long channels. Interior dynamical scenarios advanced to account for episodic volcanic resurfacing include catastrophic overturn of a global lithosphere thickened by cooling or compositional buoyancy and strongly time-dependent mantle convective heat flux. Outgassing considerations and analogy with Earth and other terrestrial planets, however, suggests that such catastrophic models are unlikely. If the mantle of Venus cooled more efficiently than that of Earth because of, say, different boundary conditions, a different flow law, or a different degree of layering, then the planet may in the last 500 My have attained lesser mantle temperatures, lower mantle heat flux, and a significantly lesser rate of magma production than Earth yet still display evidence for ongoing convection and active tectonics. Such a 'cold Venus' scenario would be broadly consistent with observations yet be characterized by a gradual volcanic and tectonic evolution. Author (revised)

KEEPING THAT YOUTHFUL LOOK

Sean C. Solomon *In* MIT, Tectonic History of the Terrestrial Planets Mar. 1993 2 p Repr. from Nature, v. 361, 14 Jan. 1993 (For primary document see N94-31105 09-91)

Avail: CASI HC A01/MF A03

The record of impact cratering on Venus, recently revealed from high-resolution radar imaging by the Magellan spacecraft, has been interpreted as indicating that the planet underwent catastrophic global resurfacing about 500 million years ago. Although other interpretations of the crater characteristics have been suggested, the possibility of geologically rapid global resurfacing on the planet that most resembles our own in terms of mass, density, and bulk composition has generated widespread interest. The mechanisms that could cause such a catastrophe are discussed. Derived from text

A TECTONIC RESURFACING MODEL FOR VENUS

Sean C. Solomon *In* MIT, Tectonic History of the Terrestrial Planets Mar. 1993 2 p (For primary document see N94-31105 09-91)

Avail: CASI HC A01/MF A03

Two remarkable aspects of the population of impact craters on Venus are that craters at all sizes are indistinguishable from a random population and that the vast majority of craters have not been significantly modified by tectonic strain or by volcanic flows external to the crater rim, despite evidence from Magellan images that volcanic and tectonic features are widespread on Venus. One interpretation of these observations is that most of the surface dates from the end of a catastrophic global resurfacing event that ceased about 500 My ago, and that the small fraction of craters volcanically embayed or modified by deformation indicates that volcanic and tectonic activity subsequent to that time has been at much lower levels. An alternative model, in which resurfacing occurs episodically in patches a few hundred kilometers in extent and there is a wider spectrum of surface ages, also appears to be consistent with the characteristics of impact craters on Venus. A number of potential mechanisms for catastrophic resurfacing of Venus have been proposed, ranging from geologically sudden convective destabilization of the global lithosphere to strongly time-dependent heat flux and melt generation in the underlying mantle. In most of these geophysical models, resurfacing occurs implicitly or explicitly by volcanism. We explore the hypothesis that, at least in the geologically recent history of Venus, the primary resurfacing mechanism has been tectonic deformation rather than volcanism. We show how such a hypothesis provides at least as good an explanation of a wide range of observations as do volcanic resurfacing models. Finally, we explore the implications of tectonic resurfacing hypothesis for the controversy over the recent resurfacing history of the planet. Derived from text

THE RESURFACING CONTROVERSY FOR VENUS: AN OVERVIEW AND A MECHANISTIC PERSPECTIVE Abstract Only

Sean C. Solomon *In* MIT,. Tectonic History of the Terrestrial Planets Mar. 1993 1 p (For primary document see N94-31105 09-91)

Avail: CASI HC A01/MF A03

Two remarkable aspects of the population of impact craters on Venus are that craters at all sizes are indistinguishable from a random population and that most craters have not been significantly modified by tectonic strain or by volcanic flows external to the crater rim, despite evidence from Magellan images that volcanic and tectonic features are widespread on Venus. One interpretation of these observations is that most of the surface dates from the end of a catastrophic global resurfacing event that ceased about 500 My ago, and that a small fraction of craters volcanicly embayed or modified by deformation indicate that volcanic and tectonic activity subsequent to that time has been at much lower levels. A competing scenario, in which resurfacing occurs episodically in patches a few hundred kilometers in extent and there is a wider spectrum of surface ages, also appears to be consistent with the characteristics of impact craters on Venus. While geological and statistical studies of the crater population on Venus offer some promise for distinguishing between these two hypotheses, consideration of the possible mechanisms of catastrophic episodic resurfacing provides an independent perspective. Potential mechanisms for catastrophic resurfacing of Venus range from geologically sudden convective destabilization of the global lithosphere to strongly time-dependent heat flux and melt generation in the underlying mantle. For most of these mechanisms, resurfacing occurs implicitly or explicitly by volcanism. An alternative hypothesis is that, at least in the geologically recent history of Venus, the primary resurfacing mechanism has been tectonic deformation rather than volcanism. Because the rate of surface strain should be controlled by the temperature-dependent strength of the lower crust, a geologically rapid transition in surface strain rates should be the natural result of planetary cooling. This transition would occur at comparable times for areas of similar crustal thickness and heat flow, but would be delayed for regions of thicker or hotter crust. The end of the era of high rates of tectonic resurfacing could thus appear as a 'catastrophe' over the 80% of the planet with an elevation within 1 Km of the mean, while continued deformation would give rise to 'episodic' resurfacing to much younger times in the highlands, a result consistent with lower crater densities seen in highland regions. Author (revised)

PLAINS TECTONISM ON VENUS: THE DEFORMATION BELTS OF LAVINIA PLANITIA

Steven W. Squyres, David G. Jankowski, Mark Simons, Sean C. Solomon, Bradford H. Hager, and George E. McGill *In* MIT, Tectonic History of the Terrestrial Planets Mar. 1993 21 p Repr. from Journal of Geophysical Research, v. 97, no. E8, 25 Aug. 1992 p 13, 579-13, 599 See also A92-52671 (For primary document see N94-31105 09-91)

Avail: CASI HC A03/MF A03

High-resolution radar images from the Magellan spacecraft have revealed the first details of the morphology of the Lavinia Planitia region of Venus. A number of geologic units can be distinguished, including volcanic plains units with a range of ages. Transecting these plains over much of the Lavinia region are two types of generally orthogonal features that we interpret to be compressional wrinkle ridges and extensional grooves. The dominant tectonic features of Lavinia are broad elevated belts of intense deformation that transect the plains with complex geometry. They are many tens to a few hundred kilometers wide, as much as 1000 km long, and elevated hundreds of meters above the surrounding plains. Two classes of deformation belts are seen in the Lavinia region. 'Ridge belts' are composed of parallel ridges, each a few hundred meters in elevation, that we interpret to be folds. Typical fold spacings are 5-10 km. 'Fracture belts' are dominated instead by intense faulting, with faults in some instances paired to form narrow grabens. There is also some evidence for modest amounts of horizontal shear distributed across both ridge and fracture belts. Crosscutting relationships among the belts show there to be a range in belt ages. In western Lavinia, in particular, many ridge and fracture belts appear to bear a relationship to the much smaller wrinkle ridges and grooves on the surrounding plains: ridge morphology tends to dominate belts that lie more nearly parallel to local plains wrinkle ridges, and fracture morphology tends to dominate belts that lie more nearly parallel to local plains grooves. We use simple models to explore the formation of ridge and fracture belts. We show that convective motions in the mantle can couple to the crust to cause horizontal stresses of a magnitude sufficient to induce the formation of deformation belts like those observed in Lavinia. We also use the small-scale wavelengths of deformation observed within individual ridge belts to place an approximate lower limit on the venusian thermal gradient in the Lavinia region at the time of deformation.

FIBER OPTIC CHEMICAL SENSORS ON MARS

M. A. Butler, A. J. Ricco, F. J. Grunthaner, and A. L. Lane 1993 10 p Presented at the Space 1994 International Conference and Exposition on Engineering, Construction, and Operations in Space, Albuquerque, NM, 26 Feb. - 3 Mar. 1994

(Contract DE-AC04-94AL-85000)

(DE94-005251; SAND-93-1601C; CONF-940214-6) Avail: CASI HC A02/MF A01

A fiber optic chemical sensing instrument is described that will measure the reactivity of the martian soil and atmosphere. The self-contained instrument monitors reflectivity changes in reactive thin films caused by

chemical reactions with the martian soil or atmosphere. Data from over 200 separate thin-film-coated optical fibers are recorded simultaneously. This fiber optic sensing technology has many advantages for planetary exploration and monitoring applications on manned spacecraft, in addition to many practical terrestrial uses. DOE

MARS: FIVE VIEWS ON WHAT IS KNOWN (Videotape)
Feb. 1993 Videotape: 29 min. playing time, in color, with sound
(NASA-TM-109751; NONP-VT-94-9951) Avail: CASI VHS A01/BETA A22

This video gives a historical survey of philosophy and scientific study of the nature of the surface of Mars and discussion of whether life existed or exists on Mars. Several Lewis researchers recount early telescope observations of Mars including the identification of 'channels' or possible ancient waterways on the surface. An overview of the accomplishments of the Mariner spacecraft in mapping the surface of Mars as well as a detailed description of the Viking missions to Mars are presented. The results of the Viking Biology Experiment, conducted by the Viking Lander, are highlighted. There is also a discussion of the possible presence of monuments and a huge 'face' on the Martian surface. The video includes several computer simulations of flight over the Martian surface. CASI

ONE: MICROPHYSICS OF FROST METAMORPHISM: APPLICATIONS TO TRITON AND MARS. TWO: A GLOBAL ANALYSIS OF THE OZONE DEFICIT IN THE UPPER STRATOSPHERE AND LOWER MESOSPHERE. THREE: THE DIABATIC CIRCULATION IN THE STRATOSPHERE AS DIAGNOSED FROM MICROWAVE LIMB SOUNDER DATA Ph.D. Thesis
Janusz Bronistaw Eluszkiewicz 1993 130 p
Avail: Univ. Microfilms Order No. DA9316839

The present thesis is devoted to two broad subjects, planetary frost metamorphism and the terrestrial middle atmosphere, and consists of three papers. Paper 1 considers frost metamorphism on the surfaces of Triton and Mars. Based on an analysis of the microphysical processes involved in the pressureless sintering, it is concluded that fine-grained nitrogen and carbon dioxide frosts can undergo seasonal metamorphism into semitransparent layers on the surface of Triton and in the Martian seasonal polar caps, respectively. The presence of such layers explains a host of facts about Triton's surface and about the Martian seasonal caps. Paper 2 is devoted to elucidating a long-standing issue in the terrestrial middle atmosphere chemistry, the so-called 'ozone deficit problem.' Based on an analysis of data acquired by the Limb Infrared Monitor of the Stratosphere (LIMS) instrument between October 1978 and May 1979, it is concluded that current photochemical models systematically underestimate observed ozone abundances in the upper stratosphere and lower mesosphere. Three modifications to the accepted photochemical scheme, capable of providing a global solution to this problem, are proposed and discussed. Paper 3 differs from the other two in that it reports on results from an ongoing research effort. It considers the diabatic circulation in the stratosphere and lower mesosphere, using ozone and temperature measurements acquired by the Microwave Limb Sounder (MLS) instrument onboard the Upper Atmosphere Research Satellite (UARS). The present study extends past analyses of the diabatic circulation by considering a full annual cycle, November 1991-November 1992, and by taking advantage of the high vertical resolution of MLS data. In the tropical upper stratosphere and lower mesosphere, a semiannual oscillation (SAO) is observed in the computed circulation, with the region of downwelling reaching maximum spatial extent approximately 1 month before the equinox. The projected lifetime of UARS should enable the present analysis to be extended to several SAO cycles. Dissert. Abstr.

A STUDY OF AREAS OF LOW RADIO-THERMAL EMISSIVITY ON VENUS Ph.D. Thesis
Robert Joseph Wilt 1992
Avail: Issuing Activity (MIT Libraries, Rm. 14-0551, Cambridge, MA 02139-4307)

Observations performed by the Magellan radiometer experiment have confirmed previous findings that a few regions on Venus, primarily at higher elevations, possess unexpectedly low values of radiothermal emissivity, occasionally reaching as low as 0.3. Values of emissivity below 0.7 occur over about 1.5 percent of the surface, and are associated with several types of features, including highlands, volcanoes, tectonically uplifted terrain, and impact craters. There is a strong correlation of low emissivity and high elevation, but rather than decreasing gradually with elevation, the emissivity drops rapidly in a small altitude range above a certain 'critical radius'. The altitude at which the change in emissive properties occurs varies from feature to feature; on average, it lies at a planetary radius of about 6054 km. Notable exceptions to the association of low emissivity and high elevation exist; for example, Lakshmi Planum, Maat Mons, and the summits of many volcanoes display high emissivities at high elevations, while in some impact craters and plains areas we find low emissivities at low elevations. Two possible explanations for low emissivities have been advanced: (1) emission from a highly reflective single interface between the atmosphere and a surface material having a bulk dielectric constant of order 80 ('high-dielectric' model); and (2) emission from the surface of a low-loss soil having a more usual permittivity (of order 2) which contains subsurface scatterers composed of ordinary rock materials ('volume scattering' model). Theoretical results and Monte Carlo simulations are used to show that the previously proposed volume scattering model cannot account for the observed emissivities; however, scattering from a material with very low loss (loss factor of order 10(exp -3) or less) containing subsurface voids could produce the observed results. Consideration of the two models in light of the Magellan observations leads us to believe that the low emissivities on Venus result from the creation of a high-dielectic material by surface-atmosphere interaction, probably a loaded dielectric containing a conductive mineral. Dissert. Abstr.

PLANETARY MAGNETOTAILS: MAGNETIC CONFIGURATION AND NONTHERMAL PLASMA Ph.D. Thesis
Carl Max Hammond, Jr. 1993 235 p
Avail: Univ. Microfilms Order No. DA9321918

This dissertation examines three aspects of planetary magnetotails: time averaged structure, interplanetary magnetic field (IMF) induced changes in structure, and relationship of the magnetic structure to the nonthermal plasma component. In chapter 2, we present images of the time averaged shape terrestrial magnetotail. Using these images, we model the neutral sheet and magnetopause and apply these models to the uranian magnetotail. Having presented models of the time averaged shape of planetary magnetotails in chapter 2, we use the same imaging technique, in chapter 5, to examine the effect of the IMF on the structure of the tail. During periods of southward IMF, we find changes in the tail consistent with substorm growth phase. We find the neutral sheet rotates in response to the B(sub y) component of the IMF. We then examine the tail plasma. We show an anomalous encounter with the uranian plasma sheet observed by the Voyager 2 spacecraft is consistent with an expanded plasma sheet resulting from an injection of plasma below 28 keV. We then utilize the results from large scale kinetic simulations to show that the amount of tail 'stretch' can affect the high energy particle distribution. Finally, we examine the stability of the kappa distribution to non-resonant interactions using a Monte Carlo algorithm. Dissert. Abstr.

BIOSPHERIC EFFECTS OF A LARGE EXTRATERRESTRIAL IMPACT: CASE STUDY OF THE CRETACEOUS/TERTIARY BOUNDARY CRATER Progress Report, FY 1993
Kevin O. Pope 10 May 1994 21 p
(Contract NASw-4812)
(NASA-CR-195827; NAS 1.26:195827) Avail: CASI HC A03/MF A01

The Chicxulub Crater in Yucatan, Mexico, is the primary candidate for the impact that caused mass extinctions at the Cretaceous/Tertiary boundary. The target rocks at Chicxulub contain 750 to 1500 m of anhydrite (CaSO4), which was vaporized upon impact, creating a large sulfuric acid aerosol cloud. In this study we apply a hydrocode model of asteroid impact to calculate the amount of sulfuric acid produced. We then apply a radiative transfer model to determine the atmospheric effects. Results include 6 to 9 month period of darkness followed by 12 to 26 years of cooling.

THE LUNAR SCOUT PROGRAM: AN INTERNATIONAL PROGRAM TO SURVEY THE MOON FROM ORBIT FOR GEOCHEMISTRY, MINERALOGY, IMAGERY, GEODESY, AND GRAVITY Report, 1991 - 1993

Donald A. Morrison, ed. Apr. 1994 147 p

(NASA-TM-104791; S-762; NAS 1.15:104791) Avail: CASI HC A07/MF A02

The Lunar Scout Program was one of a series of attempts by NASA to develop and fly an orbiting mission to the moon to collect geochemical, geological, and gravity data. Predecessors included the Lunar Observer, the Lunar Geochemical Orbiter, and the Lunar Polar Orbiter - missions studied under the auspices of the Office of Space Science. The Lunar Scout Program, however, was an initiative of the Office of Exploration. It was begun in late 1991 and was transferred to the Office of Space Science after the Office of Exploration was disbanded in 1993. Most of the work was done by a small group of civil servants at the Johnson Space Center; other groups also responsible for mission planning included personnel from the Charles Stark Draper Laboratories, the Lawrence Livermore National Laboratory, Boeing, and Martin Marietta. The Lunar Scout Program failed to achieve new start funding in FY 93 and FY 94 as a result of budget downturns, the de-emphasis of the Space Exploration Initiative, and the fact that lunar science did not rate as high a priority as other planned planetary missions, and was cancelled. The work done on the Lunar Scout Program and other lunar orbiter studies, however, represents assets that will be useful in developing new approaches to lunar orbit science. Derived from text

This report summarizes results obtained through the support of NASA Grant NAGW-2412. The objective of this project is to conduct a comprehensive investigation of the radio wave emission observed by the planetary radio astronomy (PRA) instrument on board Voyager 2 as if flew by Neptune. This study has included data analysis, theoretical and numerical calculations, ray tracing, and modeling to determine the possible source mechanism(s) and locations of the Neptune radio emissions. We have completed four papers, which are included in the appendix. The paper 'Modeling of Whistler Ray Paths in the Magnetosphere of Neptune' investigated the propagation and dispersion of lighting-generated whistler in the magnetosphere of Neptune by using three dimensional ray tracing. The two papers 'Numerical Simulations of Bursty Radio Emissions from Planetary Magnetospheres' and 'Numerical Simulations of Bursty Planetary Radio Emissions' employed numerical simulations to investigate an alternate source mechanism of bursty radio emissions in addition to the cyclotron maser instability. We have also studied the possible generation of Z and whistler mode waves by the temperature anisotropic beam instability and the result was published in 'Electron Cyclotron Wave Generation by Relativistic Electrons.' Besides the aforementioned studies, we have also collaborated with members of the PRA team to investigate various aspects of the radio wave data. Two papers have been submitted for publication and the abstracts of these papers are also listed in the appendix. Derived from text

DISTRIBUTION AND NATURE OF UV ABSORBERS ON TRITON'S SURFACE Annual Report

S. Alan Stern 1 Mar. 1994 47 p

(Grant NAGw-3402; SwRI Proj. 15-5653)

(NASA-CR-195886; NAS 1.26:195886) Avail: CASI HC A03/MF A01

Substantial evidence suggests that a UV Spectrally Absorbing Material (UV-SAM) exists on Triton's surface. This evidence is found in the positive slope in Triton's spectrum from the UV to the near-IR, and the increasing contrast in Triton's light curve in the blue and UV. Although it is now widely-thought that UV-SAM's exist on Triton, little is known about their distribution and spectral properties. The goal of this NDAP Project is to determine the spatial distribution and geological context of the UV-SAM material. We hope to determine if UV-SAM's on Triton are correlated with geologic wind streaks, craters, calderas, geomorphic/topographic units, regions containing (or lacking) volatile frosts, or some other process (e.g., magnetospheric interactions). Once the location and distribution of UV-SAM's has been determined, further constraints on their composition can be made by analyzing the spectrographic data set. To accomplish these goals, various data sets will be used, including Voyager 2 UV and visible images of Triton's surface, IUE and HST spectra of Triton, and a geologic map of the surface based on Voyager 2 and spectrophotometric data. The results of this research will be published in the planetary science literature. Derived from text

DEPTH-DIAMETER RATIOS FOR MARTIAN IMPACT CRATERS: IMPLICATIONS FOR TARGET PROPERTIES AND EPISODES OF DEGRADATION Abstract Only

N. G. Barlow *In its* Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 1 (For primary document see N94-33190 09-91)

Avail: CASI HC A01/MF A01

This study determines crater depth through use of photoclinometric profiles. Random checks of the photoclinometric results are performed using shadow estimation techniques. The images are Viking Orbiter digital format frames; in cases where the digital image is unusable for photoclinometric analysis, shadow estimation is used to determine crater depths. The two techniques provide depth results within 2 percent of each other. Crater diameters are obtained from the photoclinometric profiles and checked against the diameters measured from the hard-copy images using a digitizer. All images used in this analysis are of approximately 40 m/pixel resolution. The sites that have been analyzed to date include areas within Arabia, Maja Valles, Memnonia, Acidalia, and Elysium. Only results for simple craters (craters less than 5 km in diameter) are discussed here because of the low numbers of complex craters presently measured in the analysis. General results indicate that impact craters are deeper than average. A single d/D relationship for fresh impact craters on Mars does not exist due to changes in target properties across the planet's surface. Within regions where target properties are approximately constant, however, d/D ratios for fresh craters can be determined. In these regions, the d/D ratios of nonpristine craters can be compared with the fresh crater d/D relationship to obtain information on relative degrees of crater degradation. This technique reveals that regional episodes of enhanced degradation have occurred. However, the lack of statistically reliable size-frequency distribution data prevents comparison of the relative ages of these events

between different regions, and thus determination of a large-scale episode (or perhaps several episodes) cannot be made at this time.

STATIONARY EDDIES IN THE MARS GENERAL CIRCULATION AS SIMULATED BY THE NASA-AMES GCM Abstract Only

J. R. Barnes (Oregon State Univ., Corvallis.), J. B. Pollack, and Robert M. Haberle *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 2 (For primary document see N94-33190 09-91)

Avail: CASI HC A01/MF A01

Quasistationary eddies are prominent in a large set of simulations of the Mars general circulation performed with the NASA-Ames GCM. Various spacecraft observations have at least hinted at the existence of such eddies in the Mars atmosphere. The GCM stationary eddies appear to be forced primarily by the large Mars topography, and (to a much lesser degree) by spatial variations in the surface albedo and thermal inertia. The stationary eddy circulations exhibit largest amplitudes at high altitudes (above 30-40 km) in the winter extratropical regions. In these regions they are of planetary scale, characterized largely by zonal wavenumbers 1 and 2. Southern Hemisphere winter appears to be dominated by a very strong wave 1 pattern, with both waves 1 and 2 being prominent in the Northern Hemisphere winter regime. This difference seems to be basically understandable in terms of differences in the topography in the two hemispheres. The stationary eddies in the northern winter extratropics are found to increase in amplitude with dust loading. This behavior appears to be at least partly associated with changes in the structure of the zonal-mean flow that favor a greater response to wave 1 topographic forcing. There are also strong stationary eddy circulations in the tropics and in the summer hemisphere. The eddies in the summer subtropics and extratropics are substantially stronger in southern summer than in northern summer. The summer hemisphere stationary circulations are relatively shallow and are characterized by smaller zonal scales than those in the winter extratropics.

THERMAL EMISSION MEASUREMENTS (5-25 MICRONS) OF HAWAIIAN PALAGONITIC SOILS WITH IMPLICATIONS FOR MARS Abstract Only

J. F. Bell, III and T. L. Roush *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 2-3 (For primary document see N94-33190 09-91)

Avail: CASI HC A01/MF A01

The research presented here represents the initial phase of a broader project that is intended to provide data in the mid- and far-IR spectral region for both well-characterized iron oxides/oxyhydroxides and poorly crystalline or amorphous materials (e.g., palagonites). Such information can be used in the interpretation of data to be returned by the Mars Observer Thermal Emission Spectrometer (TES). Additionally, this same information will prove useful for assessing the information content of existing Kuiper Airborne Observatory, Mariner 7, and Mariner 9 spectra. which also cover the thermal IR wavelength region.

THERMAL STUDIES OF MARTIAN CHANNELS AND VALLEYS USING TERMOSKAN DATA: NEW RESULTS Abstract Only

B. H. Betts and B. C. Murray *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 3-4 (For primary document see N94-33190 09-91)

Avail: CASI HC A01/MF A01

The Termoskan instrument onboard the Phobos '88 spacecraft acquired the highest-spatial-resolution thermal data ever obtained for Mars. Included in the thermal images are 2 km/pixel midday observations of several major channel and valley systems, including significant portions of Shalbatana Vallis, Ravi Vallis, Al-Qahira Vallis, Ma'adim Vallis, the channel connecting Valles Marineris with Hydraotes Chaos, and channel material in Eos Chasma. Termoskan also observed small portions of the southern beginnings of Simud, Tiu, and Ares Valles and some channel material in Gangis Chasma. Simultaneous broad band visible data were obtained for all but Ma'adim Vallis. We find that most of the channels and valleys have higher inertias than their surroundings, consistent with Viking IRTM-based thermal studies of Martian channels. We see for the first time that thermal inertia boundaries closely match all flat channel floor boundaries. Combining Termoskan thermal data, relative observations from Termoskan visible channel data, Viking absolute bolometric albedos, and a thermal model of the Mars surface, we have derived lower bounds on channel thermal inertias. Lower bounds on typical channel thermal inertias range from 8.4 to 12.5 (10(exp -3) cal cm(exp -2) s(exp -1/2)K(exp -1)) (352 to 523 in SI units). Lower bounds on inertia differences with the surrounding heavily cratered plains range from 1.1 to 3.5 (46 to 147 in SI units). Atmospheric and geometric effects are not sufficient to cause the inertia enhancements. We agree with previous researchers that localized, dark, high inertia areas within channels are likely eolian in nature. However, the Temloskan data show that eolian deposits do not fill the channels, nor are they responsible for the overall thermal inertia enhancement. Thermal homogeneity and strong correlation of thermal boundaries with the channel floor boundaries lead us to favor noneolian overall explanations.

THE IMPORTANCE OF ENVIRONMENTAL CONDITIONS IN REFLECTANCE SPECTROSCOPY OF LABORATORY ANALOGS FOR MARS SURFACE MATERIALS Abstract Only

J. Bishop, S. Murchie, S. Pratt, J. Mustard, and C. Pieters *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 4-6 Sponsored by Keck Foundation (For primary document see N94-33190 09-91)

(Grants NAGw-28; NAGw-748)

Avail: CASI HC A01/MF A01

Reflectance spectra are presented here for a variety of particulate, ferric-containing analogs to Martian soil (Fe(3+)-doped smectites and palagonites) to facilitate interpretation of remotely acquired spectra. The analog spectra were measured under differing environmental conditions to evaluate the influence of exposure history on water content and absorption features due to H2O in these samples. Each of these materials contains structural OH bonded to metal cations, adsorbed H2O, and bound H2O (either in a glass, structural site, or bound to a cation). Previous experiments involving a variety of Mars analogs have shown that the 3 micron H2O band in spectra of palagonites is more resistant to drying than the 3 micron H2O band in spectra of montmorillonites. Other experiments have shown that spectra of ferrihydrite and montmorillonites doped with ferric sulfate also contain sufficient bound H2O to retain a strong 3 micron band under dry conditions. Once the effects of the environment on bound water in clays, oxides, and salts are better understood, the hydration bands measured via reflectance spectroscopy can be used to gain information about the chemical composition and moisture content of real soil systems. Such information would be especially useful in interpreting observations of Mars where subtle spatial variations in the strengths of metal-OH and H2O absorptions have been observed in telescopic and ISM spectra. We measured bidirectional reflectance spectra of several Mars soil analogs under controlled environmental conditions to assess the effects of moisture content on the metal-OH and H2O absorptions. The samples analyzed include chemically altered montmorillonites, ferrihydrite. and palagonites from Hawaii and Iceland. Procedures for preparation of the cation-exchanged montmorillonites, ferric-salt doped montmorillonites, and ferric oxyhydroxides are described in detail elsewhere.

FERRIC SULFATE MONTMORILLONITES AS MARS SOIL ANALOGS Abstract Only

J. L. Bishop, C. M. Pieters, and R. G. Burns *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 6-8 Sponsored by Keck Foundation (For primary document see N94-33190 09-91)

(Grants NAGw-28; NAGw-2220; NAGw-748)

Avail: CASI HC A01/MF A01

Spectroscopic analyses have shown that Fe(3+)-doped smectites prepared in the laboratory exhibit important similarities to the soils on Mars. Ferrihydrite in these smectites has features in the visible to near-infrared region that resemble the energies and band-strengths of features in reflectance spectra observed for several bright regions on Mars. Ferric - sulfate - montmorillonite samples have been prepared more recently because they are a good compositional match with the surface material

on Mars as measured by Viking. Reflectance spectra of montmorillonite doped with ferric sulfate in the interlayer regions include a strong 3 micron band that persists under dry conditions. This is in contrast to spectra of similarly prepared ferric-doped montmorillonites, which exhibit a relatively weaker 3 micron band under comparable dry environmental conditions. Presented here are reflectance spectra of a suite of ferric-sulfate exchanged montmorillonites prepared with variable ferric sulfate concentrations and variable pH conditions. Derived from text

CONSTRAINTS ON THE MARTIAN CRATERING RATE IMPOSED BY THE SNC METEORITES AND VALLIS MARINERIS LAYERED DEPOSITS Abstract Only
J. E. Brandenburg *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 8-10 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

Following two independent lines of evidence -- estimates of the age and formation time of a portion of the Martian geologic column exposed in the layered deposits and the crystallization and ejection ages of the SNC meteorites -- it appears that the Martian cratering rate must be double the lunar rate or even higher. This means models such as NHII or NHIII (Neukum and Hiller models II and III), which estimate the Martian cratering rate as being several times lunar are probably far closer to reality on Mars than lunar rates. The effect of such a shift is profound: Mars is transformed from a rather Moon-like place into a planet with vigorous dynamics, multiple large impacts, erosion, floods, and volcanism throughout its history. A strong shift upward in cratering rates on Mars apparently solves some glaring problems; however, it creates others. The period of time during which Earth-like atmospheric conditions existed, the liquid water era on Mars, persists in NHIII up to only 0.5 b.y. ago. Scenarios of extended Earth-like conditions on Mars have been discounted in the past because they would have removed many of the craters from the early bombardment era found in the south. It does appear that some process of crater removal was quite vigorous in the north during Mars' past. Evidence exists that the northern plains may have been the home of long-lived seas or perhaps even a paleo-ocean, so models exist for highly localized destruction of craters in the north. However, the question of how the ancient crater population could be preserved in the south under a long liquid-water era found in any high-cratering-rate models is a serious question that must be addressed. It does appear to be a higher-order problem because it involves low-energy dynamics acting in localized areas, i.e., erosion of craters in the south of Mars, whereas the two problems with the low-cratering-rate models involve high-energy events acting over large areas: the formation of the Vallis Marineris, the SNC ejecting impacts, and the global atmospheric pressure and temperature conditions that allow liquid water to exist as a robust entity anywhere on the Martian surface. In any case, it appears Mars is a more complex and dynamic planet than previously supposed. It has canyons dating from the middle to late period of its history that contain apparent lake sediments bedded deeper than most sediments on Earth. Recent multiple, violent impacts on Mars have apparently provided us with multiple random samples of its surface that all crystallized less than 1.5 b.y. ago. These things cannot be accommodated in our present cratering chronologies of Mars, based on 1x lunar cratering rates, without great difficulties. These difficulties suggest that a new chronology, probably based on NHII or even NHIII, should be adopted; this new chronology will provide us with a new view of Mars as a dynamic planet of rich history. DEPOSITION RATES OF OXIDIZED IRON ON MARS Abstract Only
R. G. Burns *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 10-12 (For primary document see N94-33190 09-91)
(Grant NAGw-2220)
Avail: CASI HC A01/MF A01

The reddened oxidized surface of Mars is indicative of temporal interactions between the Martian atmosphere and its surface. During the evolution of the Martian regolith, primary ferromagnesian silicate and sulfide minerals in basaltic rocks apparently have been oxidized to secondary ferric-bearing assemblages. To evaluate how and when such oxidized deposits were formed on Mars, information about the mechanisms and rates of chemical weathering of Fe(2+)-bearing minerals has been determined. In this paper, mechanisms and rates of deposition of ferric oxide phases on the Martian surface are discussed. Author

MARSNET: A EUROPEAN NETWORK OF STATIONS ON THE SURFACE OF MARS Abstract Only
A. F. Chicarro *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 12-14 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

Following an ESA preliminary study on the possible areas of European participation in the future international exploration of Mars and an ESA call for ideas of new missions, MARSNET, a network of small surface stations, was selected for further in-depth scientific and technical assessment studies as a potential European contribution to such exploration. Subsequently, the MARSNET phase A studies started in the autumn of 1991. The industrial kickoff took place in early January 1992, following the tender evaluation and the decision to select the Aerospatiale-led consortium including Dornier, Alcatel, Laben, and Etca to perform the industrial studies. The phase A studies ended in early 1993. However, critical items such as an instrument deployment device continue to be studied in the framework of ESA's Technology Research Program. The MARSNET mission consists of a network of three semihard landers to be placed on the Martian surface, several thousand kilometers apart, thus defining a regional/global seismological and meteorological network in the Tharsis region. The small stations would be targeted for landing at scientifically interesting sites in this region of Mars, which is the most likely area to still show tectonic activity; this would allow the seismometers to acquire data for the determination of the internal structure of the planet. Landing site geology and geochemistry will also be studied. Derived from text

MARS ATMOSPHERIC DUST PROPERTIES: A SYNTHESIS OF MARINER 9, VIKING, AND PHOBOS OBSERVATIONS Abstract Only
R. T. Clancy, S. W. Lee, and G. R. Gladstone *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 14-15 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

We have modified a doubling-and-adding code to reanalyze the Mariner 9 IRIS spectra of Mars atmospheric dust as well as Viking IRTM EPF sequences in the 7, 9, and 20 micron channels. The code is capable of accurate emission/ absorption/scattering radiative transfer calculations over the 5-30 micron wavelength region for variable dust composition and particle size inputs, and incorporates both the Viking IRTM channel weightings and the Mariner 9 IRIS wavelength resolution for direct comparisons to these datasets. We adopt atmospheric temperature profiles according to the algorithm of Martin (1986) in the case of the Viking IRTM comparisons, and obtained Mariner 9 IRIS temperature retrievals from the 15 micron CO2 band for the case of the IRIS comparisons. We consider palagonite as the primary alternative to the montmorillonite composition of Mars atmospheric dust, based on several considerations. Palagonite absorbs in the ultraviolet and visible wavelength region due to its Fe content. Palagonite is also, in principal, consistent with the observed lack of clays on the Mars surface. Furthermore, palagonite does not display strong, structured absorption near 20 microns as does montmorillonite (in conflict with the IRIS observations). We propose that a palagonite composition with particle sizes roughly one-half that of the Toon et al. (1977) determination provide a much improved model to Mars atmospheric dust. Since palagonite is a common weathering product of terrrestrial basalts, it would not be unreasonable for palagonite to be a major surface component for Mars. The lack of even a minor component of Al-rich clays on the surface of Mars could be consistent with a palagonite composition for Mars dust if the conditions for basalt weathering on Mars were sufficiently anhydrous. Variations in palagonite composition could also lead to the inability of the modeled palagonite to fit the details of the 9 micron absorbtion indicated by the IRIS observations. Derived from text

MAGMATIC VOLATILES AND THE WEATHERING OF MARS Abstract Only

B. C. Clark *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 15-16 (For primary document see N94-33190 09-91)

Avail: CASI HC A01/MF A01

The sources for volatiles on Mars have been the subject of many hypotheses for exogenous influences including late accretion of volatile-enriched material, impact devolatilization to create massive early atmospheres, and even major bombardment by comets. However, the inventory of chemically active volatiles observable at the contemporary surface of Mars is consistent with domination by endogenous, subsequent planetary processes, viz., persistent magmatic outgassing. Volcanism on Mars has been widespread in both space and time. Notwithstanding important specific differences between the mantles of Earth and Mars, the geochemical similarities are such that the suite of gases emitted from Martian volcanic activity should include H2O, CO2, S-containing gases (e.g. H2S and/or SO2), and Cl-containing gases (e.g., Cl2 and/or HCl). H2O and CO2 exist in the atmosphere of Mars. Both are also present as surface condensates. However, spectroscopic observations of the Martian atmosphere clearly show that the S- and Cl-containing gases are severely depleted, with upper limits of less than or equal to 10(exp -7) the abundance of CO2. Likewise, there is no evidence of polar condensates of compounds of these elements as there is for CO2 and H2O. Within the soil, on the other hand, there has been direct measurement of incorporated H2O and abundant compounds containing S and Cl. Barring some as yet implausible geochemical sequestering process, the S/Cl ratio of about 6:1 in Martian soils implies a limit of 5% on the contribution of matter of solarlike composition (e.g., carbonaceous chondrite or cometary material) to these volatiles. Hence, exogenous sources are minor or not yet observed. From analysis of elemental trends in Martian soils, it has been recently shown that a simple two-component model can satisfy the Viking in situ measurements. Component A includes Si and most or all the Al, Ca, Ti, and Fe. Component B, taken as 16 +/- 3% by weight of the total, contains S and most or all the Cl and Mg. These results constrain several models of Martian soil mineralogy but are consistent with a mixture of silicates (such as Fe-rich clays and accessory minerals and soluble salts). The overall element profile is notably like shergottites, with significant incorporation of chemically reactive atmospheric gases from magmatic degassing. Derived from text

THERMAL AND HYDRAULIC CONSIDERATIONS REGARDING THE FATE OF WATER DISCHARGED BY THE OUTFLOW CHANNELS TO THE MARTIAN NORTHERN PLAINS Abstract Only

S. M. Clifford *In its* Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 16-17 (For primary document see N94-33190 09-91)

Avail: CASI HC A01/MF A01

The identification of possible shorelines in the Martian northern plains suggests that the water discharged by the circum-Chryse outflow channels may have led to the formation of transient seas, or possibly even an ocean, covering as much as one-third of the planet. Speculations regarding the possible fate of this water have included local ponding and reinfiltration into the crust; freezing, sublimation, and eventual cold-trapping at higher latitudes; or the in situ survival of this now frozen water to the present day -- perhaps aided by burial beneath a protective cover of eolian sediment or lavas. Although neither cold-trapping at higher latitudes nor the subsequent freezing and burial of flood waters can be ruled out, thermal and hydraulic considerations effectively eliminate the possibility that any significant reassimilation of this water by local infiltration has occurred given climatic conditions resembling those of today. The arguments against the local infiltration of flood water into the northern plains are two-fold. First, given the climatic and geothermal conditions that are thought to have prevailed on Mars during the Late Hesperian (the period of peak outflow channel activity in the northern plains), the thickness of the cryosphere in Chryse Planitia is likely to have exceeded 1 km. A necessary precondition for the widespread occurrence of groundwater is that the thermodynamic sink represented by the cryosphere must already be saturated with ice. For this reason, the ice-saturated cryosphere acts as an impermeable barrier that effectively precludes the local resupply of subpermafrost groundwater by the infiltration of water discharged to the surface by catastraphic floods. Note that the problem of local infiltration is not significantly improved even if the cryosphere were initially dry, for as water attempts to infiltrate the cold, dry crust, it will quickly freeze, creating a seal that prevents any further infiltration from the ponded water above. The second argument against the local infiltration of flood water in the northern plains is based on hydraulic considerations. Repeated impacts have likely brecciated the Martian crust down to a depth of roughly 10 km. Given a value of permeability no greater than that inferred for the top 10 km of the Earth's crust (approximately 10(exp -2) darcies), a timescale as much as a billion years or more for the Martian groundwater system to achieve hydrostatic equilibrium, and the approximately 2-4 km elevation difference between the outflow channel source regions and the northern plains, the water confined beneath the frozen crust of the northern plains should have been under a significant hydraulic head. Thus, the existence of a hydraulic pathway between the ponded flood waters above the northern plains and the confined aquifer lying beneath it would not have led to the infiltration of flood water back into the crust, but rather the additional expulsion of groundwater onto the surface. REGIONAL SEDIMENTOLOGICAL VARIATIONS AMONG DARK CRATER FLOOR FEATURES: TOWARD A MODEL FOR MODERN EOLIAN SAND DISTRIBUTION ON MARS Abstract Only

K. S. Edgett and P. R. Christensen *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 17-18 (For primary document see N94-33190 09-91)

Avail: CASI HC A01/MF A01

It has been known since 1972 that many Martian craters have dark features on their floors, and that when seen at higher image resolution, some of the dark units are dune fields. Interpretations of thermal inertia derived from Viking Infrared Thermal Mapper (IRTM) data have been used to suggest that many dark intracrater features, including those where dunes are not observed in images, contain some amount of sand or particles in the range 0.1-10 mm. However, it has never been known if all these dark features consist of dunes. We assembled a set of 108 carefully constrained Viking IRTM observations for dark crater-floor units. The data and selection criteria are described in detail elsewhere. Studied in conjunction with Mariner 9 and Viking orbiter images of each crater, these data indicate that the dark crater-floor units in some regions have different thermal properties than those in other regions. Thermal inertias were computed using the Viking thermal model of H. H. Kieffer and corrected for atmospheric CO2 effects using the relationship for a dust-free atmosphere shown by Haberle and Jakosky. Derived from text

AEROSOLS SCATTERING AND NEAR-INFRARED OBSERVATIONS OF THE MARTIAN SURFACE Abstract Only

S. Erard *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 18-19 (For primary document see N94-33190 09-91)

Avail: CASI HC A01/MF A01

The presence of a scattered contribution in the atmosphere of Mars is a major problem for spectroscopic observations of the surface in the infrared since the main mineralogical absorptions have a typical depth of 1% and could be easily masked or subdued by atmospheric scattering. An estimate of the aerosol contribution between 0.77 and 2.6 microns was previously derived above Tharsis from ISM imaging spectroscopic data acquired from the Phobos 2 spacecraft in 1989. It is used here to investigate the effect of the scattering on the criteria that allow the mineralogical characterization of the surface. Derived from text

A MODEL FOR THE EVOLUTION OF CO2 ON MARS Abstract Only

Robert M. Haberle, D. Tyler, C. P. McKay, and W. L. Davis *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 19-20 (For primary document see N94-33190 09-91)

Avail: CASI HC A01/MF A01

Our MSATT work has focused on the evolution of CO2 on Mars. We have constructed a model that predicts the evolution of CO2 on Mars from a specified initial amount at the end of the heavy bombardment to the present. The model draws on published estimates of the main process believed to affect the fate of CO2 during this period: chemical weathering, regolith uptake, polar cap formation, and atmospheric escape. Except for escape, the rate at which these processes act is controlled by surface temperatures that we calculate using a modified version of the Gierasch and Toon energy balance model. Various aspects of this work are covered. Derived from text

POSSIBLE TEST OF ANCIENT DENSE MARTIAN ATMOSPHERE Abstract Only
W. K. Hartmann and S. Engel *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 20 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

We have completed preliminary calculations of the minimum sizes of bolides that would penetrate various hypothetical Martian atmospheres with surface pressures ranging from 6 to 1000 mbar for projectiles of various strengths. The calculations are based on a computer program. These numbers are used to estimate the diameter corresponding to the turndown in the crater diameter distribution due to the loss of these bodies, analogous to the dramatic turndown at larger sized already discovered on Venus due to this effect. We conclude that for an atmosphere greater than a few hundred millibars, a unique downward displacement in the diameter distribution would develop in the crater diameter distribution at D approximately = 0.5-4 km, due to loss of all but Fe bolides. Careful search for this displacement globally, as outlined here, would allow us to place upper limits on the pressure of the atmosphere contemporaneous with the oldest surfaces, and possibly to get direct confirmation of dense ancient atmospheres. GROUNDBASED MONITORING OF MARTIAN ATMOSPHERIC OPACITY Abstract Only
K. E. Herkenhoff and L. J. Martin *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 20-21 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

The amount of dust in the Martian atmosphere is variable in both space and time. The presence of aerosols in the Mars atmosphere complicates quantitative analysis of Martian surface properties. We have developed a model for Mars surface and atmospheric scattering based on equations in Hillier et al (1991). This formulation was chosen for its speed of computation and because it accounts for the spherical geometry of atmospheric scattering at high mission angles, i.e., near the planetary limb. MARS ATMOSPHERIC LOSS AND ISOTOPIC FRACTIONATION BY SOLAR-WIND-INDUCED SPUTTERING AND PHOTOCHEMICAL ESCAPE Abstract Only
B. M. Jakosky, R. O. Pepin, R. E. Johnson, and J. L. Fox *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 21 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

We examine the effects of loss of Mars atmospheric constituents by solar-wind-induced sputtering and by photochemical escape during the last 3.8 b.y. Sputtering is capable of efficiently removing all species from the upper atmosphere including the light noble gases; N is removed by photochemical processes as well. Due to diffusive separation (by mass) above the homopause, removal from the top of the atmosphere will fractionate the isotopes of each species with the lighter mass being preferentially lost. For C and O, this allows us to determine the size of nonatmospheric reservoirs that mix with the atmosphere; these reservoirs can be CO2 adsorbed in the regolith or H2O in the polar ice caps. We have constructed both simple analytical models and time-dependent models of the loss from and supply of volatiles to the Martian atmosphere. Derived from text

SNC METEORITES AND THEIR IMPLICATIONS FOR RESERVOIRS OF MARTIAN VOLATILES Abstract Only
J. H. Jones *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 21-23 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

The SNC meteorites and the measurements of the Viking landers provide our only direct information about the abundance and isotopic composition of Martian volatiles. Indirect measurements include spectroscopic determinations of the D/H ratio of the Martian atmosphere. A personal view of volatile element reservoirs on Mars is presented, largely as inferred from the meteoritic evidence. This view is that the Martian mantle has had several opportunities for dehydration and is most likely dry, although not completely degassed. Consequently, the water contained in SNC meteorites was most likely incorporated during ascent through the crust. Thus, it is possible that water can be decoupled from other volatile/incompatible elements, making the SNC meteorites suspect as indicators of water inventories on Mars. Derived from text

THE NORTHERN PLAINS MSATT MEETING, AND A CALL FOR A FIELD-ORIENTED SUCCESSOR TO MSATT Abstract Only
J. S. Kargel *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 23-24 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

The workshop was devoted to a review of our knowledge of the Martian northern plains and presentation of recent ideas pertaining to the geologic and climatic evolution of this interesting region. The meeting was held in Fairbanks to allow easy access to Mars-like terrains in central and northern Alaska. There is no place on Earth that is a close analog of the Martian northern plains, but parts of Alaska come reasonably close in some respects, so we may expect that some of the processes occurring there are similar to processes that have occurred on Mars. TEMPORAL AND SPATIAL MAPPING OF ATMOSPHERIC DUST OPACITY AND SURFACE ALBEDO ON MARS Abstract Only
S. W. Lee, R. T. Clancy, G. R. Gladstone, and T. Z. Martin *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 24 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

The Mariner 9 and Viking missions provided abundant evidence that eolian processes are active over much of the surface of Mars. Past studies have demonstrated that variations in regional albedo and wind streak patterns are indicative of sediment transport through a region, while thermal inertia data (derived from the Viking Infrared Thermal Mapper (IRTM) datasets) are indicative of the degree of surface mantling by dust deposits. We are making use of the method developed by T. Z. Martin to determine dust opacity from IRTM thermal observations. We have developed a radiative transfer model that allows corrections for the effects of atmospheric dust loading on observations of surface albedo to be made. This approach to determining 'dust-corrected surface albedo' incorporates the atmospheric dust opacity, the single-scattering albedo and particle phase function of atmospheric dust, the bidirectional reflectance of the surface, and accounts for variable lighting and viewing geometry. THE EFFECT OF POLAR CAPS ON OBLIQUITY Abstract Only

B. L. Lindner *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 26-27 (For primary document see N94-33190 09-91)

(Contract NASw-4614)

Avail: CASI HC A01/MF A01

Rubincam has shown that the Martian obliquity is dependent on the seasonal polar caps. In particular, Rubincam analytically derived this dependence and showed that the change in obliquity is directly proportional to the seasonal polar cap mass. Rubincam concludes that seasonal friction does not appear to have changed Mars' climate significantly. Using a computer model for the evolution of the Martian atmosphere, Haberle et al. have made a convincing case for the possibility of huge polar caps, about 10 times the mass of the current polar caps, that exist for a significant fraction of the planet's history. Since Rubincam showed that the effect of seasonal friction on obliquity is directly proportional to polar cap mass, a scenario with a ten-fold increase in polar cap mass over a significant fraction of the planet's history would result in a secular increase in Mars' obliquity of perhaps 10 degrees. Hence, the Rubincam conclusion of an insignificant contribution to Mars' climate by seasonal friction may be incorrect. Furthermore, if seasonal friction is an important consideration in the obliquity of Mars, this would significantly alter the predictions of past obliquity. Derived from text

ESCAPE OF MARS ATMOSPHERIC CARBON THROUGH TIME BY PHOTOCHEMICAL MEANS Abstract Only

J. G. Luhmann, J. Kim, and A. F. Nagy *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 27 (For primary document see N94-33190 09-91)

Avail: CASI HC A01/MF A01

Luhmann et al. recently suggested that sputtering of the Martian atmosphere by re-entering O(+) pickup ions could have provided a significant route of escape for CO2 and its products throughout Mars' history. They estimated that the equivalent of C in an approximately 140-mbar CO2 atmosphere should have been lost this way if the Sun and solar wind evolved according to available models. Another source of escaping C (and O) that is potentially important is the dissociative recombination of ionospheric CO(+) near the exobase. We have evaluated the loss rates due to this process for 'ancient' solar EUV radiation fluxes of 1, 3, and 6 times the present flux in order to calculate the possible cumulative loss over the last 3.5 Gyr. THE DISTRIBUTION OF MARTIAN GROUND ICE AT OTHER EPOCHS Abstract Only

M. T. Mellon and B. M. Jakosky *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 29-30 (For primary document see N94-33190 09-91)

Avail: CASI HC A01/MF A01

The past orbital evolution of Mars is examined in relation to changes in ice stability as well as the condensation, sublimation, and diffusion of atmospheric water in an exchange with the regolith. The Martian obliquity has undergone significant oscillations in its recent past. During periods of high obliquity, the solar energy would have been distributed such that the equatorial and midlatitude regions would have been colder that at present and the polar regions would have been warmer. Warmer polar regions would result in the sublimation of more polar cap water into the atmosphere and thus higher atmospheric water abundances. This combination of effects would have resulted in ground ice being stable globally. During periods of low obliquity the opposite would have occurred. Modeling results of the regolith thermal behavior and the molecular diffusion of water vapor within the regolith and in exchange with the atmosphere have shown significant quantities of ground ice can form at all latitudes within the top 50 cm to 1 m of the regolith during periods of high obliquity. The amount of ice that forms can be as much as the regolith pores can hold. During low obliquity most or all of this ice sublimes and diffuses away. Below this depth a longer-term stability is observed at some latitudes where ice steadily increases in concentration regardless of orbital oscillations that occur. Derived from text

MINERALOGICAL DIVERSITY (SPECTRAL REFLECTANCE AND MOESSBAUER DATA) IN COMPOSITIONALLY SIMILAR IMPACT MELT ROCKS FROM MANICOUAGAN CRATER, CANADA Abstract Only

R. V. Morris, J. F. Bell, III, D. C. Golden, and H. V. Lauer, Jr. *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 30-32 (For primary document see N94-33190 09-91)

Avail: CASI HC A01/MF A01

Meteoritic impacts under oxidizing surface conditions occur on both earth and Mars. Oxidative alteration of impact melt sheets is reported at several terrestrial impact structures including Manicouagan, West Clearwater Lake, and the Ries Basin. A number of studies have advocated that a significant fraction of Martian soil may consist of erosional products of

oxidatively altered impact melt sheets. If so, the signature of the Fe-bearing mineralogies formed by the process may be present in visible and near infrared reflectivity data for the Martian surface. Of concern is what mineral assemblages form in impact melt sheets produced under oxidizing conditions and what their spectral signatures are. Spectral and Moessbauer data for 19 powder samples of impact melt rock from Manicouagan Crater are reported. Results show for naturally occurring materials that composite hematite-pyroxene bands have minima in the 910-nm region. Thus many of the anomalous Phobos-2 spectra, characterized by a shallow band minimum in the near-IR whose position varies between approximately 850 and 1000 nm, can be explained by assemblages whose endmembers (hematite and pyroxene) are accepted to be present on Mars. Furthermore, results show that a mineralogically diverse suite of rocks can be generated at essentially constant composition, which implies that variations in Martian surface mineralogy do not necessarily imply variations in chemical composition. CASI

MARTIAN SPECTRAL UNITS DERIVED FROM ISM IMAGING SPECTROMETER DATA Abstract Only
S. Murchie, J. Mustard, and R. Saylor *In its* Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 32-34 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

Based on results of the Viking mission, the soil layer of Mars has been thought to be fairly homogeneous and to consist of a mixture of as few as two components, a 'dark gray' basaltic material and a 'bright red' altered material. However, near-infrared reflectance spectra measured recently both telescopically and from spacecraft indicate compositional heterogeneity beyond what can be explained by just two components. In particular, data from the ISM imaging spectrometer, which observed much of the equatorial region at a spatial resolution of approximately 22 km, indicate spatial differences in the presence and abundance of Fe-containing phases, hydroxylated silicates, and H2O. The ISM data was used to define, characterize, and map soil 'units' based on their spectral properties. The spatial distribution of these 'units' were compared to morphologic, visible color, and thermal inertia features recognized in Viking data.

EDDY TRANSPORT OF WATER VAPOR IN THE MARTIAN ATMOSPHERE Abstract Only
J. R. Murphy (San Jose State Univ., CA.) and Robert M. Haberle *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 34 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

Viking orbiter measurements of the Martian atmosphere suggest that the residual north polar water-ice cap is the primary source of atmospheric water vapor, which appears at successively lower northern latitudes as the summer season progresses. Zonally symmetric studies of water vapor transport indicate that the zonal mean meridional circulation is incapable of transporting from north polar regions to low latitudes the quantity of water vapor observed. This result has been interpreted as implying the presence of nonpolar sources of water. Another possibility is the ability of atmospheric wave motions, which are not accounted for in a zonally symmetric framework, to efficiently accomplish the transport from a north polar source to the entirety of the Northern Hemisphere. The ability or inability of the full range of atmospheric motions to accomplish this transport has important implications regarding the questions of water sources and sinks on Mars: if the full spectrum of atmospheric motions proves to be incapable of accomplishing the transport, it strengthens arguments in favor of additional water sources. Preliminary results from a three dimensional atmospheric dynamical/water vapor transport numerical model are presented. The model accounts for the physics of a subliming water-ice cap, but does not yet incorporate recondensation of this sublimed water. Transport of vapor away from this water-ice cap in this three dimensional framework is compared with previously obtained zonally symmetric (two dimensional) results to quantify effects of water vapor transport by atmospheric eddies.

IRTM BRIGHTNESS TEMPERATURE MAPS OF THE MARTIAN SOUTH POLAR REGION DURING THE POLAR NIGHT: THE COLD SPOTS DON'T MOVE Abstract Only
D. A. Paige, D. Crisp, M. L. Santee, and M. I. Richardson *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 34-35 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

A series of infrared thermal mapper (IRTM) south polar brightness temperature maps obtained by Viking Orbiter 2 during a 35-day period during the southern fall season in 1978 was examined. The maps show a number of phenomena that have been identified in previous studies, including day to day brightness temperature variations in individual low temperature regions and the tendency for IRTM 11-micron channel brightness temperatures to also decrease in regions where low 20-micron channel brightness temperatures are observed. The maps also show new phenomena, the most striking of which is a clear tendency for the low brightness temperature regions to occur at fixed geographic regions. During this season, the coldest low brightness temperatures appear to be concentrated in distinct regions, with spatial scales ranging from 50 to 300 km. There are approximately a dozen of these concentrations, with the largest centered near the location of the south residual polar cap. Other concentrations are located at Cavi Angusti and close to the craters Main, South, Lau, and Dana. Broader, less intense regions appear to be well correlated with the boundaries of the south polar layered deposits and the Mountains of Mitchell. No evidence for horizontal motion of any of these regions has been detected. Author (revised)

NUMERICAL SIMULATION OF THERMALLY INDUCED NEAR-SURFACE FLOWS OVER MARTIAN TERRAIN Abstract Only
T. R. Parish and A. D. Howard *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 35-39 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

Numerical simulations of the Martian near-surface wind regime using a mesoscale atmospheric model have shown that the thermally induced near-surface winds are analogous to terrestrial circulations. In particular, katabatic wind displays a striking similarity to flow observed over Antarctica. Introduction of solar radiation strongly perturbs the slope flows; anabatic conditions develop in middle to high latitudes during the daytime hours due to the solar heating of the sloping terrain. There appears to be a rapid transition from the katabatic to the anabatic flow regimes, emphasizing the primary importance of radiative exchanges at the surface in specifying the horizontal pressure gradient force. APRON HEIGHTS AROUND STEPPED MASSIFS IN THE CYDONIA MENSAE REGION: DO THEY RECORD THE LOCAL PALEOBATHYMETRY OF OCEANUS BOREALIS? Abstract Only
T. J. Parker and D. S. Gorsline *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 39-40 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

The use of photoclinometry and shadow measurements to determine the basin volume without linking the measurements to a global datum is described. Since the boundary, or shoreline, of the basin cannot be tied to the datum and typically has no useful local relative height to measure, what is needed is a number of measurements of the height of the paleoshorelines distributed across the basin. Photoclinometric profiles are being compiled from Viking Orbiter images of the Cydonia Mensae region, which includes images with high sun elevations, necessary to avoid shadows, and images with low sun elevations, to enable the use of shadow measurements as an independent check, at high resolution (40 to 100 m/pixel). Both asymmetric and symmetric photoclinometric profile models are being used, and the results cross checked with one another to minimize errors. An apron-height map, potentially a paleobathymetric map of part of the margin of Oceanus Borealis, can be compiled from this data to determine

whether variations in apron height are consistent with a lacustrine interpretation. Derived from text

THE pH OF MARS Abstract Only
R. C. Plumb (Brown Univ., Providence, RI.), J. L. Bishop (Brown Univ., Providence, RI.), and J. O. Edwards (Brown Univ., Providence, RI.) *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 40-41 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

The Viking labeled release (LR) experiments provided data that can be used to determine the acid-base characteristics of the regolith. Constraints on the acid-base properties and redox potentials of the Martian surface material would provide additional information for determining what reactions are possible and defining formation conditions for the regolith. Calculations devised to determine the pH of Mars must include the amount of soluble acid species or base species present in the LR regolith sample and the solubility product of the carbonate with the limiting solubility. This analysis shows that CaCO3, either as calcite or aragonite, has the correct K(sub sp) to have produced the Viking LR successive injection reabsorption effects. Thus CaCO3 or another MeCO3 with very similar solubility characteristics must have been present on Mars. A small amount of soluble acid, but no more than 4 micro-mol per sample, could also have been present. It is concluded that the pH of the regolith is 7.2 +/- 0.1. Derived from text

THE MINERALOGIC EVOLUTION OF THE MARTIAN SURFACE THROUGH TIME: IMPLICATIONS FROM CHEMICAL REACTION PATH MODELING STUDIES Abstract Only
G. S. Plumlee, W. I. Ridley, J. D. DeBraal, and M. H. Reed *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 41-43 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

Chemical reaction path calculations were used to model the minerals that might have formed at or near the Martian surface as a result of volcano or meteorite impact driven hydrothermal systems; weathering at the Martian surface during an early warm, wet climate; and near-zero or sub-zero C brine-regolith reactions in the current cold climate. Although the chemical reaction path calculations carried out do not define the exact mineralogical evolution of the Martian surface over time, they do place valuable geochemical constraints on the types of minerals that formed from an aqueous phase under various surficial and geochemically complex conditions. CONTROLS ON THE CO2 SEASONAL CYCLE Abstract Only
J. B. Pollack, F. Forget, Robert M. Haberle, J. Schaeffer, and H. Lee *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 43 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

Surface pressure measurement performed by the Viking landers show substantial variations in pressure on seasonal timescales that are characterized by two local minima and two local maxima. These variations have widely been attributed to the seasonal condensation and sublimation of CO2 in the two polar regions. It has been somewhat of a surprise that the amplitude of the minimum and maximum that is dominated by the CO2 cycle in the north was much weaker than the corresponding amplitude of the south-dominated extrema. Another surprise was that the seasonal pressure cycle during years 2 and 3 of the Viking mission was so similar to that for year 1, despite the occurrence of two global dust storms during year 1 and none during years 2 and 3. An energy balance model that incorporates dynamical factors from general circulation model (GCM) runs in which the atmospheric dust opacity and seasonal date were systematically varied was used to model the observed seasonal pressure variations. The energy balance takes account of the following processes in determining the rates of CO2 condensation and sublimation at each longitudinal and latitudinal grid point: solar radiation, infrared radiation from the atmosphere and surface, subsurface heat conduction, and atmospheric heat advection. Condensation rates are calculated both at the surface and in the atmosphere. In addition, the energy balance model also incorporates information from the GCM runs on seasonal redistribution of surface pressure across the globe. Estimates of surface temperature of the seasonal CO2 caps were used to define the infrared radiative losses from the seasonal polar caps. The seasonal pressure variations measured at the Viking lander sites were closely reproduced. Author (revised)

THE WAVELENGTH DEPENDENCE OF MARTIAN ATMOSPHERIC DUST RADIATIVE PROPERTIES Abstract Only
J. B. Pollack, M. E. Ockert-Bell, R. Arvidson, and M. Shepard *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 44 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

One of the key radiative agents in the atmosphere of Mars is the suspended dust particles. A new analysis of two data sets of the Martian atmosphere is being carried out in order to better evaluate the radiative properties of the atmospheric dust particles. The properties of interest are the size distribution, optical constants, and other radiative properties, such as the single-scattering albedo and phase function. Of prime importance is the wavelength dependence of these radiative properties throughout the visible and near-infrared wavelengths. Understanding the wavelength dependence of absorption and scattering characteristics will provide a good definition of the influence that the atmospheric dust has on heating of the atmosphere. MARTIAN DELTAS: MORPHOLOGY AND DISTRIBUTION Abstract Only
J. W. Rice, Jr. and D. H. Scott *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 45-46 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

Recent detailed mapping has revealed numerous examples of Martian deltas. The location and morphology of these deltas are described. Factors that contribute to delta morphology are river regime, coastal processes, structural stability, and climate. The largest delta systems on Mars are located near the mouths of Maja, Maumee, Vedra, Ma'adim, Kasei, and Brazos Valles. There are also several smaller-scale deltas emplaced near channel mouths situated in Ismenius Lacus, Memnonia, and Arabia. Delta morphology was used to reconstruct type, quantity, and sediment load size transported by the debouching channel systems. Methods initially developed for terrestrial systems were used to gain information on the relationships between Martian delta morphology, river regime, and coastal processes. Author (revised)

CARBONATE FORMATION ON MARS: LATEST EXPERIMENTS Abstract Only
S. K. Stephens, D. J. Stevenson, G. R. Rossman, and L. F. Keyser *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 46-48 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

Laboratory simulations of Martian CO2 storage address whether carbonate formation could have reduced CO2 pressure from a hypothetical greater than 1 bar to the present 7 mbar in less than or equal to 3 to 4 billion years. This problem is addressed with experiments and analysis designed to verify and improve previous kinetic measurements, reaction mechanisms, and product characterizations, with the goal of improving existing models of Martian CO2 history. A sensitive manometer monitored the pressure drop of CO2 due to uptake by powdered silicate for periods of 3 to 100+ days. Pressure drops for diopside 1 and basalt show rapid short-term (approximately one day) CO2 uptake and considerably slower long-term pressure drops. Curves for diopside 2, olivine 1, and olivine 2 are qualitatively similar to those for diopside 1, whereas quartz and plagioclase show near-zero short-term pressure drops and very slow long-term signals, indistinguishable from a leak (less than 10(exp 11) mol/sq m/s). POLAR SEDIMENT ACCUMULATION: ROLE OF SURFACE WINDS AT THE TWO POLES Abstract Only
P. C. Thomas and P. J. Gierasch *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 49 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

The accumulation of the large deposits of volatile and nonvolatile sediments at both Martian poles has occurred through periods of likely climate change. Most data on wind directions near the Martian poles and seasonal activity relate to a very short period of time, at one point in climate cycles. It is still uncertain what the net budgets to the poles are and how this budget (if known) would fit into longer climate/sediment cycles. Pending further data we examined the full suite of Viking high-resolution, high-latitude images for wind markers of all sizes and types. These probably represent timescales of formation from days to several tens of thousands of years. The goal is to estimate the effectiveness, and possible drivers, of wind systems that bring materials near the surface to the regions of polar sediments and that also remove materials from the polar areas. THE MARTIAN SOURCES OF THE SNC METEORITES (TWO, NOT ONE), AND WHAT CAN AND CAN'T BE LEARNED FROM THE SNC METEORITES Abstract Only
A. H. Treiman *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 49-51 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

The SNC meteorites, which almost certainly originate in the Martian crust, have been inferred to come from a single impact crater site, but no known crater fits all criteria. Formation at two separate sites (S from one, NC from the other) is more consistent with the sum of petrologic, geochronologic, and cosmochronologic data. If the source craters for the SNC meteorites can be located, Mars science will advance considerably. However, many significant questions cannot be answered by the SNC meteorites. These questions await a returned sample. Author

TEMPORAL CHANGES IN THE GEOGRAPHIC DISTRIBUTION, ELEVATION, AND POTENTIAL ORIGIN OF THE MARTIAN OUTFLOW CHANNELS Abstract Only
S. Tribe and S. M. Clifford *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 51-52 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

Observational evidence of outflow channel activity on Mars suggests that water was abundant in the planet's early crust. However, with the decline in the planet's internal heat flow, a freezing front developed within the regolith that propagated downward with time and acted as a thermodynamic sink for crustal H2O. One result of this thermal evolution is that, if the initial inventory of water on Mars was small, the cryosphere may have grown to the point where all the available water was taken up as ground ice. Alternatively, if the inventory of H2O exceeds the current pore volume of the cryosphere, then Mars has always possessed extensive bodies of subpermafrost groundwater. We have investigated the relative age, geographic distribution, elevation, and geologic setting of the outflow channels in an effort to accomplish the following: (1) identify possible modes of origin and evolutionary trends in their formation; (2) gain evidence regarding the duration and spatial distribution of groundwater in the crust; and (3) better constraint estimates of the planetary inventory of H2O. OBLIQUITY VARIATION IN A MARS CLIMATE EVOLUTION MODEL Abstract Only
D. Tyler (San Jose State Univ., CA.) and Robert M. Haberle *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 52-53 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

The existence of layered terrain in both polar regions of Mars is strong evidence supporting a cyclic variation in climate. It has been suggested that periods of net deposition have alternated with periods of net erosion in creating the layered structure that is seen today. The cause for this cyclic climatic behavior is variation in the annually averaged latitudinal distribution of solar insolation in response to obliquity cycles. For Mars, obliquity variation leads to major climatological excursion due to the condensation and sublimation of the major atmospheric constituent, CO2. The atmosphere will collapse into the polar caps, or existing caps will rapidly sublimate into the atmosphere, dependent upon the polar surface heat balance and the direction of the change in obliquity. It has been argued that variations in the obliquity of Mars cause substantial departures from the current climatological values of the surface pressure and the amount of CO2 stored in both the planetary regolith and polar caps. In this new work we have modified the Haberle et al. model to incorporate variable obliquity by allowing the polar and equatorial insolation to become functions of obliquity, which we assume to vary sinusoidally in time. As obliquity varies in the model, there can be discontinuities in the time evolution of the model equilibrium values for surface pressure, regolith, and polar cap storage. The time constant, tau r, for the regolith to find equilibrium with the climate is estimated--depending on the depth, thermal conductivity, and porosity of the regolith--between 10(exp 4) and 10(exp 6) yr. Thus, using 2000-yr timesteps to move smoothly through the 0.1250 m.y. obliquity cycles, we have an atmosphere/regolith system that cannot be assumed in equilibrium. We have dealt with this problem by limiting the rate at which CO2, can move between the atmosphere and regolith, mimicking the diffusive nature and effects of the temperature and pressure waves, by setting the time rate of change of regolith storage proportional to the difference between equilibrium storage and current storage. DIELECTRIC PROPERTIES OF MARS' SURFACE: PROPOSED MEASUREMENT ON A MARS LANDER Abstract Only
S. Ulamec and R. Grard *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993

p 53-54 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

Recent studies of missions to Mars (MESUR by NASA and Marsnet by ESA) have suggested the development of semihard landers. One type was to be extremely basic, consisting mainly of a meteorological package, but with the possibility of other small, low-mass, low-power instruments. In particular, this type of lander was also considered for the exploration of the polar regions. Two methods to investigate the surface material at the landing site are discussed. Both measure the dielectric constant epsilon of the ground material. This information can then be used to elucidate the surface composition and structure. The determination of the permittivity would be of high scientific value, especially in the case of a landing on the polar ice. Author

THE INFLUENCE OF THERMAL INERTIA ON MARS' SEASONAL PRESSURE VARIATION AND THE EFFECT OF THE WEATHER COMPONENT Abstract Only
S. E. Wood and D. A. Paige *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 54-56 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

Using a Leighton-Murray type diurnal and seasonal Mars thermal model, we found that it is possible to reproduce the seasonal variation in daily-averaged pressures (approximately 680-890 Pa) measured by Viking Lander 1 (VL1), during years without global dust storms, with a standard deviation of less than 5 Pa. In this simple model, surface CO2, frost condensation, and sublimation rates at each latitude are determined by the net effects of radiation, latent heat, and heat conduction in subsurface soil layers. An inherent assumption of our model is that the seasonal pressure variation is due entirely to the exchange of mass between the atmosphere and polar caps. However, the results of recent Mars GCM modeling have made it clear that there is a significant dynamical contribution to the seasonal pressure variation. This 'weather' component is primarily due to large-scale changes in atmospheric circulation, and its magnitude depends somewhat on the dust content of the atmosphere. The overall form of the theoretical weather component at the location of VL1, as calculated by the AMES GCM, remains the same over the typical range of Mars dust opacities. Author (revised)

CARBONATES, SURFATES, PHOSPHATES, NITRATES, AND ORGANIC MATERIALS: THEIR ASSOCIATION IN A MARTIAN METEORITE Abstract Only
I. P. Wright, M. M. Grady, and C. T. Pillinger *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 56-57 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

The debate concerning the evolution of CO2 on Mars continues. It would appear that in order to explain the valley networks and other relict fluvial landforms it is necessary to accept that liquid water was once present at the surface of Mars. This in turn requires, at some point in the planet's history, a higher surface temperature than exists today, proposition explained traditionally by an early dense CO2, atmosphere. However, there are a number of problems with this notion: for instance, CO2 alone is not an efficient greenhouse gas because of its tendency to form clouds. Moreover, if there was an early dense CO2 atmosphere, it is necessary to explain where the elemental constituents now reside. There are two possibilities for the latter, namely loss to outer space of atmospheric CO2 or the formation of vast carbonate deposits. While some models of atmospheric loss predict that up to 0.4 bar of CO2 could be removed from the Martian surface, this is still not enough to account for the original atmospheric inventory, usually considered to have been in the range of 1-5 bar. Thus, most models of the evolution of the Martian surface require removal of CO2 from the atmosphere and into carbonate deposits. However, as yet, the evidence for the existence of carbonates on Mars is fairly scant. This is an issue that would have been resolved by results obtained from Mars Observer. Author (revised)

SIMULTANEOUS LABORATORY MEASUREMENTS OF CO2 AND H2O ADSORPTION ON PALAGONITE: IMPLICATIONS FOR THE MARTIAN CLIMATE AND VOLATILE RESERVOIR Abstract Only
A. P. Zent and R. Quinn *In* Lunar and Planetary Inst., Mars: Past, Present, and Future. Results from the MSATT Program, Part 1 1993 p 57-58 (For primary document see N94-33190 09-91)
Avail: CASI HC A01/MF A01

We are measuring the simultaneous adsorption of H2O and CO2 on palagonite materials in order to improve the formulation of climate models for Mars. We report on the initial co-adsorption data. Models of the Martian climate and volatile inventory indicate that the regolith serves as one of the primary reservoirs of outgassed volatiles and that it exchanges H2O and CO2 with the atmosphere in response to changes in insolation associated with astronomical cycles. Physical adsorbate must exist on the surfaces of the cold particulates that constitute the regolith, and the size of that reservoir can be assessed through laboratory measurements of adsorption on terrestrial analogs. Many studies of the independent adsorption of H2O and CO2 on Mars analog were made and appear in the literature. Empirical expressions that relate the adsorptive coverage of each gas to the temperature of the soil and partial pressure have been derived based on the laboratory data. Numerical models incorporate these adsorption isotherms into climatic models, which predict how the adsorptive coverage of the regolith and hence, the pressure of each gas in the atmosphere will vary as the planet moves through its orbit. These models suggest that the regolith holds several tens to hundreds of millibars of CO2 and that during periods of high obliquity warming of the high-latitude regolith will result in desorption of the CO2, and a consequent increase in atmospheric pressure. At lower obliquities, the caps cool and the equator warms forcing the desorption of several tens of millibars of CO2, which is trapped into quasipermanent CO2 caps. Author (revised)

EVIDENCE OF SOLAR OSCILLATIONS IN RAYLEIGH-SCATTERED LIGHT Ph.D. Thesis
Marvin Edward Germain 1993 119 p
Avail: Univ. Microfilms Order No. DA9328609

A new instrument has been developed for making unimaged whole-disk observations of low-degree solar normal-mode oscillations. The apparatus, referred to as the sky monitor, does not track the solar disk, but instead measures the radiant flux scattered by the earth's atmosphere at 1.6 and 0.5 mu. The expected diurnal flux variation was obtained from a detailed radiative transfer calculation. Data were acquired for 15.5 months during 1991-92. Seventy-two days of data were analyzed for evidence of solar p modes in the frequency range 1800 to 4776 micro-Hz. Noise generated by the earth's atmosphere was reduced by scaling the Fourier amplitude computed from the infrared signal and subtracting it from the Fourier amplitude computed from the visible signal. A superimposed frequency analysis was then performed which revealed approximately 2 sigma peaks within 0.3 micro-Hz of symmetry-allowed locations, while no excess power was detected at the symmetry-forbidden frequencies. The probability of obtaining by chance the observed excess power density at symmetry-allowed frequencies and deficit of power density at symmetry-forbidden frequencies was computed to be 6.9 x 10(exp -3). Correcting the frequencies for solar-cycle variations, the probability was reduced to 2.9 x 10(exp -4). These results indicate that it is quite unlikely that the observed symmetry properties have occurred by chance, and support the hypothesis that solar normal-mode signals are manifested in the data. The amplitudes l prime/l(sub 0) averaged over radial order n of the $l = 0$ and $l = 2$, $m = 0$ modes were found to be (7.54 +/- 0.54) x 10(exp -7) and (7.68 +/- 0.56) x 10(exp -7), respectively. These results are about a factor of two smaller than the amplitude of total irradiance oscillations measured from space. While the rotational splitting of the $l = 2$ multiplet appears to be consistent

with that reported by Hill, results for l = 1 and l = 3 are inconclusive.

USERS MANUAL FOR SERI QC SOFTWARE ASSESSING THE QUALITY OF SOLAR RADIATION DATA
Dec. 1993 201 p
(Contract DE-AC02-83CH-10093)
(DE93-018210; NREL/TP-463-5608) Avail: CASI HC A10/MF A03

This manual describes the procedures and software for assessing the quality of solar radiation data. This does not constitute quality control because quality control must take place during the preparations for data collection (selection, calibration, and installation of instruments), during the measurement process, and during the transmission (if any) and recording of the numerical values. Once the data are recorded, only quality assessment can be performed. If quality assessment is performed in real time or soon after the measurement process is completed, it can provide input to control the quality of future measurements. Furthermore, quality assessment can be used for quality control if data judged to be bad are deleted and/or modified. We do not subscribe to these actions because the deletion or modification of data destroys information that might be useful to the user. For example, if an instrument has gone through a gradual failure and all of the data that fail quality assessment criteria are deleted or modified, the user of the data may not be able to detect what was happening and will not question the accuracy of other data collected before the instrument completely failed. Therefore, the SERI QC procedures and software do not delete or modify data. Instead, flags are set to inform the user of any departure of the data from expected values. These flags indicate the magnitude and direction of such departures. For the flags to communicate as much information as possible, this manual attempts to identify and explain the probable causes of various flags. However, we cannot overemphasize the following: Flags only indicate that data do or do not fall within expected ranges. This does not mean that the data are or are not valid. DOE

SOLAR PHYSICS AND TERRESTRIAL EFFECTS. A CURRICULUM GUIDE FOR TEACHERS, GRADE 7-12
Roger P. Briggs (Boulder Valley Public Schools, CO.), Robert J. Carlisle (Boulder Valley Public Schools, CO.), and Barbara B. Poppe Dec. 1993 100 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-142247) Avail: Issuing Activity (National Technical Information Service (NTIS))

The guide consists of three main parts: a short textbook, a hands-on activity guide, and resource listings. The textbook should provide the necessary background in solar physics for teachers. It could also be used by students, but is written largely at an adult level and therefore may not be easily understood by younger students. Problems for more advanced students are included at the end of each of the four sections and answers to the problems are given at the end of the section. The activity section offers ideas for hands-on experiences that can be done in the classroom, using materials that are cheap and easily available. Background information is available in the text for the activities. The resources and references section contains a wealth of further possibilities for exploring solar-terrestrial physics, including software, telecommunications, books, and supplies.

THEORETICAL STUDIES OF MAGNETOHYDRODYNAMIC EQUILIBRIA AND DYNAMICS OF A SOLAR CORONAL LOOP Ph.D. Thesis
Dana Warfield Longcope 1993 355 p
Avail: Univ. Microfilms Order No. DA9318794

This work is concerned with the time evolution, both quasistatic and dynamical, of the magnetic fields in the solar corona, and its implications for the problem of solar coronal heating. A theoretical study is made of a collection of closed magnetic flux tubes whose footpoints are subject to slow, complicated photospheric displacements. A simple model is developed in which the effects of gravitation and curvature are ignored and the flux tubes are assumed to be long and thin. The governing equations for this model are those of nonideal reduced magnetohydrodynamics. A formalism is developed for isolating the purely quasistatic component of the system's evolution. Analytic calculations are carried out using this formalism to investigate the development of small-scale magnetic structure resulting from the footpoint motions, called a magnetic cascade. Furthermore the formalism admits a scenario whereby quasistatic evolution is interrupted by spontaneous dynamical behavior. This occurs when the present equilibrium is neutrally stable to a current driven MHD instability. The nonideal equations are solved under conditions of slow, continuous, random driving using a time dependent three dimensional computer code. The system is found to achieve a statistical steady state in which the electromechanical work done by the driving is balanced by ohmic and viscous dissipation. The most evident spatial features of these solutions are three dimensional current sheets which develop spontaneously in the interior. These are analyzed using Sweet-Parker reconnection theory. The global properties of the statistical steady state can be explained in terms of these current sheets. It is proposed that the observed current sheets develop when the present MHD equilibrium becomes unstable to current driven instabilities. At such a point the system would relax abruptly to a new equilibrium with lower magnetic energy, thereby liberating its excess energy as heat. A picture of this process is presented in terms of a greatly simplified low-dimensional analog of the reduced MHD system. This low-dimensional system is evolved numerically for long times and found to exhibit relaxations of varying amplitudes at random intervals. The statistical distribution of these events is compared to similar distributions observed in the solar corona. Dissert. Abstr.

STEPS TOWARD UNDERSTANDING THE SOLAR DYNAMO Annual Report, 1 Feb. 1992 - 31 Jul. 1993
Barry LaBonte 31 Jul. 1993 18 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0116-90)
(AD-A277398; AFOSR-94-0098TR) Avail: CASI HC A03

Progress has been made toward solving the problem of the solar dynamo. The flux tube dynamo has been defined as a promising model for future investigation. Surface solar magnetic fields have been observed to determine whether electric currents carried by the fields can yield information about the dynamo region. Observational tools have been developed to probe the internal solar magnetic fields. DTIC

A COMPREHENSIVE ANALYSIS OF ELECTRON CONICAL DISTRIBUTIONS FROM MULTI-SATELLITE DATABASES Final Report
J. Douglas Menietti 1993 27 p
(Grant NAG5-2102; U-of-I Proj. 14251600)
(NASA-CR-195848; NAS 1.26:195848) Avail: CASI HC A03/MF A01

This report consists of a copy of a paper that has been submitted to the 'Journal of Geophysical Research', entitled 'DE 1 and Viking Observations Associated With Electron Conical Distributions,' and an abstract of another paper (included as an appendix to the report) that is about to be submitted to the same journal entitled 'Perpendicular Electron Heating by Absorption of Auroral Kilometric Radiation.' A bibliography of other papers that have been published as a result of this project follows. The purpose of this project was to use the DE 1 and Viking particle and wave data to better understand the source mechanism of electron conical distributions. We have shown that electron conics are often associated with upper hybrid

waves in the nightside auroral region. We have also shown that electron conics are observed near auroral kilometric radiation (AKR) source regions and may be the result of perpendicular heating due to waves. We have completed a statistical study of electron conics observed by DE-I and Viking. The study shows the occurrence frequency and location of electron conical distributions; there are some differences between the results of DE and Viking perhaps due to different regions sampled. HIGH SENSITIVITY AND RESOLUTION DECIMETRIC SPECTROSCOPE: PRELIMINARY ANALYSIS OF SOLAR BURSTS M.S. Thesis
Francisco Carlos Roc Fernandes Jun. 1992 146 p In PORTUGESE (INPE-5537-TDI/525) Avail: CASI HC A07/MF A02

High sensitivity radio spectroscope in conjunction with a 9 meter diameter polar mounted antenna has been put into regular operation since December 1990. Spectroscope operates over band of 1600 +/- 100 MHz with high time (20-100 ms) and frequency (0.3-3 MHz) resolution. The data is recorded on 35 mm black and white film and is digitized. Characteristics of the antenna at various elevations and that of spectroscope are described in detail. Limitations of the existing spectroscope and near future plans are also presented. Up to January 1992, about 162 groups of solar bursts have been recorded by this spectroscope. They have been classified in two major categories: microwave and decimetric bursts, generated due to gyrosynchrotron and beam plasma interactions, respectively. Preliminary characteristics of 44 groups of the decimetric bursts, such as of the observed flux, total duration, and excitation and decay time, have suggested that they are likely to be decimetric type 3 bursts and are generated at the second harmonic by beam plasma interaction. Estimated beam density is of the order of 10(exp 4) cm(exp -3). Author (revised)

The final phase of Grant NAG6-1 involved analysis of physics of chemical releases in the upper atmosphere and analysis of data obtained on previous NASA sponsored chemical release rocket experiments. Several lines of investigation of past chemical release experiments and computer simulations have been proceeding in parallel. This report summarizes the work performed and the resulting publications. The following topics are addressed: analysis of the 1987 Greenland rocket experiments; calculation of emission rates for barium, strontium, and calcium; the CRIT 1 and 2 experiments (Collisional Ionization Cross Section experiments); image calibration using background stars; rapid ray motions in ionospheric plasma clouds; and the NOONCUSP rocket experiments. For individual titles, see N94-31102 through N94-31102.

An experimental campaign designed to study high-latitude auroral arcs was conducted in Sondre Stromfjord, Greenland, on February 26, 1987. The Polar Acceleration Regions and Convection Study (Polar ARCS) consisted of a coordinated set of ground-based, airborne, and sounding rocket measurements of a weak, sun-aligned arc system within the duskside polar cap. A rocket-borne barium release experiment, two DMSP satellite overflights, all-sky photography, and incoherent scatter radar measurements provided information on the large-scale plasma convection over the polar cap region while a second rocket instrumented with a DC magnetometer, Langmuir and electric field probes, and an electron spectrometer provided measurements of small-scale electrodynamics. The large-scale data indicate that small, sun-aligned precipitation events formed within a region of antisunward convection between the duskside auroral oval and a large sun-aligned arc further poleward. This convection signature, used to assess the relationship of the sun-aligned arc to the large-scale magnetospheric configuration, is found to be consistent with either a model in which the arc formed on open field lines on the dusk side of a bifurcated polar cap or on closed field lines threading an expanded low-latitude boundary layer, but not a model in which the polar cap arc field lines map to an expanded plasma sheet. The antisunward convection signature may also be explained by a model in which the polar cap arc formed on long field lines recently reconnected through a highly skewed plasma sheet. The small-scale measurements indicate the rocket passed through three narrow (less than 20 km) regions of low-energy (less than 100 eV) electron precipitation in which the electric and magnetic field perturbations were well correlated. These precipitation events are shown to be associated with regions of downward Poynting flux and small-scale upward and downward field-aligned currents of 1-2 micro-A/sq m. The paired field-aligned currents are associated with velocity shears (higher and lower speed streams) embedded in the region of antisunward flow. Author

THEORETICAL STUDIES OF X RAY EMISSION FROM CLUSTERS OF GALAXIES Ph.D. Thesis
John C. Tsai 1992
Avail: Issuing Activity (MIT Libraries, Rm. 14-0551, Cambridge, MA 02139-4307)

We have studied X-ray emission from clusters of galaxies by adopting two complementary approaches. The first consists of a detailed analysis of the available data on a single cluster. For this we have chosen to study the gas around M87 because it is the best observed cluster X-ray source and because all of the data have hitherto not been considered simultaneously. The second approach consists of studying the X-ray emission from a simulated cluster of galaxies. For this, we have used the cluster simulation of Katz & White. We have tested the CDM theory of structure formation by analyzing the nature of the cluster gas and by comparing the simulated cluster to real clusters. The cluster has also been used to test the accuracy of the standard deprojection technique used by observers to extract the cluster mass profile. We have reached the following conclusions concerning the intracluster gas around M87. First, the available data cannot be adequately modeled with density and temperature profiles that are single valued functions of radius (a single phase model). Because of this, we have investigated two multi-phase medium models. The first is the local timescale model of White & Sarazin and the second is an ad hoc power law model where the rate at which mass drops out of the ambient (single phase) medium is simply a power law in radius. We find that the models of White & Sarazin provide an improved fit to the data, whereas the power law model does not. This implies both that the data require

mass to be dropping out of the ambient medium and that the dropout rate is well parameterized by the local timescale model. The inferred mass accretion rates are consistent with previous determinations. The putative identification of absorption above the Galactic value from SSS data is not confirmed by our analysis. Moreover, we find that data from the SSS are inconsistent with those of the Einstein Observatory HRI and FPCS. Finally we study a self-consistent model where the gas that drops out of the flow in the local timescale model becomes X-ray absorbing gas.

VARIOUS MAGNET OPTIONS FOR DELTA LAUNCHED VERSION OF ASTROMAG
M. A. Green Jul. 1993 7 p Presented at the International Cryogenic Engineering Conference and International Cryogenic Materials Conference, Albuquerque, NM, 12-16 Jul. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC03-76SF-00098)
(DE94-006292; LBL-35003; CONF-930703-43) Avail: CASI HC A02

This report compares various superconducting magnet options for use in a particle astrophysics experiment to be launched with a Delta rocket into a sun synchronous orbit and an earth trailing solar orbit. The goals of the experiment are to study the incidence of anti particles coming from deep space and to study populations of light nuclei (up to atomic number 8) and gamma rays from deep space. The proposed superconducting coils, which would be made with an aluminum stabilized niobium titanium superconductor, would be cooled using stored superfluid helium. Both a sun synchronous orbit and an earth trailing solar orbit permit one to shield the magnetic and cryogen vessel behind the solar panels. This permits one to reduce the temperature of the cryostat outer vessel which results in an increased cryogen lifetime for the experiment. A number of superconducting coil and cryostat options were looked at in terms of total magnetic and cryostat mass, cryogen life time, complexity, and overall particle astrophysics capability for the attached detectors. NEUTRON MEASUREMENTS AT THE COMMERCIAL AIRCRAFT ALTITUDES M.S. Thesis
Richard Kosierb Apr. 1993 207 p
(ISBN-0-315-86201-7; CTN-94-61185) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

To provide more complete information of the neutron component of the galactic cosmic ray field at aircraft altitudes, an investigation was conducted in which a group of Air Canada and Air France pilots routinely carried neutron bubble detectors on their normal flight duties for a period of about one year. Each pilot carried one dosimeter, activating it on takeoff and resetting it on landing. A data base of over 600 flights was obtained. This work yielded measurements of the fast neutron flux of 1.436 to 2.259 neutrons per square cm per second (ncms) for the Air Canada and 2.033 to 2.909 ncms for the Air France flights. In addition, the pilots typically experienced an annual total dose equivalent (including neutrons and gamma rays) of 3.1 to 3.9 millisieverts per year. These results are found to be in agreement with other experimental and theoretical work. Consequently, the total dose equivalent experienced by the air crew is clearly above the new recommended dose limit of one millisievert per year for the general public, which would classify the flight crews in the same category as an atomic radiation worker. RADIO EMISSION FROM PRE-MAIN-SEQUENCE STARS Ph.D. Thesis
Stephen Lee Skinner 1992 258 p
Avail: Univ. Microfilms Order No. DA9318135

This study focuses on the properties and physical origin of radio continuum emission from pre-main-sequence (PMS) stars. These are young stars, typically less than a few million years old, and are still in a phase of gravitational contraction that will ultimately be halted by the onset of hydrogen burning in their cores. First, I address the question of the origin of centimeter continuum emission in intermediate mass (approx. equal to 3-20 solar mass) PMS stars, the so-called 'Herbig Ae/Be stars'. A high-sensitivity radio survey of 57 such stars was undertaken using the Very Large Array and Australia Telescope, resulting in the detection of twelve stars. These observations provide a homogenous data base consisting of information on source sizes, radio luminosities, variability timescales, circular polarization, and spectral energy distributions in the wavelength range 2-20 cm. Using these data along with previously published spectroscopy, I conclude that centimeter radio emission from Herbig Ae/Be stars is predominantly thermal and in many cases wind-related. An unexpected result of the above program was the serendipitous detection of circularly polarized radio emission in the low mass (approx. equal to 1 solar mass) PMS star Hubble 4, a member of the class of 'weak-lined T Tauri stars' (WTTS). This provides some of the most convincing evidence to date for the existence of ordered magnetic fields in WTTS. In a second observing program, I have searched for evidence of cold (less than or equal to 50 K) circumstellar dust around WTTS, which might exist in the form of remnant disks. Of the sixteen WTTS that were observed in the wavelength range 450-1100 microns using the James Clerk Maxwell Telescope, only V836 Tau was detected. Its spectral energy distribution longward of 10 microns is consistent with that expected for a flat, axisymmetric circumstellar disk of mass approx. equal to 0.04 solar mass (= 42 Jupiter masses). This star may be a rare example of an object in which disk dispersal is underway, but not yet complete. Dissert. Abstr.

A SEARCH FOR 100 TeV GAMMA RAY EMISSION FROM THE X RAY BINARY PULSAR 4U 0115+63 USING THE CYGNUS EXTENSIVE AIR-SHOWER ARRAY Ph.D. Thesis
Dimitris E. Alexandreas 1992 84 p
Avail: Univ. Microfilms Order No. DA9317861

A search has been performed for unpulsed and pulsed ultra high energy gamma ray emission from the x ray transient binary pulsar 4U 0115+63 over timescales ranging from one source-day to the entire data set. The motivation has been the detection at TeV energies of 4U 0115+63 by the Cerenkov telescope at Dugway, operated by the University Durham. The search has been performed in the database of the CYGNUS 1 extensive air-shower array that extends from April 1986 to March 1992 and contains 17,000 hours of data from the source direction. In the search for unpulsed emission, the background is estimated by creating random events from the actually detected data set, and the Li and Ma statistic is used to evaluate the statistical significance of a background fluctuation. The Rayleigh test and its power are employed in the search for pulsed emissions. No statistically significant evidence for emission can be found. No correlation with its 24-day orbital period can be seen. A 90 percent confidence level upper limit on the unpulsed continuous flux from 4U 0115+63 above 130 TeV is 7.0 x 10(exp -15) cm(exp -2) s(exp -1). This value agrees with that of the Whipple collaboration but is at least one order of magnitude lower than other upper limits or claimed detections. Dissert. Abstr.

The requirements of a gamma-ray burst optical counterpart detector are reviewed. By taking advantage of real-time notification of bursts, new instruments can make sensitive searches while the gamma-ray transient is still in progress. A wide field of view camera at Livermore National Laboratories has recently been adapted for detecting GRB optical counterparts to a limiting magnitude of 8. A more sensitive camera, capable of reaching m(sub upsilon) = 14, is under development. DOE

At Brookhaven National Laboratory the Laboratory Directed Research and Development (LDRD) Program is a discretionary research and development tool critical in maintaining the scientific excellence and vitality of the laboratory. It is also a means to stimulate the scientific community, fostering new science and technology ideas, which is the major factor in achieving and maintaining staff excellence, and a means to address national needs, within the overall mission of the Department of Energy and Brookhaven National Laboratory. This report summarizes research which was funded by this program during fiscal year 1993. The research fell in a number of broad technical and scientific categories: new directions for energy technologies; global change; radiation therapies and imaging; genetic studies; new directions for the development and utilization of BNL facilities; miscellaneous projects. Two million dollars in funding supported 28 projects which were spread throughout all BNL scientific departments. DOE

In this paper, we describe the GARIC (Generalized Approximate Reasoning-Based Intelligent Control) architecture, which learns from its past performance and modifies the labels in the fuzzy rules to improve performance. It uses fuzzy reinforcement learning which is a hybrid method of fuzzy logic and reinforcement learning. This technology can simplify and automate the application of fuzzy logic control to a variety of systems. GARIC has been applied in simulation studies of the Space Shuttle rendezvous and docking experiments. It has the potential of being applied in other aerospace systems as well as in consumer products such as appliances, cameras, and cars. Author

A fuzzy classifier system that discovers rules for controlling a mathematical model of a pH titration system was developed by researchers at the U.S. Bureau of Mines (USBM). Fuzzy classifier systems successfully combine the strengths of learning classifier systems and fuzzy logic controllers. Learning classifier systems resemble familiar production rule-based systems, but they represent their IF-THEN rules by strings of characters rather than in the traditional linguistic terms. Fuzzy logic is a tool that allows for the incorporation of abstract concepts into rule based-systems, thereby allowing the rules to resemble the familiar 'rules-of-thumb' commonly used by humans when solving difficult process control and reasoning problems. Like learning classifier systems, fuzzy classifier systems employ a genetic algorithm to explore and sample new rules for manipulating the problem environment. Like fuzzy logic controllers, fuzzy classifier systems encapsulate knowledge in the form of production rules. The results presented in this paper demonstrate the ability of fuzzy classifier systems to generate a fuzzy logic-based process control system. Author (revised)

A fuzzy-neural control system simulation was developed for the control of a camera platform used to observe aircraft on final approach to an

aircraft carrier. The fuzzy-neural approach to control combines the structure of a fuzzy knowledge base with a supervised neural network's ability to adapt and improve. The performance characteristics of this hybrid system were compared to those of a fuzzy system and a neural network system developed independently to determine if the fusion of these two technologies offers any advantage over the use of one or the other. The results of this study indicate that the fuzzy-neural approach to control offers some advantages over either fuzzy or neural control alone. Author

Artificial neural systems (ANS), also known as neural networks, are an attempt to develop computer systems that emulate the neural reasoning behavior of biological neural systems (e.g. the human brain). As such, they are loosely based on biological neural networks. The ANS consists of a series of nodes (neurons) and weighted connections (axons) that, when presented with a specific input pattern, can associate specific output patterns. It is essentially a highly complex, nonlinear, mathematical relationship or transform. These constructs have two significant properties that have proven useful to the authors in signal processing and process modeling: noise tolerance and complex pattern recognition. Specifically, the authors have developed a new network learning algorithm that has resulted in the successful application of ANS's to high speed signal processing and to developing models of highly complex processes. Two of the applications, the Weld Bead Geometry Control System and the Welding Penetration Monitoring System, are discussed in the body of this paper.

Neural networks are an outgrowth of interdisciplinary studies concerning the brain. These studies are guiding the field of Artificial Intelligence towards the, so-called, 6th Generation Computer. Enormous amounts of resources have been poured into R/D. Wavelet Transforms (WT) have replaced Fourier Transforms (FT) in Wideband Transient (WT) cases since the discovery of WT in 1985. The list of successful applications includes the following: earthquake prediction; radar identification; speech recognition; stock market forecasting; FBI finger print image compression; and telecommunication ISDN-data compression. NCCOSC RDT&E Division (NRaD) is conducting research into ways of improving decision support systems (DSS) that are used in tactical Navy decision making situations. The research has focused on the incorporation of findings about naturalistic decision-making processes into the design of the DSS. As part of that research, two computer tools were developed that model the two primary naturalistic decision-making strategies used by Navy experts in tactical settings. Current work is exploring how best to incorporate the information produced by those tools into an existing simulation of current Navy decision support systems. This work has implications for any applications involving the need to make decisions under time constraints, based on incomplete or ambiguous data. Author

This paper presents an overview of a Decision Support System (DSS) that incorporates Knowledge-Based (KB) and commercial off the shelf (COTS) technology components. The Knowledge-Based Logistics Planning Shell (KBLPS) is a state-of-the-art DSS with an interactive map-oriented graphics user interface and powerful underlying planning algorithms. KBLPS was designed and implemented to support skilled Army logisticians to prepare and evaluate logistics plans rapidly, in order to support corps-level battle scenarios. KBLPS represents a substantial advance in graphical interactive planning tools, with the inclusion of intelligent planning algorithms that provide a powerful adjunct to the planning skills of commodity distribution planners. Retrieving specific information from large amounts of documentation is not an easy task. It could be facilitated if information relevant in the current problem solving context could be automatically supplied to the user. As a first step towards this goal, we have developed an intelligent hypertext system called CID (Computer Integrated Documentation). Besides providing an hypertext interface for browsing large documents, the CID system automatically acquires and reuses the context in which previous searches were appropriate. This mechanism utilizes on-line user information requirements and relevance feedback either to reinforce current indexing in case of success or to generate new knowledge in case of failure. Thus, the user continually augments and refines the intelligence of the retrieval system. This allows the CID system to provide helpful responses, based on previous usage of the documentation, and to improve its performance over time. We successfully tested the CID system with users of the Space Station Freedom requirements documents. We are currently extending CID to other application domains (Space Shuttle operations documents, airplane maintenance manuals, and on-line training). We are also exploring the potential commercialization of this technique. Author (revised)

COMMON MODELING SYSTEM FOR DIGITAL SIMULATION **c61**
Rick Painter *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 65-79 (For primary document see N94-32420 09-99)
Avail: CASI HC A03/MF A04

The Joint Modeling and Simulation System is a tri-service investigation into a common modeling framework for the development digital models. The basis for the success of this framework is an X-window-based, open systems architecture, object-based/oriented methodology, standard interface approach to digital model construction, configuration, execution, and post processing. For years Department of Defense (DOD) agencies have produced various weapon systems/technologies and typically digital representations of the systems/technologies. These digital representations (models) have also been developed for other reasons such as studies and analysis, Cost Effectiveness Analysis (COEA) tradeoffs, etc. Unfortunately, there have been no Modeling and Simulation (M&S) standards, guidelines, or efforts towards commonality in DOD M&S. The typical scenario is an organization hires a contractor to build hardware and in doing so an digital model may be constructed. Until recently, this model was not even obtained by the organization. Even if it was procured, it was on a unique platform, in a unique language, with unique interfaces, and, with the result being UNIQUE maintenance required. Additionally, the constructors of the model expended more effort in writing the 'infrastructure' of the model/simulation (e.g., user interface, database/database management system, data journalizing/archiving, graphical presentations, environment characteristics, other components in the simulation, etc.) than in producing the model of

the desired system. Other side effects include: duplication of efforts; varying assumptions; lack of credibility/validation; and decentralization in policy and execution. J-MASS provides the infrastructure, standards, toolset, and architecture to permit M&S developers and analysts to concentrate on the their area of interest. Author (revised)

ANALYTICAL DESIGN PACKAGE (ADP2): A COMPUTER AIDED ENGINEERING TOOL FOR AIRCRAFT TRANSPARENCY DESIGN **c61**
J. E. Wuerer, M. Gran, and T. W. Held *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 80-92 (For primary document see N94-32420 09-99)
Avail: CASI HC A03/MF A04

The Analytical Design Package (ADP2) is being developed as a part of the Air Force Frameless Transparency Program (FTP). ADP2 is an integrated design tool consisting of existing analysis codes and Computer Aided Engineering (CAE) software. The objective of the ADP2 is to develop and confirm an integrated design methodology for frameless transparencies, related aircraft interfaces, and their corresponding tooling. The application of this methodology will generate high confidence for achieving a qualified part prior to mold fabrication. ADP2 is a customized integration of analysis codes, CAE software, and material databases. The primary CAE integration tool for the ADP2 is P3/PATRAN, a commercial-off-the-shelf (COTS) software tool. The open architecture of P3/PATRAN allows customized installations with different applications modules for specific site requirements. Integration of material databases allows the engineer to select a material, and those material properties are automatically called into the relevant analysis code. The ADP2 materials database will be composed of four independent schemas: CAE Design, Processing, Testing, and Logistics Support. The design of ADP2 places major emphasis on the seamless integration of CAE and analysis modules with a single intuitive graphical interface. This tool is being designed to serve and be used by an entire project team, i.e., analysts, designers, materials experts, and managers. The final version of the software will be delivered to the Air Force in Jan. 1994. The Analytical Design Package (ADP2) will then be ready for transfer to industry. The package will be capable of a wide range of design and manufacturing applications. Author (revised)

ASSEMBLY FLOW SIMULATION OF A RADAR **c61**
W. C. Rutherford and P. M. Biggs *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 93-96 (For primary document see N94-32420 09-99)
(Contract DE-AC04-76DP-00613)
Avail: CASI HC A01/MF A04

A discrete event simulation model has been developed to predict the assembly flow time of a new radar product. The simulation was the key tool employed to identify flow constraints. The radar, production facility, and equipment complement were designed, arranged, and selected to provide the most manufacturable assembly possible. A goal was to reduce the assembly and testing cycle time from twenty-six weeks. A computer software simulation package (SLAM 2) was utilized as the foundation for simulating the assembly flow time. FORTRAN subroutines were incorporated into the software to deal with unique flow circumstances that were not accommodated by the software. Detailed information relating to the assembly operations was provided by a team selected from the engineering, manufacturing management, inspection, and production assembly staff. The simulation verified that it would be possible to achieve the cycle time goal of six weeks. Equipment and manpower constraints were identified during the simulation process and adjusted as required to achieve the flow with a given monthly production requirement. The simulation is being maintained as a planning tool to be used to identify constraints in the event that monthly output is increased. 'What-if' studies have been conducted to identify the cost of reducing constraints caused by increases in output requirement. Author

This article discusses CONFIG 3, a prototype software tool that supports integrated conceptual design evaluation from early in the product life cycle, by supporting isolated or integrated modeling, simulation, and analysis of the function, structure, behavior, failures and operations of system designs. Integration and reuse of models is supported in an object-oriented environment providing capabilities for graph analysis and discrete event simulation. CONFIG supports integration among diverse modeling approaches (component view, configuration or flow path view, and procedure view) and diverse simulation and analysis approaches. CONFIG is designed to support integrated engineering in diverse design domains, including mechanical and electro-mechanical systems, distributed computer systems, and chemical processing and transport systems. Avail: CASI HC A02/MF A04

The Jet Propulsion Laboratory is the Technical Monitor on an SBIR Program issued for Irvine Sensors Corporation to develop a highly compact, dual use massively parallel processing node known as SOBIEC. SOBIEC couples 3D memory stacking technology provided by nCUBE. The node contains sufficient network Input/Output to implement up to an order-13 binary hypercube. The benefit of this network, is that it scales linearly as more processors are added, and it is a superset of other commonly used interconnect topologies such as: meshes, rings, toroids, and trees. In this manner, a distributed processing network can be easily devised and supported. The SOBIEC node has sufficient memory for most multi-computer applications, and also supports external memory expansion and DMA interfaces. The SOBIEC node is supported by a mature set of software development tools from nCUBE. The nCUBE operating system (OS) provides configuration and operational support for up to 8000 SOBIEC processors in an order-13 binary hypercube or any subset or partition(s) thereof. The OS is UNIX (USL SVR4) compatible, with C, C++, and FORTRAN compilers readily available. A stand-alone development system is also available to support SOBIEC test and integration. Author

The National Space Transportation System (NSTS) is comprised of many diverse and highly complex systems incorporating the latest technologies. Data collection associated with ground processing of the various Space Shuttle system elements is extremely challenging due to the many separate processing locations where data is generated. This presents a significant problem when the timely collection, transfer, collation, and storage of data is required. This paper describes how new technology, referred to as Pen-Based computers, is being used to transform the data collection process at Kennedy Space Center (KSC). Pen-Based computers have streamlined procedures, increased data accuracy, and now provide more complete information than previous methods. The end results is the elimination of Shuttle processing delays associated with data deficiencies. Author

Avail: CASI HC A02/MF A04

'THE VERTICAL' computer keyboard is designed to address critical factors which contribute to Repetitive Motion Injuries (RMI) (including Carpal Tunnel Syndrome) in association with computer keyboard usage. This keyboard splits the standard QWERTY design into two halves and positions each half 90 degrees from the desk. In order to access a computer correctly. 'THE VERTICAL' requires users to position their bodies in optimal alignment with the keyboard. The orthopaedically neutral forearm position (with hands palms-in and thumbs-up) reduces nerve compression in the forearm. The vertically arranged keypad halves ameliorate onset occurrence of keyboard-associated RMI. By utilizing visually-reference mirrored mylar surfaces adjustable to the user's eye, the user is able to readily reference any key indicia (reversed) just as they would on a conventional keyboard. Transverse adjustability substantially reduces cumulative musculoskeletal discomfort in the shoulders. 'THE VERTICAL' eliminates the need for an exterior mouse by offering a convenient finger-accessible curser control while the hands remain in the vertically neutral position. The potential commercial application for 'THE VERTICAL' is enormous since the product can effect every person who uses a computer anywhere in the world. Employers and their insurance carriers are spending hundreds of millions of dollars per year as a result of RMI. This keyboard will reduce the risk.

A SYSTEMS APPROACH TO COMPUTER-BASED TRAINING **c61**
Gaylen W. Drape *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 130-136 (For primary document see N94-32420 09-99)
Avail: CASI HC A02/MF A04

This paper describes the hardware and software systems approach used in the Automated Recertification Training System (ARTS), a Phase 2 Small Business Innovation Research (SBIR) project for NASA Kennedy Space Center (KSC). The goal of this project is to optimize recertification training of technicians who process the Space Shuttle before launch by providing computer-based training courseware. The objectives of ARTS are to implement more effective CBT applications identified through a need assessment process and to provide an enhanced courseware production system. The system's capabilities are demonstrated by using five different pilot applications to convert existing classroom courses into interactive courseware. When the system is fully implemented at NASA/KSC, trainee job performance will improve and the cost of courseware development will be lower. Commercialization of the technology developed as part of this SBIR project is planned for Phase 3. Anticipated spin-off products include custom courseware for technical skills training and courseware production software for use by corporate training organizations of aerospace and other industrial companies.

The Machine Aided Voice Translation (MAVT) system was developed in response to the shortage of experienced military field interrogators with both foreign language proficiency and interrogation skills. Combining speech recognition, machine translation, and speech generation technologies, the MAVT accepts an interrogator's spoken English question and translates it into spoken Spanish. The spoken Spanish response of the potential informant can then be translated into spoken English. Potential military and civilian applications for automatic spoken language translation technology are discussed in this paper.

A PC PROGRAM TO OPTIMIZE SYSTEM CONFIGURATION FOR DESIRED RELIABILITY AT MINIMUM COST **c61**
Steven W. Hills and Ali S. Siahpush *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 143-150 (For primary document see N94-32420 09-99)
Avail: CASI HC A02/MF A04

High reliability is desired in all engineered systems. One way to improve system reliability is to use redundant components. When redundant components are used, the problem becomes one of allocating them to achieve the best reliability without exceeding other design constraints such as cost, weight, or volume. Systems with few components can be optimized by simply examining every possible combination but the number of combinations for most systems is prohibitive. A computerized iteration of the process is possible but anything short of a super computer requires too much time to be practical. Many researchers have derived mathematical formulations for calculating the optimum configuration directly. However, most of the derivations are based on continuous functions whereas the real system is composed of discrete entities. Therefore, these techniques are approximations of the true optimum solution. This paper describes a computer program that will determine the optimum configuration of a system of multiple redundancy of both standard and optional components. The algorithm is a pair-wise comparative progression technique which can derive the true optimum by calculating only a small fraction of the total number of combinations. A designer can quickly analyze a system with this program on a personal computer.

EVOLVING SOFTWARE REENGINEERING TECHNOLOGY FOR THE EMERGING INNOVATIVE-COMPETITIVE ERA **c61**
Phillip Q. Hwang, Evan Lock, and Noah Prywes *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 151-160 (For primary document see N94-32420 09-99)
Avail: CASI HC A02/MF A04

This paper reports on a multi-tool commercial/military environment combining software Domain Analysis techniques with Reusable Software and Reengineering of Legacy Software. It is based on the development of a military version for the Department of Defense (DOD). The integrated tools in the military version are: Software Specification Assistant (SSA) and Software Reengineering Environment (SRE), developed by Computer Command and Control Company (CCCC) for Naval Surface Warfare Center (NSWC) and Joint Logistics Commanders (JLC), and the Advanced Research Project Agency (ARPA) STARS Software Engineering Environment (SEE) developed by Boeing for NAVAIR PMA 205. The paper describes transitioning these integrated tools to commercial use. There is a critical need for the transition for the following reasons: First, to date, 70 percent of programmers' time is applied to software maintenance. The work of these users has not been facilitated by existing tools. The addition of Software Reengineering will also facilitate software maintenance and upgrading. In fact, the integrated tools will support the entire software life cycle. Second, the integrated tools are essential to Business Process Reengineering, which seeks radical process innovations to achieve breakthrough results. Done well, process reengineering delivers extraordinary gains in process speed, productivity and profitability. Most importantly, it discovers new opportunities for products and services in collaboration with other organizations. Legacy computer software must be changed rapidly to support innovative business processes. The integrated tools will provide commercial organizations important competitive advantages. This, in turn, will increase employment by creating new business opportunities. Third, the integrated system will produce much higher quality software than use of the tools separately. The reason for this is that producing or upgrading software requires keen understanding of extremely complex applications which is facilitated by the integrated tools. The radical savings in the time and cost associated with software, due to use of CASE tools that support combined Reuse of Software and Reengineering of Legacy Code, will add an important impetus to improving the automation of enterprises. This will be reflected in continuing operations, as well as in innovating new business processes. The proposed multi-tool software development is based on state of the art technology, which will be further advanced through the use of open systems for adding new tools and experience in their use.

Avail: CASI HC A02/MF A04

Parallel or distributed processing is key to getting highest performance workstations. However, designing and implementing efficient parallel algorithms is difficult and error-prone. It is even more difficult to write code that is both portable to and efficient on many different computers. Finally, it is harder still to satisfy the above requirements and include the reliability and ease of use required of commercial software intended for use in a production environment. As a result, the application of parallel processing technology to commercial software has been extremely small even though there are numerous computationally demanding programs that would significantly benefit from application of parallel processing. This paper describes DSSLIB, which is a library of subroutines that perform many of the time-consuming computations in engineering and scientific software. DSSLIB combines the high efficiency and speed of parallel computation with a serial programming model that eliminates many undesirable side-effects of typical parallel code. The result is a simple way to incorporate the power of parallel processing into commercial software without compromising maintainability, reliability, or ease of use. This gives significant advantages over less powerful non-parallel entries in the market. Author

HIGH-SPEED DATA SEARCH c82
James N. Driscoll *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 171-180 (For primary document see N94-32420 09-99)
Avail: CASI HC A02/MF A04

The high-speed data search system developed for KSC incorporates existing and emerging information retrieval technology to help a user intelligently and rapidly locate information found in large textual databases. This technology includes: natural language input; statistical ranking of retrieved information; an artificial intelligence concept called semantics, where 'surface level' knowledge found in text is used to improve the ranking of retrieved information; and relevance feedback, where user judgements about viewed information are used to automatically modify the search for further information. Semantics and relevance feedback are features of the system which are not available commercially. The system further demonstrates focus on paragraphs of information to decide relevance; and it can be used (without modification) to intelligently search all kinds of document collections, such as collections of legal documents medical documents, news stories, patents, and so forth. The purpose of this paper is to demonstrate the usefulness of statistical ranking, our semantic improvement, and relevance feedback. Author

DATABASE TOMOGRAPHY FOR COMMERCIAL APPLICATION c82
Ronald N. Kostoff and Henry J. Eberhart *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 181-189 (For primary document see N94-32420 09-99)
Avail: CASI HC A02/MF A04

Database tomography is a method for extracting themes and their relationships from text. The algorithms, employed begin with word frequency and word proximity analysis and build upon these results. When the word 'database' is used, think of medical or police records, patents, journals, or papers, etc. (any text information that can be computer stored). Database tomography features a full text, user interactive technique enabling the user to identify areas of interest, establish relationships, and map trends for a deeper understanding of an area of interest. Database tomography concepts and applications have been reported in journals and presented at conferences. One important feature of the database tomography algorithm is that it can be used on a database of any size, and will facilitate the users ability to understand the volume of content therein. While employing the process to identify research opportunities it became obvious that this promising technology has potential applications for business, science, engineering, law, and academe. Examples include evaluating marketing trends, strategies, relationships and associations. Also, the database tomography process would be a powerful component in the area of competitive intelligence, national security intelligence and patent analysis. User interests and involvement cannot be overemphasized.

AUTOMATED MAINFRAME DATA COLLECTION IN A NETWORK ENVIRONMENT c82
David L. Gross *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 190-197 (For primary document see N94-32420 09-99)
Avail: CASI HC A02/MF A04

The progress and direction of the computer industry have resulted in widespread use of dissimilar and incompatible mainframe data systems. Data collection from these multiple systems is a labor intensive task. In the past, data collection had been restricted to the efforts of personnel specially trained on each system. Information is one of the most important resources an organizations has. Any improvement in an organization's ability to access and manage that information provides a competitive advantage. This problem of data collection is compounded at NASA sites by multi-center and contractor operations. The Centralized Automated Data Retrieval System (CADRS) is designed to provide a common interface that would permit data access, query, and retrieval from multiple contractor and NASA systems. The methods developed for CADRS have a strong commercial potential in that they would be applicable for any industry that needs inter-department, inter-company, or inter-agency data communications. The widespread use of multi-system data networks, that combine older legacy systems with newer decentralized networks, has made data retrieval a critical problem for information dependent industries. Implementing the technology discussed in this paper would reduce operational expense and improve data collection on these composite data systems. Author

Under the direction of the NASA George C. Marshall Space Flight Center, Huntsville, Alabama, the development and commercialization of an advanced Automated Parts Indentification (API) system is being undertaken by Rockwell International Corporation. The new API system is based on a variable sized, machine-readable, two-dimensioanl matrix symbol that can be applied directly onto most metallic and nonmetallic materials using safe, permanent marking methods. Its checkerboard-like structure is the most space efficient of all symbologies. This high data-density symbology can be applied to products of different material sizes and geometries using application-dependent, computer-driven marking devices. The high fidelity markings produced by these devices can then be captured using a specially designed camera linked to any IBM-compatible computer. Applications of compressed symbology technology will reduce costs and improve quality, productivity, and processes in a wide variety of federal and commercial applications. Author

OPTICAL PROCESSING FOR SEMICONDUCTOR DEVICE FABRICATION c74
Bhushan L. Sopori *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 207-215 (For primary document see N94-32420 09-99)
Avail: CASI HC A02/MF A04

A new technique for semiconductor device processing is described that uses optical energy to produce local heating/melting in the vicinity of a preselected interface of the device. This process, called optical processing, invokes assistance of photons to enhance interface reactions such as diffusion and melting, as compared to the use of thermal heating alone. Optical processing is performed in a 'cold wall' furnace, and requires considerably lower energies than furnace or rapid thermal annealing. This technique can produce some device structures with unique properties that cannot be produced by conventional thermal processing. Some applications

of optical processing involving semiconductor-metal interfaces are described. Author

A SCANNING DEFECT MAPPING SYSTEM FOR SEMICONDUCTOR CHARACTERIZATION c74
Bushnan L. Sopori *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 216-222 (For primary document see N94-32420 09-99)
Avail: CASI HC A02/MF A04

We have developed an optical scanning system that generates maps of the spatial distributions of defects in single and polycrystalline silicon wafers. This instrument, called Scanning Defect Mapping System, utilizes differences in the scattering characteristics of dislocation etch pits and grain boundaries from a defect-etched sample to identify and count them. This system simultaneously operates in the dislocation mode and the grain boundary (GB) mode. In the 'dislocation mode,' the optical scattering from the etch pits is used to statistically count dislocations, while ignoring the GB's. Likewise, in the 'grain boundary mode' the system only recognizes the local scattering from the GB's to generate grain boundary distributions. The information generated by this instrument is valuable for material quality control, identifying mechanisms of defect generation and the nature of thermal stresses during the crystal growth, and the solar cell process design. NEUTRAL ION SOURCES IN PRECISION MANUFACTURING c72
Steven C. Fawcett and Thomas W. Drueding *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 223-232 (For primary document see N94-32420 09-99)
Avail: CASI HC A02/MF A04

Ion figuring of optical components is a relatively new technology that can alleviate some of the problems associated with traditional contact polishing. Because the technique is non contacting, edge distortions and rib structure print through do not occur. This initial investigation was aimed at determining the effect of ion figuring on surface roughness of previously polished or ductile ground ceramic optical samples. This is the first step in research directed toward the combination of a pre-finishing process (ductile grinding or polishing) with ion figuring to produce finished ceramic mirrors. The second phase of the project is focusing on the development of mathematical algorithms that will deconvolve the ion beam profile from the surface figure errors so that these errors can be successfully removed from the optical components. In the initial phase of the project, multiple, chemical vapor deposited silicon carbide (CVD SiC) samples were polished or ductile ground to specular or near-specular roughness. These samples were then characterized to determine topographic surface information. The surface evaluation consisted of stylus profilometry, interferometry, and optical and scanning electron microscopy. The surfaces, were ion machined to depths from 0-5 microns. The finished surfaces were characterized to evaluate the effects of the ion machining process with respect to the previous processing methods and the pre-existing subsurface damage. The development of the control algorithms for figuring optical components has been completed. These algorithms have been validated with simulations and future experiments have been planned to verify the methods. This paper will present the results of the initial surface finish experiments and the control algorithms simulations. Author

HIGH POWER DIODE LASERS FOR SOLID-STATE LASER PUMPS c36
Kurt J. Linden and Patrick N. McDonnell *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 233-245 (For primary document see N94-32420 09-99)
(Contracts NAS1-18660; NAS1-19301)
Avail: CASI HC A03/MF A04

The development and commercial application of high power diode laser arrays for use as solid-state laser pumps is described. Such solid-state laser pumps are significantly more efficient and reliable than conventional flash-lamps. This paper describes the design and fabrication of diode lasers emitting in the 780 - 900 nm spectral region, and discusses their performance and reliability. Typical measured performance parameters include electrical-to-optical power conversion efficiencies of 50 percent, narrow-band spectral emission of 2 to 3 nm FWHM, pulsed output power levels of 50 watts/bar with reliability values of over 2 billion shots to date (tests to be terminated after 10 billion shots), and reliable operation to pulse lengths of 1 ms. Pulse lengths up to 5 ms have been demonstrated at derated power levels, and CW performance at various power levels has been evaluated in a 'bar-in-groove' laser package. These high-power 1-cm stacked-bar arrays are now being manufactured for OEM use. Individual diode laser bars, ready for package-mounting by OEM customers, are being sold as commodity items. Commercial and medical applications of these laser arrays include solid-state laser pumping for metal-working, cutting, industrial measurement and control, ranging, wind-shear/atmospheric turbulence detection, X-ray generation, materials surface cleaning, microsurgery, ophthalmology, dermatology, and dental procedures. FLEXIBLE MANUFACTURING FOR PHOTONICS DEVICE ASSEMBLY c31
Shin-yee Lu, Michael D. Pocha, Oliver T. Strand, and K. David Young *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 246-251 (For primary document see N94-32420 09-99)
(Contract W-745-eng-48)
Avail: CASI HC A02/MF A04

The assembly of photonics devices such as laser diodes, optical modulators, and opto-electronics multi-chip modules (OEMCM), usually requires the placement of micron size devices such as laser diodes, and sub-micron precision attachment between optical fibers and diodes or waveguide modulators (usually referred to as pigtailing). This is a very labor intensive process. Studies done by the opto-electronics (OE) industry have shown that 95 percent of the cost of a pigtailed photonic device is due to the use of manual alignment and bonding techniques, which is the current practice in industry. At Lawrence Livermore National Laboratory, we are working to reduce the cost of packaging OE devices through the use of automation. Our efforts are concentrated on several areas that are directly related to an automated process. This paper will focus on our progress in two of those areas, in particular, an automated fiber pigtailing machine and silicon micro-technology compatible with an automated process. Author

APPLICATION OF DEXTEROUS SPACE ROBOTICS TECHNOLOGY TO MYOELECTRIC PROSTHESES c37
Clifford Hess, Larry C. H. Li, Kristin A. Farry, and Ian D. Walker *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 255-268 (For primary document see N94-32420 09-99)
Avail: CASI HC A03/MF A04

Future space missions will require robots equipped with highly dexterous robotic hands to perform a variety of tasks. A major technical challenge in making this possible is an improvement in the way these dexterous robotic hands are remotely controlled or teleoperated. NASA is currently investigating the feasibility of using myoelectric signals to teleoperate a dexterous robotic hand. In theory, myoelectric control of robotic hands will require little or no mechanical parts and will greatly reduce the bulk and weight usually found in dexterous robotic hand control devices. An improvement in myoelectric control of multifinger hands will also benefit prosthetics users. Therefore, as an effort to transfer dexterous space robotics technology to prosthetics applications and to benefit from existing myoelectric technology, NASA is collaborating with the Limbs of Love Foundation, the Institute for Rehabilitation and Research, and Rice University in developing improved myoelectric control multifinger hands and prostheses. In this paper, we will address the objectives and approaches of this collaborative effort and discuss the technical issues associated with myoelectric control of multifinger hands. We will also report our current progress and discuss plans for future work. Author

NAVY OMNI-DIRECTIONAL VEHICLE (ODV) DEVELOPMENT PROGRAM c37

Hillery McGowen *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 269-278 (For primary document see N94-32420 09-99)
Avail: CASI HC A02/MF A04

The Omni-Directional Vehicle (ODV) development program sponsored by the Office of Naval Research at the Coastal Systems Station has investigated the application of ODV technology for use in the Navy shipboard environment. ODV technology as originally received by the Navy in the form of the Cadillac-Gage Side Mover Vehicle was applicable to the shipboard environment with the potential to overcome conditions of reduced traction, ship motion, decks heeled at high angles, obstacles, and confined spaces. Under the Navy program, ODV technology was investigated and a series of experimental vehicles were built and successfully tested under extremely demanding conditions. The ODV drive system has been found to be applicable to autonomous, remotely, or manually operated vehicles. Potential commercial applications include multi-directional forklift trucks, automatic guided vehicles employed in manufacturing environments, and remotely controlled platforms used in nuclear facilities or for hazardous waste clean up tasks. APPLYING ROBOTICS TO HAZMAT **c37**
Richard V. Welch and Gary O. Edmonds *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 279-287 (For primary document see N94-32420 09-99)
Avail: CASI HC A02/MF A04

The use of robotics in situations involving hazardous materials can significantly reduce the risk of human injuries. The Emergency Response Robotics Project, which began in October 1990 at the Jet Propulsion Laboratory, is developing a teleoperated mobile robot allowing HAZMAT (hazardous materials) teams to remotely respond to incidents involving hazardous materials. The current robot, called HAZBOT III, can assist in locating characterizing, identifying, and mitigating hazardous material incidents without risking entry team personnel. The active involvement of the JPL Fire Department HAZMAT team has been vital in developing a robotic system which enables them to perform remote reconnaissance of a HAZMAT incident site. This paper provides a brief review of the history of the project, discusses the current system in detail, and presents other areas in which robotics can be applied removing people from hazardous environments/operations. ADVANCED TELEOPERATION: TECHNOLOGY INNOVATIONS AND APPLICATIONS **c54**
Paul S. Schenker, Antal K. Bejczy, and Won S. Kim *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 288-292 (For primary document see N94-32420 09-99)
Avail: CASI HC A01/MF A04

The capability to remotely, robotically perform space assembly, inspection, servicing, and science functions would rapidly expand our presence in space, and the cost efficiency of being there. There is considerable interest in developing 'telerobotic' technologies, which also have comparably important terrestrial applications to health care, underwater salvage, nuclear waste remediation and other. Such tasks, both space and terrestrial, require both a robot and operator interface that is highly flexible and adaptive, i.e., capable of efficiently working in changing and often casually structured environments. One systems approach to this requirement is to augment traditional teleoperation with computer assists -- advanced teleoperation. We have spent a number of years pursuing this approach, and highlight some key technology developments and their potential commercial impact. This paper is an illustrative summary rather than self-contained presentation; for completeness, we include representative technical references to our work which will allow the reader to follow up items of particular interest. CONTINUOUS MEASUREMENT OF AIRCRAFT WING ICING **c03**
Stephen S. C. Yao *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 295-300 (For primary document see N94-32420 09-99)
Avail: CASI HC A02/MF A04

Ice formation on the wings of aircraft is a problem that has plagued air travel since its inception. Several recent incidents have been attributed to ice formation on the lifting surfaces of wings. This paper describes a SBIR Phase 1 research effort on the use of small flat dielectric sensors in detecting a layer of ice above the sensor. The sensors are very small, lightweight, and inexpensive. The electronics package that controls the sensor is also small, and could be even smaller using commonly available miniaturization technologies. Thus, several sensors could be placed on a surface such that a representative ice thickness profile could be measured. The benefits offered by developing this technology go beyond the safety improvements realized by monitoring ice formation on the wings of an aircraft. Continuous monitoring of anti-icing fluid concentrations on the ground would warn the pilot of impending fluid failure as well as allowing the stations to use less de-icing solution per aircraft. This in turn would increase the safety of takeoffs and reduce the overall discharge of de-icing solution into the environment, thus reducing the biohazard of the de-icing procedure. Author

ELECTROMAGNETIC PROBE TECHNIQUE FOR FLUID FLOW MEASUREMENTS **c34**
G. D. Arndt and J. R. Carl *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 301-310 (For primary document see N94-32420 09-99)
Avail: CASI HC A02/MF A04

The probes described herein, in various configurations, permit the measurement of the volume fraction of two or more fluids flowing through a pipe. Each probe measures the instantaneous relative dielectric constant of the fluid in immediate proximity. As long as separation of the relative dielectric constant of the fluid is possible, several or even many fluids can be measured in the same flow stream. By using multiple probes, the velocity of each fluid can generally be determined as well as the distribution of each constituent in the pipe. The values are determined by statistical computation. There are many potential applications for probes of this type in industry and government. Possible NASA applications include measurements of helium/hydrazine flow during rocket tests at White Sands, liquid/gas flow in hydrogen or oxygen lines in Orbiter engines, and liquid/gaseous Freon flow in zero gravity tests with the KS135 aircraft at JSC. Much interest has been shown recently by the oil industry. In this a good method is needed to measure the fractions of oil, water, and natural gas flowing in a pipeline and the velocity of each. This particular problem involves an extension of what has been developed to date and our plans to solve this problem will be discussed herein. Author

COMPUTERIZED ULTRASONIC TESTING SYSTEM (CUTS) FOR IN-PROCESS THICKNESS DETERMINATION **c71**
J. Frankel, M. Doxbeck, S. C. Schroeder, and A. Abbate *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 311-317 (For primary document see N94-32420 09-99)
Avail: CASI HC A02/MF A04

A Computerized Ultrasonic Testing System (CUTS) was developed to measure, in real-time, the rate of deposition and thickness of chromium plated on the inside of thick steel tubes. The measurements are made from the outside of the tubes with the ultrasonic pulse-echo technique. The resolution of the system is 2.5 micron. (0.0001 in.) and the accuracy is better than 10 micron (0.0004 in.). The thickness is measured using six transducers mounted at different locations on the tube. In addition, two transducers are mounted on two reference standards, thereby allowing the system to be continuously calibrated. The tube temperature varies during the process, thus the input from eight thermocouples, located at the measurement sites, is used to calculate and compensate for the change in return time of the ultrasonic echo due to the temperature dependence of the sound velocity. CUTS is applicable to any commercial process where real-time change of thickness of a sample has to be known, with

the advantage of facilitating increased efficiency and of improving process control. Author

MICROWAVE SENSOR FOR ICE DETECTION c06

G. D. Arndt, A. Chu, L. G. Stolarczyk, and G. L. Stolarczyk *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 318-325 (For primary document see N94-32420 09-99)

Avail: CASI HC A02/MF A04

A microwave technique has been developed for detecting ice build-up on the wing surfaces of commercial airliners and highway bridges. A microstrip patch antenna serves as the sensor, with changes in the resonant frequency and impedance being dependent upon the overlying layers of ice, water and glycol mixtures. The antenna sensor is conformably mounted on the wing. The depth and dielectric constants of the layers are measured by comparing the complex resonant admittance with a calibrated standard. An initial breadboard unit has been built and tested. Additional development is now underway. Another commercial application is in the robotics field of remote sensing of coal seam thickness. Author

A VERSATILE NONDESTRUCTIVE EVALUATION IMAGING WORKSTATION c38

E. James Chern and David W. Butler *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 326-331 (For primary document see N94-32420 09-99)

Avail: CASI HC A02/MF A04

Ultrasonic C-scan and eddy current imaging systems are of the pointwise type evaluation systems that rely on a mechanical scanner to physically maneuver a probe relative to the specimen point by point in order to acquire data and generate images. Since the ultrasonic C-scan and eddy current imaging systems are based on the same mechanical scanning mechanisms, the two systems can be combined using the same PC platform with a common mechanical manipulation subsystem and integrated data acquisition software. Based on this concept, we have developed an IBM PC-based combined ultrasonic C-scan and eddy current imaging system. The system is modularized and provides capacity for future hardware and software expansions. Advantages associated with the combined system are: (1) eliminated duplication of the computer and mechanical hardware, (2) unified data acquisition, processing and storage software, (3) reduced setup time for repetitious ultrasonic and eddy current scans, and (4) improved system efficiency. The concept can be adapted to many engineering systems by integrating related PC-based instruments into one multipurpose workstation such as dispensing, machining, packaging, sorting, and other industrial applications. Avail: CASI HC A02/MF A04

A multi-organizational team at the Goddard Space Flight Center is developing a new far infrared (FIR) camera system which furthers the state of the art for this type of instrument by the incorporating recent advances in several technological disciplines. All aspects of the camera system are optimized for operation at the high data rates required for astronomical observations in the far infrared. The instrument is built around a Blocked Impurity Band (BIB) detector array which exhibits responsivity over a broad wavelength band and which is capable of operating at 1000 frames/sec, and consists of a focal plane dewar, a compact camera head electronics package, and a Digital Signal Processor (DSP)-based data system residing in a standard 486 personal computer. In this paper we discuss the overall system architecture, the focal plane dewar, and advanced features and design considerations for the electronics. This system, or one derived from it, may prove useful for many commercial and/or industrial infrared imaging or spectroscopic applications, including thermal machine vision for robotic manufacturing, photographic observation of short-duration thermal events such as combustion or chemical reactions, and high-resolution surveillance imaging. UNIVERSAL SIGNAL CONDITIONING AMPLIFIER c33

Pedro J. Medelius (I-NET, Inc., Cocoa Beach, FL.), Carl Hallberg (I-NET, Inc., Cocoa Beach, FL.), and Jim Cecil *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 342-348 (For primary document see N94-32420 09-99)

Avail: CASI HC A02/MF A04

A state-of-the-art instrumentation amplifier capable of being used with most types of transducers has been developed at the Kennedy Space Center. This Universal Signal Conditioning Amplifier (USCA) can eliminate costly measurement setup item and troubleshooting, improve system reliability and provide more accurate data than conventional amplifiers. The USCA can configure itself for maximum resolution and accuracy based on information read from a RAM chip attached to each transducer. Excitation voltages or current are also automatically configured. The amplifier uses both analog and digital state-of-the-art technology with analog-to-digital conversion performed in the early stages in order to minimize errors introduced by offset and gain drifts in the analog components. A dynamic temperature compensation scheme has been designed to achieve and maintain 12-bit accuracy of the amplifier from 0 to 70 C. The digital signal processing section allows the implementation of digital filters up to 511th order. The amplifier can also perform real-time linearizations up to fourth order while processing data at a rate of 23.438 kS/s. Both digital and analog outputs are available from the amplifier. Author

THE CONSTANT CURRENT LOOP: A NEW PARADIGM FOR RESISTANCE SIGNAL CONDITIONING c32

Karl F. Anderson *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 349-361 (For primary document see N94-32420 09-99)

Avail: CASI HC A03/MF A04

A practical single constant current loop circuit for the signal conditioning of variable-resistance transducers has been synthesized, analyzed, and demonstrated. The strain gage and the resistance temperature detector are examples of variable-resistance sensors. Lead wires connect variable-resistance sensors to remotely located signal-conditioning hardware. The presence of lead wires in the conventional Wheatstone bridge signal-conditioning circuit introduces undesired effects that reduce the quality of the data from the remote sensors. A practical approach is presented for suppressing essentially all lead wire resistance effects while indicating only the change in resistance value. Theoretical predictions supported by laboratory testing confirm the following features of the approach: (1) dc response; (2) the electrical output is unaffected by extremely large variation in the resistance of any or all lead wires; (3) the electrical output remains zero for no change in gage resistance; (4) the electrical output is inherently linear with respect to gage resistance change; (5) the sensitivity is double that of a Wheatstone bridge circuit; and (6) the same excitation wires can serve multiple independent gages. An adaptation of current loop circuit is presented that simultaneously provides an output signal voltage directly proportional to transducer resistance change and provides temperature information that is unaffected by transducer and lead wire resistance variations. These innovations are the subject of NASA patent applications. Author

An important part of NASA's mission involves the secondary application of its technologies in the public and private sectors. One current application under development is LiteraCity, a simulation-based instructional package for adults who do not have functional reading skills. Using fuzzy logic routines and other technologies developed by NASA's Information Systems Directorate and hypermedia sound, graphics, and animation technologies the project attempts to overcome the limited impact of adult literacy assessment and instruction by involving the adult in an interactive simulation of real-life literacy activities. The project uses a recursive instructional development model and authentic instruction theory. This paper describes one component of a project to design, develop, and produce a series of computer-based, multimedia instructional packages. The packages are being developed for use in adult literacy programs, particularly in correctional education centers. They use the concepts of authentic instruction and authentic assessment to guide development. All the packages to be developed are instructional simulations. The first is a simulation of 'finding a friend a job.' Author

Avail: CASI HC A03/MF A04

Environmental management, impact assessment, research and monitoring are multidisciplinary activities which are ideally suited to incorporate a multi-media approach to environmental problem solving. Geographic information systems (GIS), simulation models, neural networks and expert-system software are some of the advancing technologies being used for data management, query, analysis and display. At the 140,000 acre John F. Kennedy Space Center, the Advanced Software Technology group has been supporting development and implementation of a program that integrates these and other rapidly evolving hardware and software capabilities into a comprehensive Mapping, Analysis and Planning System (MAPS) based in a workstation/local are network environment. An expert-system shell is being developed to link the various databases to guide users through the numerous stages of a facility siting and environmental assessment. The expert-system shell approach is appealing for its ease of data access by management-level decision makers while maintaining the involvement of the data specialists. This, as well as increased efficiency and accuracy in data analysis and report preparation, can benefit any organization involved in natural resources management. Author

REMOTE SENSING FOR HURRICANE ANDREW IMPACT ASSESSMENT Abstract Only c43
Bruce A. Davis and Nicholas Schmidt *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 388 (For primary document see N94-32420 09-99)
Avail: CASI HC A01/MF A04

Stennis Space Center personnel flew a Learjet equipped with instrumentation designed to acquire imagery in many spectral bands into areas most damaged by Hurricane Andrew. The calibrated airborne multispectral scanner (CAMS), a NASA-developed sensor, and a Zeiss camera acquired images of these areas. The information derived from the imagery was used to assist Florida officials in assessing the devastation caused by the hurricane. The imagery provided the relief teams with an assessment of the debris covering roads and highways so cleanup plans could be prioritized. The imagery also mapped the level of damage in residential and commercial areas of southern Florida and provided maps of beaches and land cover for determination of beach loss and vegetation damage, particularly the mangrove population. Stennis Space Center personnel demonstrated the ability to respond quickly and the value of such response in an emergency situation. The digital imagery from the CAMS can be processed, analyzed, and developed into products for field crews faster than conventional photography. The resulting information is versatile and allows for rapid updating and editing. Stennis Space Center and state officials worked diligently to compile information to complete analyses of the hurricane's impact. Author (revised)

Utility companies are challenged to provide services to a highly dynamic customer base. With factory closures and shifts in employment becoming a routine occurrence, the utility industry must develop new techniques to maintain records and plan for expected growth. BellSouth Telecommunications, the largest of the Bell telephone companies, currently serves over 13 million residences and 2 million commercial customers. Tracking the movement of customers and scheduling the delivery of service are major tasks for BellSouth that require intensive manpower and sophisticated information management techniques. Through NASA's Commercial Remote Sensing Program Office, BellSouth is investigating the utility of remote sensing and geographic information system techniques to forecast residential development. This paper highlights the initial results of this project, which indicate a high correlation between the U.S. Bureau of Census block group statistics and statistics derived from remote sensing data. Since 1986, NASA's Commercial Remote Sensing Program (CRSP) at Stennis Space Center has supported commercial remote sensing partnerships with industry. CRSP's mission is to maximize U.S. market exploitation of remote sensing and related space-based technologies and to develop advanced technical solutions for spatial information requirements. Observation, geolocation, and communications technologies are converging and their integration is critical to realize the economic potential for spatial informational needs. Global positioning system (GPS) technology enables a virtual revolution in geopositionally accurate remote sensing of the earth. A majority of states are creating GPS-based reference networks, or high accuracy reference networks (HARN). A HARN can be defined for a variety of local applications and tied to aerial or satellite observations to provide an important contribution to geographic information systems (GIS). This paper details CRSP's experience in the design and implementation of a HARN in Mississippi and the design and support of future applications of integrated earth observations, geolocation, and communications technology. A VISUAL DETECTION MODEL FOR DCT COEFFICIENT QUANTIZATION c64
Albert J. Ahumada, Jr. and Andrew B. Watson *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference

and Exposition, Volume 2 Feb. 1994 p 404-415 (For primary document see N94-32420 09-99)
Avail: CASI HC A03/MF A04

The discrete cosine transform (DCT) is widely used in image compression and is part of the JPEG and MPEG compression standards. The degree of compression and the amount of distortion in the decompressed image are controlled by the quantization of the transform coefficients. The standards do not specify how the DCT coefficients should be quantized. One approach is to set the quantization level for each coefficient so that the quantization error is near the threshold of visibility. Results from previous work are combined to form the current best detection model for DCT coefficient quantization noise. This model predicts sensitivity as a function of display parameters, enabling quantization matrices to be designed for display situations varying in luminance, veiling light, and spatial frequency related conditions (pixel size, viewing distance, and aspect ratio). It also allows arbitrary color space directions for the representation of color. A model-based method of optimizing the quantization matrix for an individual image was developed. The model described above provides visual thresholds for each DCT frequency. These thresholds are adjusted within each block for visual light adaptation and contrast masking. For given quantization matrix, the DCT quantization errors are scaled by the adjusted thresholds to yield perceptual errors. These errors are pooled nonlinearly over the image to yield total perceptual error. With this model one may estimate the quantization matrix for a particular image that yields minimum bit rate for a given total perceptual error, or minimum perceptual error for a given bit rate. Custom matrices for a number of images show clear improvement over image-independent matrices. Custom matrices are compatible with the JPEG standard, which requires transmission of the quantization matrix. Author

VOICE AND VIDEO TRANSMISSION USING XTP AND FDDI **c32**
John Drummond, Edwin Cheng, and Will Gex *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 416-421 (For primary document see N94-32420 09-99)
Avail: CASI HC A02/MF A04

The use of Xpress Transfer Protocol (XTP) and Fiber Distributed Data Interface (FDDI) provides a high speed and high performance network solution to multimedia transmission that requires high bandwidth. FDDI is an ANSI and ISO standard for a MAC and physical layer protocol that provides a signaling rate of 100 Mbits/sec and fault tolerance. XTP is a transport and network layer protocol designed for high performance and efficiency and is the heart of the SAFENET Lightweight Suite for systems that require performance or realtime communications. The testbed consists of several commercially available Intel based i486 PC's containing off-the-shelf FDDI cards, audio analog-digital converter cards, video interface cards, and XTP software. Unicast, multicast, and duplex audio transmission experiments have been performed using XTP software. Unicast and multicast video transmission is in progress. Several potential commercial applications are described. Author (revised)

AN INTELLIGENT INTERACTIVE VISUAL DATABASE MANAGEMENT SYSTEM FOR SPACE SHUTTLE CLOSEOUT IMAGE MANAGEMENT **c82**
James M. Ragusa, Gary Orwig, Michael Gilliam, David Blacklock, and Ali Shaykhian *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 422-429 (For primary document see N94-32420 09-99)
(Grant NAG10-0058)
Avail: CASI HC A02/MF A04

Status is given of an applications investigation on the potential for using an expert system shell for classification and retrieval of high resolution, digital, color space shuttle closeout photography. This NASA funded activity has focused on the use of integrated information technologies to intelligently classify and retrieve still imagery from a large, electronically stored collection. A space shuttle processing problem is identified, a working prototype system is described, and commercial applications are identified. A conclusion reached is that the developed system has distinct advantages over the present manual system and cost efficiencies will result as the system is implemented. Further, commercial potential exists for this integrated technology. Author (revised)

THE TRUSTWORTHY DIGITAL CAMERA: RESTORING CREDIBILITY TO THE PHOTOGRAPHIC IMAGE **c35**
Gary L. Friedman *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 430-435 (For primary document see N94-32420 09-99)
Avail: CASI HC A02/MF A04

The increasing sophistication of computers has made digital manipulation of photographic images, as well as other digitally-recorded artifacts such as audio and video, incredibly easy to perform and increasingly difficult to detect. Today, every picture appearing in newspapers and magazines has been digitally altered to some degree, with the severity varying from the trivial (cleaning up 'noise' and removing distracting backgrounds) to the point of deception (articles of clothing removed, heads attached to other people's bodies, and the complete rearrangement of city skylines). As the power, flexibility, and ubiquity of image-altering computers continues to increase, the well-known adage that 'the photography doesn't lie' will continue to become an anachronism. A solution to this problem comes from a concept called digital signatures, which incorporates modern cryptographic techniques to authenticate electronic mail messages. 'Authenticate' in this case means one can be sure that the message has not been altered, and that the sender's identity has not been forged. The technique can serve not only to authenticate images, but also to help the photographer retain and enforce copyright protection when the concept of 'electronic original' is no longer meaningful. VIRTUAL REALITY IN MEDICAL EDUCATION AND ASSESSMENT **c52**
Laurie A. Sprague (LinCom Corp., Houston, TX.), Brad Bell (LinCom Corp., Houston, TX.), Tim Sullivan (LinCom Corp., Houston, TX.), Mark Voss (LinCom Corp., Houston, TX.), Andrew F. Payer (Texas Univ., Galveston.), and Stewart Michael Goza *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 439-443 (For primary document see N94-32420 09-99)
Avail: CASI HC A01/MF A04

The NASA Johnson Space Center (JSC)/LinCom Corporation, the University of Texas Medical Branch at Galveston (UTMB), and the Galveston Independent School District (GISD) have teamed up to develop a virtual visual environment display (VIVED) that provides a unique educational experience using virtual reality (VR) technologies. The VIVED end product will be a self-contained educational experience allowing students a new method of learning as they interact with the subject matter through VR. This type of interface is intuitive and utilizes spatial and psychomotor abilities which are now constrained or reduced by the current two dimensional terminals and keyboards. The perpetual challenge to educators remains the identification and development of methodologies which conform the learners abilities and preferences. The unique aspects of VR provide an opportunity to explore a new educational experience. Endowing medical students with an understanding of the human body poses some difficulty challenges. One of the most difficult is to convey the three dimensional nature of anatomical structures. The ideal environment for addressing this problem would be one that allows students to become small enough to enter the body and travel through it - much like a person walks through a building. By using VR technology, this effect can be achieved; when VR is combined with multimedia technologies, the effect can be spectacular.

TECHNOLOGY TRANSFER OF OPERATOR-IN-THE-LOOP SIMULATION **c53**
K. H. Yae (Iowa Univ., Iowa City.), H. C. Lin (Iowa Univ., Iowa City.), T. C. Lin (Iowa Univ., Iowa City.), and H. P. Frisch *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 444-455 (For primary document see N94-32420 09-99)
Avail: CASI HC A03/MF A04

The technology developed for operator-in-the-loop simulation in space teleoperation has been applied to Caterpillar's backhoe, wheel loader, and off-highway truck. On an SGI workstation, the simulation integrates computer modeling of kinematics and dynamics, real-time computational and visualization, and an interface with the operator through the operator's console. The console is interfaced with the workstation through an IBM-PC in which the operator's commands were digitized and sent through an RS-232 serial port. The simulation gave visual feedback adequate for the operator in the loop, with the camera's field of vision projected on a large screen in multiple view windows. The view control can emulate either stationary or moving cameras. This simulator created an innovative engineering design environment by integrating computer software and hardware with the human operator's interactions. The backhoe simulation has been adopted by Caterpillar in building a virtual reality tool for backhoe design. Author

HIGH PERFORMANCE REAL-TIME FLIGHT SIMULATION AT NASA LANGLEY **c09**

Jeff I. Cleveland, II *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 456-462 (For primary document see N94-32420 09-99)

Avail: CASI HC A02/MF A04

In order to meet the stringent time-critical requirements for real-time man-in-the-loop flight simulation, computer processing operations must be deterministic and be completed in as short a time as possible. This includes simulation mathematical model computational and data input/output to the simulators. In 1986, in response to increased demands for flight simulation performance, personnel at NASA's Langley Research Center (LaRC), working with the contractor, developed extensions to a standard input/output system to provide for high bandwidth, low latency data acquisition and distribution. The Computer Automated Measurement and Control technology (IEEE standard 595) was extended to meet the performance requirements for real-time simulation. This technology extension increased the effective bandwidth by a factor of ten and increased the performance of modules necessary for simulator communications. This technology is being used by more than 80 leading technological developers in the United States, Canada, and Europe. Included among the commercial applications of this technology are nuclear process control, power grid analysis, process monitoring, real-time simulation, and radar data acquisition. Personnel at LaRC have completed the development of the use of supercomputers for simulation mathematical model computational to support real-time flight simulation. This includes the development of a real-time operating system and the development of specialized software and hardware for the CAMAC simulator network. This work, coupled with the use of an open systems software architecture, has advanced the state of the art in real time flight simulation. The data acquisition technology innovation and experience with recent developments in this technology are described. Author (revised)

THE EFFECTS OF ABOVE REAL-TIME TRAINING (ARTT) IN AN F-16 SIMULATOR **c09**

Dutch Guckenberger, Kay Stanney, and Norman E. Lane *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 2 Feb. 1994 p 463-470 (For primary document see N94-32420 09-99)

Avail: CASI HC A02/MF A04

In this application of above real-time training (ARTT), 24 mission-capable F-16 pilots performed three tasks on a part-task F-16A flight simulator under varying levels of time compression (i.e., 1.0x, 1.5x, 2.0x, and random). All subjects were then tested in a real-time (1.0x) environment. The three tasks under study were an emergency procedure (EP) task, a one versus two air combat maneuvering (ACM) task, and a stern conversion or air intercept task. All ARTT pilots performed the EP task with 28 percent greater accuracy and were better at dealing with a simultaneous MIG threat, reflected by a six-fold increase in the number of MIG kills compared to a real-time control group. In the stern conversion task, there were no statistical differences between groups. In the ACM task, those pilots trained in the mixed time accelerations were faster to acquire lock and were faster to kill both MIG threats than the other groups. These findings are generally consistent with previous findings that show positive effects of task variations (including time variations) during training. Also discussed are related research findings that support the benefits of ARTT and ARTT's impact on emergency procedure training. Further, a synthesis of multidiscipline research outlining the underlying theoretical basis for ARTT is presented. A proposed model of ARTT based on an analogy to Einstein's theory of special relativity is suggested. Conclusions and an outline of future research directions are presented. Successful current commercialization efforts are related as well as future efforts. Author (revised)

AERONAUTICS AND SPACE REPORT OF THE PRESIDENT: FISCAL YEAR 1993 ACTIVITIES

1994 136 p Original contains color illustrations

Avail: CASI HC A07/MF A02

The annual Aeronautics and Space Report includes a comprehensive description of the programmed activities and the accomplishments of all agencies of the United States in the field of aeronautics and space activities during the preceding calendar year. This year's report was prepared on a fiscal year basis, which is consistent with the budgetary period now used in programs of the Federal Government. The following areas are covered: space launch activities; space science; space flight and space technology; space communications; aeronautical activities; studies of the planet earth; and other aeronautical and space activities. RESEARCH AND TECHNOLOGY OBJECTIVES AND PLANS SUMMARY (RTOPS) Research and Technology Program, FY 1992

Feb. 1992 252 p

(NASA-TM-105441; NAS 1.15:105441) Avail: CASI HC A12/MF A03

This publication represents the NASA research and technology program for FY92. It is a compilation of the Summary portions of each of the RTOP's (Research and Technology Objectives and Plans) used for management review and control of research currently in progress throughout NASA. The RTOP Summary is designed to facilitate communication and coordination among concerned technical personnel in government, in industry, and in universities. The first section containing citations and abstracts of the RTOP's is followed by four indexes: Subject, Technical Monitor, Responsible NASA Organization, and RTOP Number. Author

AEROSPACE SPONSORED RESEARCH Summary Report, 1 Oct. 1992 - 30 Sep. 1993

1 Apr. 1994 175 p

(ATR-93(8498)-1) Avail: CASI HC A08/MF A02

Broad guidelines for the direction and emphasis of the overall research and development activities at Aerospace Corporation are periodically developed to assess in detail the trends in relevant technologies and their application to military space systems. Research and development activities are conducted in these technical categories: spacecraft and launch vehicles, electronic device technology, communications and navigation technology, information sciences, environmental technology, surveillance technology, plans and analysis, modeling and simulation, and systems engineering. This ASR summary report for FY 1993 contains brief reports of 33 selected projects carried out under the ASR program. They are a representative sample of the wide range of Aerospace internal research interests, from basic science to operational space systems engineering. This volume also includes abstracts of all 103 projects undertaken in FY 1993, and a comprehensive listing of all professional publications and technical reports produced using ASR funds during FY 1991-1993. CHRONOLOGY OF KSC AND KSC RELATED EVENTS FOR 1993

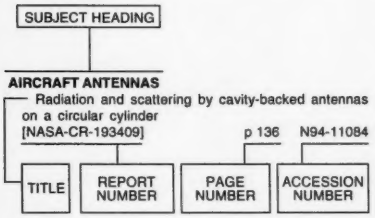
Ken Nail, Jr. Mar. 1994 289 p Prepared in cooperation with Sherikon Space Systems, Inc., Kennedy Space Center, FL
(NASA-TM-109196; NAS 1.15:109196; KSC-KHR-18) Avail: CASI HC A13/MF A03

This document is intended to serve as a record of KSC events and as a reference source for historians and other researchers. Arrangement is by day and month and individual articles are attributed to published sources. This edition has an index on p. 272. Author (revised)

Typical Subject Index Listing



The subject heading is a key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension is added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The page number helps you locate the citation in the abstract section. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus*.

[AD-A276618] p 3861 N94-32125
Pulse-splitting and AM-FM conversion in a nonlinear dispersive medium
[AD-A277041] p 3861 N94-32262
Interpenetrating polymer network acoustic damping material
[AD-D016141] p 3663 N94-32975

ACOUSTO-OPTICS
Noninvasive spectral analysis and beam mapping of focused ultrasound, part 1
[AD-A276211] p 3859 N94-31060

ACRYLATES
Mechanical properties of acrylate networks formed by visible laser-induced polymerization. 2. Control of the mechanical properties
[AD-A277111] p 3655 N94-31982
Solvent diffusion coefficient concentration dependence in polymer solutions
[AD-A277023] p 3655 N94-32005
Intramolecular charge transfer complexes as fluorescence probes for UV and visible light induced acrylate polymerization
[AD-A277129] p 3657 N94-32381
Microstructure of copolymers containing disperse red 1 and methyl methacrylate
[AD-A277140] p 3660 N94-32722

ACRYLIC RESINS
Oxide pigments in water: The colloid-chemical point of view
[PB94-148616] p 3633 N94-31591

ACTIVE CONTROL
The development of active integrated antennas and a design methodology
[ISBN-0-315-86119-3] p 3675 N94-31708
Active control for fin buffet alleviation
[AD-A276844] p 3586 N94-32224
Dynamic error compensation in robotic trusses
p 3738 N94-32486
Study of dynamic stall phenomenon and its control using vorticity, stream function and circulation form of the unsteady Navier-Stokes equations p 3572 N94-32714
Magnetohydrodynamic boundary layer control system
[AD-D016120] p 3710 N94-32958
Active vortex control for a high performance wing
[AD-D016140] p 3573 N94-32974

ACTIVE GALACTIC NUCLEI
Workshop on Physics of Accretion Disks Around Compact and Young Stars
[NASA-CR-195756] p 3927 N94-31116
Time-dependent behavior of active galactic nuclei with pair production p 3929 N94-31125
A multi-frequency study of an x ray selected sample of active galactic nuclei p 3937 N94-31987

ACTS
Channel and terminal description of the ACTS mobile terminal p 3599 N94-31428

ACTUATORS
Draft minutes of IAPG Mechanical Working Group meeting
[DE94-004954] p 3759 N94-31266
Employment of a porous gold actuator in ISFET-based coulometric sensor-actuator systems with application to protein characterization
[ISBN-9-09-005887-7] p 3689 N94-31536
Nd-YAG laser welding of the fiber optic connector to the header shell on the 2SL actuator
[DE94-006104] p 3723 N94-31621
Dynamic error compensation in robotic trusses
p 3738 N94-32486
Control strategies for systems with limited actuators
[NASA-CR-195307] p 3727 N94-32741
Feed-forward control of gear mesh vibration using piezoelectric actuators
[NASA-TM-106366] p 3728 N94-32902
Limiting vibration in systems with constant amplitude actuators through command preshaping
[NASA-CR-188284] p 3739 N94-32907
Design, characterization and control of the Unique Mobility Corporation robot p 3603 N94-33296
Design, development, and testing of a lightweight optical sensor cover system p 3604 N94-33302
Pip pin reliability and design p 3605 N94-33305
High precision moving magnet chopper for variable operation conditions p 3605 N94-33307
Implementation of heaters on thermally actuated spacecraft mechanisms p 3607 N94-33320
Payload holddown and release mechanism
p 3607 N94-33321

ADA (PROGRAMMING LANGUAGE)
Translating an AI application from Lisp to Ada: A case study
[NASA-TM-103845] p 3820 N94-32906
Ada support for the mathematical foundations of software engineering
[AD-A278031] p 3822 N94-33284

ADAPTATION
Isolating strain parameters correlated to skeletal adaptation p 3797 N94-31960
Analysis and synthesis of adaptive neural elements and assemblies
[AD-A277423] p 3836 N94-32996

ADAPTERS
Grounding ring for ground adapters
[AD-D016118] p 3697 N94-32962

ADAPTIVE CONTROL
Fast autodidactic adaptive equalization algorithms
[TELECOM-93-E-018] p 3670 N94-31174
On the use of genetic algorithms to solve the time-table problem
[REPT-90-060-REV] p 3829 N94-31176
The ant system: An autocatalytic optimizing process
[REPT-91-016-REV] p 3824 N94-31177
Concepts and environment
[REPT-93-032] p 3829 N94-31186
Filtering and recognition of moving boats in radar images
[REPT-93-039] p 3671 N94-31190
ART: Adaptive Resonance Theory
[TELECOM-93-D-020] p 3829 N94-31193
A neural network methodology for engineering applications: The learning control of robotic systems
[RR-480] p 3830 N94-31500
Adaptive operating systems concepts
[ETN-94-95754] p 3830 N94-31514
Adaptive nonlinear control of spacecraft
p 3609 N94-31564
Motion and force control of coordinated robots
[ISBN-0-315-86323-4] p 3724 N94-31714
Adaptive control of a robot in Cartesian coordinates: Analysis and implementation
[ISBN-0-315-86493-1] p 3831 N94-31798
On-line physical parameter identification and adaptive control of a launch vehicle p 3602 N94-31891
Adaptive control of telerobotic systems worn by humans
[AD-A276608] p 3834 N94-32036
Geometric structure of the adaptive controller of the human arm
[AD-A276797] p 3834 N94-32152
Optimal adaptive estimation algorithm for harmonic current reduction using power limited active line conditioners
[AD-A277354] p 3693 N94-32336
A fuzzy classifier system for process control
p 3839 N94-32422
State-space self-tuner for on-line adaptive control
[NASA-CR-195836] p 3835 N94-32943
Adaptive control of nonlinear and stochastic systems
[AD-A278411] p 3839 N94-33325

ADAPTIVE FILTERS
Modelling the late part of room impulse responses using adaptive filtering: On the recreation of reality
[CTH-E-93-01] p 3859 N94-31076
The generalized multi delay adaptive filter: Structure and convergence analysis
[TELECOM-93-D-004] p 3808 N94-31094
Fast autodidactic adaptive equalization algorithms
[TELECOM-93-E-018] p 3670 N94-31174
An adaptive Kalman filter excisor for suppressing narrowband interference
[AD-A276286] p 3671 N94-31253
Concurrent architectures for VLSI signal and image processing
[AD-A276124] p 3688 N94-31445
Recursive analysis of matrix scattering functions
[AD-A277264] p 3845 N94-32018

ADAPTIVE OPTICS
Design and early results of the sodium-layer laser guide star adaptive optics experiment at the Lawrence Livermore National Laboratory
[DE94-006653] p 3926 N94-32189
Phase-only correction of scintillated laser beams: Downrange experimental results
[AD-A277778] p 3722 N94-33282
ADDITIVES
Fuel property effects on engine combustion processes
[DE94-005529] p 3631 N94-31153
Influence of trace components on the viscoelastic properties of a polymer solution
[AD-A277171] p 3656 N94-32253
Processing and characterization of functionally gradient ceramic materials
[AD-A277154] p 3657 N94-32367
Development and preliminary evaluation of aryl ester boundary additives for perfluoropolyethers
[NASA-TM-106603] p 3663 N94-33024
Torque characteristics of solid lubricated precision bearings during oscillatory motion
[AD-A278133] p 3728 N94-33061
Optical properties of doped sol-gel silica glasses
[AD-A278094] p 3884 N94-33267
ADDUCTS
Combustion-related studies using weakly-bonded complexes
[DE94-006632] p 3633 N94-31493
ADHESION
Molecular interactions at metal/polyimide interfaces: A correlation with adhesion and bond durability
[AD-A276301] p 3650 N94-31297
High performance YBCO films
[AD-A276493] p 3897 N94-31531
Soft x ray photoelectron spectroscopy study of the interaction of Cr with MoS2(0001)
[AD-A276916] p 3635 N94-32233
New micro- and macroscopic models of contact and friction
[AD-A277240] p 3726 N94-32320
Conductive paints
[DE94-008508] p 3661 N94-32788
Compilation of diamond-like carbon properties for barriers and hard coatings
[DE94-008231] p 3661 N94-32803
Frictional behavior and adhesion of Ag and Au films applied to aluminum oxide by oxygen-ion assisted Screen Cage Ion Plating (SCIP)
[NASA-TM-106522] p 3647 N94-32931
ADHESION TESTS
Small cylindrical adhesive bonds
[PB94-148210] p 3651 N94-31585
Nd-YAG laser welding of the fiber optic connector to the header shell on the 2SL actuator
[DE94-006104] p 3723 N94-31621
ADHESIVE BONDING
Molecular interactions at metal/polyimide interfaces: A correlation with adhesion and bond durability
[AD-A276301] p 3650 N94-31297
Small cylindrical adhesive bonds
[PB94-148210] p 3651 N94-31585
Shearographic inspection of a DeHavilland DHC-7
[AD-A276716] p 3566 N94-32157
The cyclic fatigue behaviour of adhesive joints
[AD-A277080] p 3738 N94-32351
ADHESIVES
Small cylindrical adhesive bonds
[PB94-148210] p 3651 N94-31585
The cyclic fatigue behaviour of adhesive joints
[AD-A277080] p 3738 N94-32351
ADJOINTS
A cell-cycle model revisited
[CWI-AM-R9305] p 3851 N94-32229
ADRENERGICS
Review of pharmacological approach to improve cold tolerance p 3796 N94-31740
ADSORPTION
Modification of semiconductor surface properties with chemically bound molecular films
[AD-A276162] p 3895 N94-31081
Infrared spectroelectrochemical study of cyanide adsorption and reactions at platinum electrodes in aqueous perchlorate electrolyte
[AD-A276402] p 3631 N94-31238
Interaction of water with metal surfaces
[AD-A276260] p 3632 N94-31293
A new mechanism for surface diffusion: Motion of a substrate-adsorbate complex
[AD-A276072] p 3632 N94-31459
Double rotation NMR studies of zeolites and aluminophosphate molecular sieves
[DE94-007032] p 3866 N94-31637
Adsorption of water to the metal/polymer interface studied by neutron and x ray reflectivity
[DE94-005578] p 3851 N94-31649
Chemical interactions between protein molecules and polymer membrane materials
[DE94-006987] p 3651 N94-31672
The adsorption of sulfate on gold(111) in acidic aqueous media: Adlayer structural inferences from infrared spectroscopy and scanning tunneling microscopy
[AD-A276643] p 3642 N94-31997
A new-type of long-range restructuring of ordered metal surfaces induced by lateral adsorbate interactions: Iodide on AU(110) electrodes
[AD-A276633] p 3643 N94-32060
Surface chemistry and durability of borosilicate glass
[DE94-006734] p 3656 N94-32116
Vibrational spectroscopy at metal-solution interfaces: Some perspectives and prospects for electrochemical surface science
[AD-A276781] p 3644 N94-32169
Ab initio study of the epitaxial growth of Ge on Si(100) surface
[DE94-007245] p 3904 N94-32724
Surface probes of porous toluene/water ices: Adsorption kinetics and annealing spectra measured by second harmonic generation
[DE94-007564] p 3637 N94-32743
Metal cluster-rare gas van der Waals complexes: Microscopic models of physisorption
[DE94-008134] p 3873 N94-32797
Time-resolved analytical methods for liquid/solid interfaces
[DE94-008352] p 3637 N94-32826
Induced adsorption of chloride and bromide by submonolayer amounts of copper underpotentially deposited on Pt(111)
[AD-A278023] p 3648 N94-33182
Mars atmospheric loss and isotopic fractionation by solar-wind-induced sputtering and photochemical escape p 3947 N94-33208
Simultaneous laboratory measurements of CO2 and H2O adsorption on palagonite: Implications for the Martian climate and volatile reservoir p 3952 N94-33240
Sensitivity of electrochemical adlayer structure to the metal crystallographic orientation: Potential-independent iodide adsorption on Au(100) in comparison with other low-index surfaces
[AD-A276714] p 3909 N94-33273
ADVANCED VERY HIGH RESOLUTION RADIOMETER
Shiptrack database analysis
[AD-A277228] p 3746 N94-32025
Sensitivity analysis of the AVHRR infrared cirrus model
[AD-A276690] p 3784 N94-32117
ADVECTION
A fully two-dimensional, non-oscillatory advection scheme for momentum and scalar transport equations
[DM-66] p 3700 N94-31221
AERIAL PHOTOGRAPHY
A paraperspective factorization method for shape and motion recovery
[AD-A276513] p 3712 N94-31929
A model geophysics program
[DE94-007415] p 3747 N94-32203
Remote sensing for hurricane Andrew impact assessment p 3758 N94-32464
AERIAL RECONNAISSANCE
Army scout/reconnaissance helicopters versus unmanned aerial vehicles
[AD-A276902] p 3579 N94-32232
Remote sensing for hurricane Andrew impact assessment p 3758 N94-32464
AEROACOUSTICS
Investigation of sonic boom for the Space Shuttle: High cross-range orbiter
[NASA-TM-108238] p 3860 N94-31336
Investigation of sonic boom for the Space Shuttle: Low cross-range orbiter
[NASA-TM-108237] p 3860 N94-31337
Aeroacoustic sources in internal flows
[ISBN-9-03-86-0282-0] p 3860 N94-31653
Experimental and computational studies on propeller noise due to inflow distortion p 3860 N94-31846
AERODYNAMIC CHARACTERISTICS
Modeling of aircraft unsteady aerodynamic characteristics. Part 1: Postulated models
[NASA-TM-109120] p 3586 N94-32951
AERODYNAMIC COEFFICIENTS
Design and initial testing of a facility to measure unsteady pressures on an oscillating cascade with supersonic leading edge locus p 3569 N94-31880
A critical assessment of UH-60 main rotor blade airfoil data
[NASA-TM-103985] p 3571 N94-32063
AERODYNAMIC CONFIGURATIONS
Prediction of transonic potential flow with slipstreams around configurations
[FFA-TN-1992-15] p 3568 N94-31220
Large-scale shape optimization: Numerical methods, parallel algorithms, and applications to aerodynamic design p 3815 N94-31966
A new method for calculating wing along aerodynamics to angle of attack 180 deg
[AD-A277965] p 3574 N94-33263
AERODYNAMIC DRAG
CFD-based drag prediction: State-of-the-art, theory, prospects
[AD-B179297] p 3567 N94-31180
Response of wall turbulence to high frequency streamwise and spanwise oscillations p 3700 N94-31211
Control of hypersonic aerodynamic forces with surface blowing p 3567 N94-31216
Shock-dependent, optimum thrust wings in supersonic flow p 3570 N94-32027
Aerodynamic drag of droplets in turbulent flow fields
[ISBN-0-315-75827-9] p 3571 N94-32491
AERODYNAMIC FORCES
Control of hypersonic aerodynamic forces with surface blowing p 3567 N94-31216
AERODYNAMIC HEAT TRANSFER
Computational study of simultaneous heat and mass transfer in turbulent separated flows p 3704 N94-31843
AERODYNAMIC HEATING
A novel CFD/structural analysis of a cross parachute
[DE94-005271] p 3568 N94-31578
Implementation of a vibrationally linked chemical reaction model for DSMC
[NASA-TM-109109] p 3710 N94-33020
AERODYNAMIC INTERFERENCE
Active control for fin buffet alleviation
[AD-A276844] p 3586 N94-32224
AERODYNAMIC LOADS
A novel CFD/structural analysis of a cross parachute
[DE94-005271] p 3568 N94-31578
Local design optimization for composite transport fuselage crown panels p 3629 N94-33132
AERODYNAMIC NOISE
A pilot study of comfort criteria and sound quality metrics for sound inside cabins of propeller-driven aircraft
[CTH-F-93-03] p 3859 N94-31090
A mathematical model for simulating noise suppression of lined ejectors
[NASA-TP-3425] p 3861 N94-32930
AERODYNAMIC STABILITY
Flutter analysis of a supersonic cascade in time domain using an ADI Euler solver
[NASA-TM-105625] p 3739 N94-32883
AERODYNAMIC STALLING
Computational prediction of stall flutter in spanwise-finite blade cascades p 3584 N94-31967
Study of dynamic stall phenomenon and its control using vorticity, stream function and circulation form of the unsteady Navier-Stokes equations p 3572 N94-32714
AERODYNAMICS
The effect of an axial flow component on a circular cylinder wake p 3699 N94-31209
Aeronautical engineering: A continuing bibliography with indexes (supplement 302)
[NASA-SP-7037(302)] p 3565 N94-31342
Aeronautical engineering: A continuing bibliography with indexes (supplement 303)
[NASA-SP-7037(303)] p 3565 N94-31361
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-flight dynamics module, volume 4
[AD-A276971] p 3590 N94-32396
Aeronautical engineering: A continuing bibliography with indexes (supplement 304)
[NASA-SP-7037(304)] p 3566 N94-32853
A new method for calculating wing along aerodynamics to angle of attack 180 deg
[AD-A277965] p 3574 N94-33263
Cumulative reports and publications through December 31, 1993
[NASA-CR-194889] p 3806 N94-33286
AEROELASTICITY
Aeroelastic vibrations of lifting surfaces
[ECL-91-01] p 3585 N94-31677
Computational prediction of stall flutter in spanwise-finite blade cascades p 3584 N94-31967
A finite-difference approximate-factorization algorithm for solution of the unsteady transonic small-disturbance equation
[NASA-TP-3129] p 3572 N94-32865
Flutter analysis of a supersonic cascade in time domain using an ADI Euler solver
[NASA-TM-105625] p 3739 N94-32883
AEROGELS
Structure-property relationships of carbon aerogels
[DE94-007120] p 3860 N94-32687

Enhanced thermal capacity aerogels summary report, FY 1993
[DE94-008888] p 3639 N94-33260

AERONAUTICAL ENGINEERING

Aeronautical engineering: A continuing bibliography with indexes (supplement 302)
[NASA-SP-7037(302)] p 3565 N94-31342
Aeronautical engineering: A continuing bibliography with indexes (supplement 303)
[NASA-SP-7037(303)] p 3565 N94-31381
Aircraft weight prediction capability. Volume 1: Weight study and results
[AD-A277206] p 3579 N94-32062
Aeronautical engineering: A continuing bibliography with indexes (supplement 304)
[NASA-SP-7037(304)] p 3566 N94-32853
Aeronautics and space report of the President: Fiscal year 1993 activities p 3966 N94-32854
Aviation human factors research in US universities: Potential contributions to national needs
[NASA-TM-108814] p 3575 N94-32927
Research and technology, 1993
[NASA-TM-106376] p 3567 N94-33046

AERONAUTICS

Research and Technology Objectives and Plans Summary (RTOPS)
[NASA-TM-105441] p 3966 N94-32885

AERONOMY

Odin aeronomy science: A phase-A report by the Aeronomy Science Working Group for the Odin satellite
[AP-31] p 3770 N94-31222

AEROSERVOELASTICITY

Aeroelastic vibrations of lifting surfaces
[ECL-91-01] p 3585 N94-31677

AEROSOLS

Desert aerosols: Sources, transports, and impacts determined by remote sensing p 3770 N94-31003
Optical and image transmission through desert atmospheres
[AD-A276022] p 3742 N94-31496
Time-dependent behavior of Mount Pinatubo aerosol
[DE94-001877] p 3764 N94-31601
Concentration system performance degradation in the aftermath of Mount Pinatubo
[DE94-001879] p 3764 N94-31602
Radar scattering from the summer polar mesosphere: Theory and observations p 3772 N94-32077
Evaluation of sulfate aerosol optical depths over the North Atlantic and comparison with satellite observations
[DE94-005457] p 3746 N94-32100
A parameterization of cloud droplet nucleation
[DE94-007469] p 3785 N94-32268
Backscatter and transmission of aerosol at UV through middle IR wavelengths
[AD-A277127] p 3718 N94-32305
Fine resolution atmospheric sulfate model driven by operational meteorological data: Comparison with observations
[DE94-002994] p 3766 N94-32691
Climate effects of anthropogenic sulfate: Simulations from a coupled chemistry/climate model
[DE94-004352] p 3767 N94-32789
Stabilized alumina/ethanol colloidal dispersion for seeding high temperature air flows
[NASA-TM-106591] p 3713 N94-32983
Counting particles emitted by stratospheric aircraft and measuring size of particles emitted by stratospheric aircraft
[NASA-CR-195908] p 3769 N94-33170
Aerosols scattering and near-infrared observations of the Martian surface p 3946 N94-33204
Groundbased monitoring of Martian atmospheric opacity p 3947 N94-33207

AEROSPACE ENGINEERING

AGARD highlights 94/1, April 1994
[AGARD-HIGHLIGHTS-94/1] p 3956 N94-31196
AGARD membership, 1994
[AGARD-MEMB-94] p 3914 N94-31197
An innovative approach to space education
p 3600 N94-31436
Aerospace test facilities at NASA LERC Plumbrook
[NASA-TM-109755] p 3602 N94-31814
Welcome to the Ohio Aerospace Institute
[NASA-TM-109756] p 3913 N94-31815
NASA strategic plan
[NASA-TM-109780] p 3915 N94-32222
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 5: Aerospace librarians and technical information specialists as information intermediaries: A report of phase 2 activities of the NASA/DOD Aerospace Knowledge Diffusion Research Project
[NASA-TM-109777] p 3921 N94-32829
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 6: Aerospace knowledge diffusion in the academic community: A report of phase 3 activities of the NASA/DOD Aerospace Knowledge Diffusion Research Project
[NASA-TM-109771] p 3921 N94-32830
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 10: The NASA/DOD Aerospace Knowledge Diffusion Research Project
[NASA-TM-109769] p 3921 N94-32831
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 12: The diffusion of federally funded aerospace research and development (R/D) and the information seeking behavior of US aerospace engineers and scientists
[NASA-TM-109404] p 3921 N94-32832
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 18: Scientific and Technical Information (STI) policy and the competitive position of the US aerospace industry
[NASA-TM-109782] p 3921 N94-32833
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 11: The voice of the user: How US aerospace engineers and scientists view DOD technical reports
[NASA-TM-109348] p 3921 N94-32834
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 1: The value of scientific and technical information (STI), its relationship to Research and Development (R/D), and its use by US aerospace engineers and scientists
[NASA-TM-109774] p 3922 N94-32835
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 25: The technical communications practices of British aerospace engineers and scientists: Results of the phase 4 RAeS mail survey
[NASA-TM-109096] p 3922 N94-32836
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 24: The technical communications practices of US aerospace engineers and scientists: Results of the phase 1 SAE mail survey
[NASA-TM-109088] p 3922 N94-32837
Aeronautics and space report of the President: Fiscal year 1993 activities p 3966 N94-32854
Research and Technology Objectives and Plans Summary (RTOPS)
[NASA-TM-105441] p 3966 N94-32885

AEROSPACE ENVIRONMENTS

LDEF Materials Results for Spacecraft Applications
[NASA-CP-3257] p 3591 N94-31012
Space environment durability of beta cloth in LDEF thermal blankets p 3591 N94-31015
Impact of LDEF photovoltaic experiment findings upon spacecraft solar array design and development requirements p 3594 N94-31028
Physical properties of glasses exposed to Earth-facing and trailing-side environments on LDEF
p 3594 N94-31030
Space environmental effects on polymer composites: Research needs and opportunities p 3595 N94-31035
Physical chemistry of molecules and grains in space
[AD-A276037] p 3932 N94-31280
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-environment module, volume 13
[AD-A276980] p 3589 N94-32319
Vibration Isolation Technology (VIT) ATD project
[NASA-TM-106496] p 3567 N94-33064
Spacecraft environmental anomalies expert system
[AD-A277962] p 3612 N94-33262

AEROSPACE INDUSTRY

Welcome to the Ohio Aerospace Institute
[NASA-TM-109756] p 3913 N94-31815
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 18: Scientific and Technical Information (STI) policy and the competitive position of the US aerospace industry
[NASA-TM-109782] p 3921 N94-32833

AEROSPACE MEDICINE

Aerospace medicine and biology: A continuing bibliography with indexes (supplement 388)
[NASA-SP-7011(388)] p 3795 N94-31414
Aerospace medicine and biology: A continuing bibliography with indexes (supplement 389)
[NASA-SP-7011(389)] p 3797 N94-32347
Aerospace medicine and biology: A continuing bibliography with indexes (supplement 385)
[NASA-SP-7011(385)] p 3797 N94-32348

AEROSPACE PLANES

Hypervelocity Tunnel 9 Mach 10/14 Calibration
[AD-A275960] p 3587 N94-31318
High temperature NASP engine seal development
[NASA-TM-109750] p 3725 N94-31804
Futurepath 3
[NASA-TM-109762] p 3735 N94-31819

AEROSPACE SCIENCES

An innovative approach to space education
p 3600 N94-31436
ISU in an era of partial reconvergence — International Space University p 3600 N94-31438
The sky is your classroom
[NASA-TM-109759] p 3914 N94-31887
Research and Technology Objectives and Plans Summary (RTOPS)
[NASA-TM-105441] p 3966 N94-32885

AEROSPACE SYSTEMS

Aerospace software engineering for advanced systems architectures
[AD-A277101] p 3581 N94-31977
Computer modelling of cyclic deformation of high-temperature materials
[AD-A277056] p 3623 N94-32012
Honeycomb sandwich structures: Vented versus unvented designs for space systems
[AD-A276713] p 3624 N94-32122
Deployable and retractable telescoping tubular structure development p 3607 N94-33317
Lessons learned from selecting and testing spaceflight potentiometers p 3607 N94-33318

AEROSPACE TECHNOLOGY TRANSFER

AGARD highlights 94/1, April 1994
[AGARD-HIGHLIGHTS-94/1] p 3956 N94-31196
Application of dexterous space robotics technology to myoelectric prostheses p 3729 N94-32450
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 10: The NASA/DOD Aerospace Knowledge Diffusion Research Project
[NASA-TM-109769] p 3921 N94-32831

AEROTHERMODYNAMICS

The prediction of convective transfer on the thermal insulation of a solid-propellant rocket motor
[ONERA-NT-1993-15] p 3614 N94-31423

AFRICA

Dynamic climatology of West Africa
p 3778 N94-30988
Some aspects of the drought in North Africa and in the Mediterranean basin p 3778 N94-30989

AGE FACTOR

Tripping over obstacles: Biomechanical analyses of how young and old try to avoid it p 3803 N94-31954

AGING (MATERIALS)

Aging effects on the microstructure, surface characteristics and wettability of Cu pretinned with Sn-Pb solders
[DE94-007033] p 3641 N94-31638

AGING (METALLURGY)

Continuous measurement of aging response in aluminum alloys by eddy current methods
[AD-A277233] p 3644 N94-32371

AGRICULTURE

High resolution spectroscopy in agriculture: Results of the EISAC 1989 campaign p 3745 N94-31864
Extraction of agricultural parameters from imaging-spectrometry data and simulated MERIS data through red edge analysis p 3745 N94-31865
The use of SPOT, and the contribution of ERS-1, in the assessment of urban pressure on agriculture land in Greater Tunis (Tunisia) p 3749 N94-32534
Integration of ERS-1 images into the European Agriculture Statistics project Action 4: Thematic aspect
p 3753 N94-32554
Rapid estimates of crop acreage and production at European scale using high resolution imagery
p 3754 N94-32557
Food security in the context of global environmental change
[DE94-007481] p 3768 N94-32812

AIR COOLING

A review of microclimate cooling systems in the chemical, biological, radiological environment
[AD-A276446] p 3802 N94-31302

AIR FLOW

Design of a two dimensional planer pressurized air labyrinth seal test rig
[AD-A277232] p 3726 N94-32370
Low power, constant-flow air pump systems
[DE94-007463] p 3727 N94-32758
Stabilized alumina/ethanol colloidal dispersion for seeding high temperature air flows
[NASA-TM-106591] p 3713 N94-32983

AIR JETS

Turbulence structure of a premixed flame in a coaxial free air jet in the presence or absence of a base flow
[ISBN-0-315-78739-2] p 3633 N94-31471

AIR LAND INTERACTIONS

The surface parameters: Remote sensing observations and climatology applications p 3779 N94-31001
Surface fluxes of trace gases derived from convective-layer profiles p 3704 N94-31774

An evaluation of RAMS radiation schemes by field measurements
[DE94-008053] p 3767 N94-32750
Numerical simulation of thermally induced near-surface flows over Martian terrain p 3949 N94-33223
Carbonate formation on Mars: Latest experiments p 3950 N94-33231

AIR MASSES
Coastal boundary layer and refractivity measurements using the ground-based high resolution interferometer sounder (GB-HIS)
[AD-A277980] p 3683 N94-33159

AIR NAVIGATION
The contribution of aeronautics and astronautics to the quality of life on Earth
[ILR-MITT-283(1993)] p 3764 N94-31611
Flight technical error for category B non-precision approaches and missed approaches using non-differential GPS for course guidance
[PB94-142734] p 3576 N94-31680
Aircraft communication and navigation systems and communication and navigation systems
[AD-A277309] p 3582 N94-32328
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-navigation/communication module, volume 6
[AD-A276973] p 3590 N94-32398
An evaluation framework for designing a night vision, computer-based trainer
[AD-A278005] p 3590 N94-33139

AIR POLLUTION
Emissions of greenhouse gases from the use of transportation fuels and electricity
[DE94-006166] p 3765 N94-31625
Control and monitoring of heavy metal emissions
[VTT-TIED-1508] p 3765 N94-31657
Evaluation of sulfate aerosol optical depths over the North Atlantic and comparison with satellite observations
[DE94-005457] p 3746 N94-32100
Photothermal laser deflection, an innovative technique to measure particles in exhausts
[AD-A277151] p 3718 N94-32366
Carbon dioxide abatement as a differential game
[DE94-722023] p 3765 N94-32590
Fine resolution atmospheric sulfate model driven by operational meteorological data: Comparison with observations
[DE94-002994] p 3766 N94-32691
Identification of research relating to the critical loads concept and its potential application to the regulation of acidic deposition
[DE94-008234] p 3767 N94-32752
Mexico City ozone concentrations as a function of readily-available meteorological parameters
[DE94-007576] p 3768 N94-32814
Transport and diffusion in turbulent fields modeling and measurements techniques
[AD-A278114] p 3769 N94-33110

AIR PURIFICATION
In-bed multiport sampling system
[AD-A275908] p 3763 N94-31339
Removal of CO2 from flue gases by algae
[DE94-008039] p 3766 N94-32703

AIR QUALITY
Strategies for survival in the new environmental era
[AD-A276827] p 3765 N94-32195
Wind-speed measurements with a scanning elastic-backscatter lidar
[DE94-004974] p 3785 N94-32726
Performance of a new wind updating system for a prognostic meteorological model in the environs of Mexico City
[DE94-006243] p 3786 N94-32937
Transport and diffusion in turbulent fields modeling and measurements techniques
[AD-A278114] p 3769 N94-33110

AIR SAMPLING
In-bed multiport sampling system
[AD-A275908] p 3763 N94-31339
Low power, constant-flow air pump systems
[DE94-007463] p 3727 N94-32758
Counting particles emitted by stratospheric aircraft and measuring size of particles emitted by stratospheric aircraft
[NASA-CR-195908] p 3769 N94-33170

AIR TRAFFIC
The 1993 aviation system capacity plan
[AD-A276958] p 3575 N94-32620
Civil tiltrotor market penetration: Effects on Northeast corridor airport delay
[AD-A277534] p 3576 N94-32955
FAA aviation forecasts, fiscal years 1994-2005
[AD-A277808] p 3566 N94-33016

AIR TRAFFIC CONTROL
Evaluation for the development of taxiway lighting intensity standards
[AD-A276706] p 3588 N94-32120
Plan recognition for an air traffic control simulation
[DSIS-94-01221] p 3577 N94-32505
Three dimensional audio versus head down TCAS displays
[NASA-CR-177636] p 3576 N94-33063
Cockpit Electronic Display Workshop: A synopsis
[AD-A277728] p 3583 N94-33280
A heuristic multiple target tracker p 3686 N94-33346

AIR TRANSPORTATION
The contribution of aeronautics and astronautics to the quality of life on Earth
[ILR-MITT-283(1993)] p 3764 N94-31611
The 1993 aviation system capacity plan
[AD-A276958] p 3575 N94-32620
Airborne Trailblazer: Two decades with NASA Langley's 737 flying laboratory
[NASA-SP-4216] p 3566 N94-32793
Annual review of aircraft accident data: US air carrier operations, calendar year 1991
[PB94-158847] p 3575 N94-32925
Civil tiltrotor market penetration: Effects on Northeast corridor airport delay
[AD-A277534] p 3576 N94-32955
FAA aviation forecasts, fiscal years 1994-2005
[AD-A277808] p 3566 N94-33016

AIR WATER INTERACTIONS
Subtropical Climates and Their Evolution: From Space-Based Observation to Modelling
[ISBN-2-85-428333-3] p 3776 N94-30981
Climatologic flux in tropical ocean p 3777 N94-30985
Low frequence variability of the ocean atmosphere coupled system p 3777 N94-30986
Interaction processes between the ocean and the atmosphere p 3777 N94-30987
The ocean-atmosphere interactions in the Mediterranean Sea p 3779 N94-30995
Investigation of carbon dioxide in the central South Pacific Ocean (WOCE Sections P-16C and P-17C) during the TUNES/2 expedition of the R/V Thomas Washington, July-August, 1991
[DE94-006638] p 3763 N94-31347
The effect of westerly wind bursts on a tropical ocean general circulation model
[AD-A276423] p 3788 N94-31448
Research in marine boundary layer intermittency
[AD-A276076] p 3701 N94-31460
Air-sea interaction patterns in the equatorial Pacific
[AD-A277305] p 3788 N94-32072
ENSO forced variations of the sea surface temperature and adjusted sea level along the west coast of the United States
[AD-A277306] p 3789 N94-32327
High resolution properties of the marine atmospheric boundary layer
[DE94-006235] p 3774 N94-32736
Ocean variability and its influence on the detectability of greenhouse warming signals
[DE94-008670] p 3790 N94-32881
Index and bulk parameters for frequency-direction spectra measured at CERC Field Research Facility
[AD-A277759] p 3791 N94-33085
SEASOAR and CTD observations during a COARE surveys cruise, W9211C, 22 January - 22 February, 1993
[AD-A277925] p 3791 N94-33244

AIRBORNE EQUIPMENT
Airborne instruments p 3757 N94-31006
European Imaging Spectroscopy Aircraft Campaign
[ESA-SP-360] p 3743 N94-31853
The European Imaging Spectroscopy Airborne Campaign (EISAC). Data takes and evaluation programme: An overview p 3743 N94-31854
NORSMAP 1989: Norwegian remote sensing spectroscopy for mapping and monitoring or algal blooms and pollution p 3744 N94-31856
Analysis of GER imaging spectrometry data for the identification of soil and vegetation parameters in land degradation studies p 3744 N94-31857
Inflight calibration, preprocessing, and data evaluation of GER 2 imaging spectrometry data p 3744 N94-31858
Investigation on correction models for airborne imaging spectrometry data from the EISAC-campaign for geoscientific purposes p 3745 N94-31861
SATCOM feasibility study for search and rescue aircraft
[DSIS-94-01083] p 3575 N94-31902
Airborne Trailblazer: Two decades with NASA Langley's 737 flying laboratory
[NASA-SP-4216] p 3566 N94-32793

AIRBORNE LASERS
Statistics of time averaged atmospheric scintillation
[DE94-006998] p 3747 N94-32249

AIRBORNE RADAR
Airborne SAR as a complement to SPOT HRV in land-cover classification: The use of normalization and principal components analysis p 3750 N94-32539
The use of ERS-1 within an operational ice monitoring program p 3751 N94-32545
Optimal geological data extraction from SPOT-radar synergism with samples from Djebel Amour (Algeria), Red Sea Hills (Sudan), Sirte Basin (Libya), and Magdalena Valley (Colombia) p 3752 N94-32548
Respective contributions of VIS-PIR, SAR-ERS 1, and airborne radar data for morphostructural and morphoneotectonic analysis: Practical examples p 3752 N94-32549

AIRBORNE/SPACEBORNE COMPUTERS
An investigation of airborne GPS/INS for high accuracy position and velocity determination
[DE94-006139] p 3576 N94-31306
The maintenance of operational flight program
[AD-A276363] p 3565 N94-31367
Technologies for avionics embedded computer systems
[AD-A276364] p 3581 N94-31368
Testing Operational Flight Programs (OFP's)
[AD-A276361] p 3578 N94-31387
Low power, constant-flow air pump systems
[DE94-007463] p 3727 N94-32758
Data processing algorithms for on-board satellite event analysis
[AD-A278406] p 3838 N94-33168

AIRCRAFT ACCIDENT INVESTIGATION
Annual review of aircraft accident data: US air carrier operations, calendar year 1991
[PB94-158847] p 3575 N94-32925
Aircraft incident report: In-flight turbulence encounter and loss of portions of the elevators, China Airlines Flight CI-012, McDonnell Douglas MD-11-P, Taiwan Registration B-150 about 20 miles east of Japan, 7 December 1992
[PB94-910403] p 3576 N94-32938

AIRCRAFT ACCIDENTS
Rotorcraft ditchings and water-related impacts that occurred from 1982 - 1989, phase 2
[AD-A276473] p 3574 N94-31246
Estimating the impact of crashworthiness standards on mortality and morbidity events in the US Army rotary-wing aircraft mishaps
[AD-A277121] p 3575 N94-32363
Annual review of aircraft accident data: US air carrier operations, calendar year 1991
[PB94-158847] p 3575 N94-32925
Aircraft incident report: In-flight turbulence encounter and loss of portions of the elevators, China Airlines Flight CI-012, McDonnell Douglas MD-11-P, Taiwan Registration B-150 about 20 miles east of Japan, 7 December 1992
[PB94-910403] p 3576 N94-32938

AIRCRAFT ANTENNAS
Applied Computational Electromagnetics Society Journal, volume 9, number 1, March 1994
[AD-A276753] p 3679 N94-32183

AIRCRAFT COMMUNICATION
Communications networks in stressed environments
[AD-A275967] p 3672 N94-31384
SATCOM feasibility study for search and rescue aircraft
[DSIS-94-01083] p 3575 N94-31902
Aircraft communication and navigation systems and communication and navigation systems
[AD-A277309] p 3582 N94-32328
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-navigation/communication module, volume 6
[AD-A276973] p 3590 N94-32398

AIRCRAFT COMPARTMENTS
A pilot study of comfort criteria and sound quality metrics for sound inside cabins of propeller-driven aircraft
[CTH-F-93-03] p 3859 N94-31090

AIRCRAFT CONFIGURATIONS
A finite-difference approximate-factorization algorithm for solution of the unsteady transonic small-disturbance equation
[NASA-TP-3129] p 3572 N94-32865
Modeling of aircraft unsteady aerodynamic characteristics. Part 1: Postulated models
[NASA-TM-109120] p 3586 N94-32951

AIRCRAFT CONSTRUCTION MATERIALS
Damage tolerance aspects of a full composite airplane fuselage: Requirements, modelling, predictions, experiments
[LR-728] p 3578 N94-31674
Cracking induced in small fretting: Application to the case of aeronautical aluminum alloys
[ECL-92-50] p 3735 N94-31870

Location of impact damage sites in composite aircraft structures, task 3.4.1
[DSIS-94-01590] p 3621 N94-31892
Effects of frequency and amplitude variations of superimposed minor loading sequences on the corrosion fatigue behavior of aircraft structural aluminum alloys
p 3578 N94-31957
Innovative fabrication processing of advanced composite materials concepts for primary aircraft structures
[NASA-CR-189558] p 3626 N94-32877
Second NASA Advanced Composites Technology Conference
[NASA-CP-3154] p 3627 N94-33121
COINS: A composites information database system
p 3627 N94-33123
Composite fuselage shell structures research at NASA Langley Research Center p 3628 N94-33124
Structural testing of the technology integration box beam p 3628 N94-33125
Technology integration box beam failure study
p 3628 N94-33126
Development of stitched/RTM composite primary structures p 3628 N94-33127
Resin transfer molding for advanced composite primary wing and fuselage structures p 3628 N94-33128
Test and analysis results for composite transport fuselage and wing structures p 3628 N94-33129
Recent progress in NASA Langley Research Center textile reinforced composites program
p 3629 N94-33134
Advanced textile applications for primary aircraft structures p 3629 N94-33135
Comparison of resin film infusion, resin transfer molding, and consolidation of textile preforms for primary aircraft structure p 3630 N94-33136
Structural integrity of intelligent materials and structures
[AD-A278397] p 3630 N94-33165

AIRCRAFT CONTROL
Antiwindup analysis and design approaches for MIMO systems
[NASA-CR-195304] p 3584 N94-32075

AIRCRAFT DESIGN
Unmanned Air Vehicle/Remotely Piloted Vehicle analysis for lethal UAV/RPV
[AD-A276052] p 3578 N94-31442
Multidisciplinary optimization of high-speed civil transport configurations using variable-complexity modeling p 3578 N94-31881
A comparison of military and commercial aircraft development
[AD-A276830] p 3575 N94-32168
Analytical Design Package (ADP2): A computer aided engineering tool for aircraft transparency design
p 3823 N94-32430
Application of a design-build-team approach to low cost and weight composite fuselage structure
[NASA-CR-4418] p 3626 N94-32863
Second NASA Advanced Composites Technology Conference
[NASA-CP-3154] p 3627 N94-33121
Designer's unified cost model p 3627 N94-33122
COINS: A composites information database system
p 3627 N94-33123
Structural testing of the technology integration box beam p 3628 N94-33125
Local design optimization for composite transport fuselage crown panels p 3629 N94-33132
Recent progress in NASA Langley Research Center textile reinforced composites program
p 3629 N94-33134
The National Aerospace Plane (NASP): Development issues for the follow-on vehicle
[AD-A278417] p 3581 N94-33329

AIRCRAFT DETECTION
Fault detection and isolation for the Bluebird test bed aircraft
[AD-A277979] p 3586 N94-33086

AIRCRAFT ENGINES
An analysis of non-integerizing the aircraft engines Cost Effectiveness Analysis Spreadsheet Model (CEAMOD version 2.0)
[AD-A276251] p 3583 N94-31290
Thermal-mechanical fatigue crack growth in aircraft engine materials
[ISBN-0-315-86543-1] p 3734 N94-31707
Development of a cascade simulation of fan-passage flow
[AD-A277234] p 3584 N94-32026
Analysis of Navy aircraft engine and engine component warranties
[AD-A276936] p 3584 N94-32238
A user's manual for the cost effectiveness analysis spreadsheet model for aircraft engines (CEAMOD version 2.0)
[AD-A278042] p 3585 N94-33266
Analysis of intermediate level maintenance following F404-GE-400 engine component life reductions
[AD-A277918] p 3585 N94-33283
An expert system application for troubleshooting the CF18 F404 engine p 3585 N94-33339

AIRCRAFT EQUIPMENT
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-radar module, volume 8
[AD-A276975] p 3589 N94-32314

AIRCRAFT FUELS
Improved resealing procedures for the second deseal/reseal program in RAAF F111 aircraft fuel tanks
[AD-A277069] p 3580 N94-32378

AIRCRAFT HAZARDS
Aircraft icing handbook (update)
[AD-A276499] p 3574 N94-31678
WHIPICE — computer program for analysis of aircraft deicing
[NASA-TM-109749] p 3574 N94-31803

AIRCRAFT ICING
Aircraft icing handbook (update)
[AD-A276499] p 3574 N94-31678
WHIPICE — computer program for analysis of aircraft deicing
[NASA-TM-109749] p 3574 N94-31803
Continuous measurement of aircraft wing icing
p 3576 N94-32454
An experimental study of the flowfield on a semispan rectangular wing with a simulated glaze ice accretion
[NASA-CR-195301] p 3571 N94-32475

AIRCRAFT INDUSTRY
Prospects for the French fighter industry in a post-cold war environment: Is the future more than a mirage?
p 3565 N94-31959

AIRCRAFT INSTRUMENTS
Study of virtual prototyping of aircraft instruments
[CMC-0687-1090] p 3581 N94-31903

AIRCRAFT LANDING
Fuzzy-neural control of an aircraft tracking camera platform p 3839 N94-32423

AIRCRAFT LIGHTS
Evaluation of intensity distribution profiles for US. Army rotorcraft position lighting adapted for image intensifier operations
[AD-A276459] p 3804 N94-32171

AIRCRAFT MAINTENANCE
A laboratory study of multiple site damage in fuselage lap splices
[AD-A276151] p 3578 N94-31078
An analysis of the maintenance performance measurement system for LAMPS MK 3 helicopter squadrons
[AD-A276421] p 3565 N94-31332
An evaluation of aircraft maintenance performance factors in the objective wing
[AD-A276010] p 3565 N94-31362
Initial estimates of Integrated Maintenance Information System (IMIS) costs and benefits, volume 1
[AD-A276144] p 3565 N94-31830
Shearographic inspection of a DeHavilland DHC-7
[AD-A276716] p 3566 N94-32157
Human Computer Interface Specifications (HCIS) for the Integrated Maintenance Information System (IMIS)
[AD-A277184] p 3566 N94-32254
Fault detection and isolation for the Bluebird test bed aircraft
[AD-A277979] p 3586 N94-33086
A user's manual for the cost effectiveness analysis spreadsheet model for aircraft engines (CEAMOD version 2.0)
[AD-A278042] p 3585 N94-33266
Analysis of intermediate level maintenance following F404-GE-400 engine component life reductions
[AD-A277918] p 3585 N94-33283
Scheduling fighter missions using an expert system with an operations research module p 3853 N94-33337
The CF-18 diagnostic and maintenance expert system project p 3567 N94-33338
An expert system application for troubleshooting the CF18 F404 engine p 3585 N94-33339

AIRCRAFT MODELS
Controls design with crossfeeds for hovering rotorcraft using quantitative feedback theory
[NASA-CR-195765] p 3585 N94-31203
Numerical simulation of combined external/internal transonic flow on the forebody/inlet of the AV-8B Harrier 2 p 3569 N94-31759
Six degree of freedom flight dynamic model of a Mk-82 store
[AD-A277065] p 3580 N94-32362
Fault detection and isolation for the Bluebird test bed aircraft
[AD-A277979] p 3586 N94-33086

AIRCRAFT NOISE
Investigation of sonic boom for the Space Shuttle: High cross-range orbiter
[NASA-TM-108238] p 3860 N94-31336
Investigation of sonic boom for the Space Shuttle: Low cross-range orbiter
[NASA-TM-108237] p 3860 N94-31337
Common property resources and low-level flying in Labrador: Flight, fight or fancy?
[ISBN-0-315-87318-3] p 3924 N94-31732
Heliport Noise Model (HNM) version 2.2 (user's guide)
[AD-A277072] p 3861 N94-32418
Reciprocity-based experimental determination of dynamic forces and moments: A feasibility study
[NASA-CR-194905] p 3862 N94-33023

AIRCRAFT PERFORMANCE
Unmanned Air Vehicle/Remotely Piloted Vehicle analysis for lethal UAV/RPV
[AD-A276052] p 3578 N94-31442
Multidisciplinary optimization of high-speed civil transport configurations using variable-complexity modeling p 3578 N94-31881

AIRCRAFT PILOTS
Unit specific crew rest strategies: Phase 1 evaluation of the 1/212th Aviation Battalion during shiftwork transitions
[AD-A277122] p 3804 N94-32379

AIRCRAFT PRODUCTION COSTS
Designer's unified cost model p 3627 N94-33122
COINS: A composites information database system
p 3627 N94-33123
Composite fuselage crown panel manufacturing technology p 3629 N94-33133

AIRCRAFT RELIABILITY
An evaluation of aircraft maintenance performance factors in the objective wing
[AD-A276010] p 3565 N94-31362

AIRCRAFT SAFETY
Aircraft incident report: In-flight turbulence encounter and loss of portions of the elevators, China Airlines Flight CI-012, McDonnell Douglas MD-11-P, Taiwan Registration B-150 about 20 miles east of Japan, 7 December 1992
[PB94-910403] p 3576 N94-32938

AIRCRAFT STRUCTURES
Multiple-site damage in aircraft fuselage structures
[LR-729] p 3578 N94-31675
Location of impact damage sites in composite aircraft structures, task 3.4.1
[DSIS-94-01590] p 3621 N94-31892
Effects of frequency and amplitude variations of superimposed minor loading sequences on the corrosion fatigue behavior of aircraft structural aluminum alloys
p 3578 N94-31957
Finite element analysis of MB326H Macchi wing lower spar cap fatigue cracks
[AD-A277062] p 3580 N94-32264
Development of thermoplastic composite aircraft structures
[NASA-CR-189593] p 3626 N94-32860
Innovative fabrication processing of advanced composite materials concepts for primary aircraft structures
[NASA-CR-189558] p 3626 N94-32877
Second NASA Advanced Composites Technology Conference
[NASA-CP-3154] p 3627 N94-33121
Composite fuselage shell structures research at NASA Langley Research Center p 3628 N94-33124
Technology integration box beam failure study
p 3628 N94-33126
Resin transfer molding for advanced composite primary wing and fuselage structures p 3628 N94-33128
Recent progress in NASA Langley Research Center textile reinforced composites program
p 3629 N94-33134
Advanced textile applications for primary aircraft structures p 3629 N94-33135
Comparison of resin film infusion, resin transfer molding, and consolidation of textile preforms for primary aircraft structure p 3630 N94-33136
Characterization and manufacture of braided composites for large commercial aircraft structures
p 3630 N94-33137
Structural integrity of intelligent materials and structures
[AD-A278397] p 3630 N94-33165

AIRCRAFT TIRES
Computational methods for frictional contact with applications to the Space Shuttle orbiter nose-gear tire
p 3608 N94-32295

AIRCRAFT WAKES
A study of the development and attenuation of wing-generated, vortical wakes p 3570 N94-31971

AIRFOIL OSCILLATIONS
Design and initial testing of a facility to measure unsteady pressures on an oscillating cascade with supersonic leading edge locus p 3569 N94-31880
Flutter analysis of a supersonic cascade in time domain using an ADI Euler solver
[NASA-TM-105625] p 3739 N94-32883
AIRFOIL PROFILES
Shock-dependent, optimum thrust wings in supersonic flow p 3570 N94-32027
AIRFOILS
On an adaptation method for 2-dimensional C-type grids
[W-9322] p 3569 N94-31822
On an adaptation method for dense, 2D, C-type grids
[W-9321] p 3706 N94-32045
Fatigue in single crystal nickel superalloys
[AD-A276662] p 3843 N94-32047
The analysis of wake-induced unsteady aerodynamics related to higher harmonic control
[AD-A277914] p 3573 N94-33108
AIRFRAMES
Dual-band infrared imaging to detect corrosion damage within airframes and concrete structures
[DE94-006047] p 3580 N94-32658
AIRGLOW
Time-resolved IR spectroscopy, energy transfer, and state-to-state collision dynamics of atmospheric species
[AD-A277372] p 3773 N94-32338
AIRLINE OPERATIONS
Planning of air crew schedules
[ISBN-0-315-86506-7] p 3914 N94-32074
FAA aviation forecasts, fiscal years 1994-2005
[AD-A277808] p 3566 N94-33016
AIRPORTS
Determining the bearing capacity of flexible airfield pavements using a heavy weight deflectometer
[ISBN-0-315-86210-6] p 3587 N94-31710
The 1993 aviation system capacity plan
[AD-A276958] p 3575 N94-32620
ALASKA
The Northern Plains MSATT Meeting, and a call for a field-oriented successor to MSATT
p 3947 N94-33210
ALBEDO
Monoenergetic neutral particle transport in semi-infinite media
[AD-A277155] p 3870 N94-32368
Fine resolution atmospheric sulfate model driven by operational meteorological data: Comparison with observations
[DE94-002994] p 3766 N94-32691
Temporal and spatial mapping of atmospheric dust opacity and surface albedo on Mars
p 3947 N94-33211
ALBUMINS
Characterization and utilization of opiate-like hibernation factors
[AD-A278136] p 3794 N94-33098
ALCOHOLS
Heterogeneous catalytic process for alcohol fuels from syngas
[DE94-008729] p 3667 N94-32583
ALDEHYDES
Ligand intermediates in metal-catalyzed reactions
[DE94-008713] p 3638 N94-32887
ALFALFA
The properties of sunflecks in a flexible plant canopy, and their relationship to turbulence
p 3782 N94-31775
Dry deposition of PAN to grassland vegetation
[DE94-005111] p 3768 N94-32894
ALGAE
NORSMAP 1989: Norwegian remote sensing spectroscopy for mapping and monitoring or algal blooms and pollution p 3744 N94-31856
Removal of CO2 from flue gases by algae
[DE94-008039] p 3766 N94-32703
ALGEBRA
An algebraic view on Rosetta
[CL-93-02] p 3841 N94-31391
Multiparameter quantum groups and multiparameter R-matrices
[CWI-AM-R9307] p 3846 N94-32106
Algebraic functions for recognition
[AD-A276803] p 3846 N94-32167
Quantum homogeneous spaces, duality, and quantum 2-spheres
[CWI-AM-R9309] p 3857 N94-32192
Some problems of applied algebra
[CWI-AM-R9306] p 3847 N94-32204
N(exp n(n-1)/2)-state R-matrix related with U(sub q)(sl(n)) algebra at q(exp 2N) = 1
[DE94-608140] p 3902 N94-32247
A high-speed linear algebra library with automatic parallelism p 3828 N94-32440
ALGORITHMS
Implanting algorithms on parallel machines
[TELECOM-93-D-017] p 3823 N94-31099
Feasibility and stability results for constrained stable generalized predictive control
[MATHS-REPT-A-203] p 3828 N94-31158
Fast autodidactic adaptive equalization algorithms
[TELECOM-93-E-018] p 3670 N94-31174
On the use of genetic algorithms to solve the time-table problem
[REPT-90-060-REV] p 3829 N94-31176
The ant system: An autocatalytic optimizing process
[REPT-91-016-REV] p 3824 N94-31177
Concepts and environment
[REPT-93-032] p 3829 N94-31186
A worst-case analysis of two approximate algorithms for the symmetric travelling salesman problem
[REPT-93-036] p 3840 N94-31187
Techniques for increasing the robustness of iterative algorithms for multi-resources location problems
[REPT-93-037] p 3809 N94-31188
Exact solution of the single machine scheduling problem with earliness and flow time penalties
[REPT-93-038] p 3809 N94-31189
A worst-case analysis of an approximate algorithm for finding the minimum hamiltonian cycle on paths
[REPT-93-042] p 3809 N94-31192
Design and analysis of scalable parallel algorithms
[AD-A276255] p 3809 N94-31251
Feature discovery in gray level imagery for one-class object recognition
[DE94-005268] p 3671 N94-31267
Algorithms and structures for real-time signal processing
[AD-A276101] p 3810 N94-31277
Analysis of ionospheric parameters in Europe and creation of the prediction algorithm
[AD-A276342] p 3771 N94-31326
A parallel implementation of the column subtraction algorithm
[AD-A275922] p 3810 N94-31343
Proving theorems of the Lambek calculus of order 2 in polynomial time
[CT-93-05] p 3842 N94-31393
Identification of polynomial and rational NARMAX models
[RR-483] p 3842 N94-31413
Parallel structured optimization algorithms for inverse problems
[AD-A276053] p 3811 N94-31443
A hierarchical approach to test generation for CMOS VLSI circuits
[ISBN-9-09-005449-9] p 3689 N94-31535
Solution of the incompressible Navier-Stokes equations in general coordinates by Krylov subspace and multigrid methods
[REPT-93-64] p 3703 N94-31660
Algorithms and parallel architectures for laser acoustic imaging
[ISBN-0-315-86466-4] p 3716 N94-31797
Lattice geometrodynamics p 3857 N94-31825
Compiler techniques for managing data motion
[AD-A276514] p 3918 N94-31930
Hierarchical mixtures of experts and the EM algorithm
[AD-A276516] p 3814 N94-31932
On the convergence of stochastic iterative dynamic programming
[AD-A276517] p 3815 N94-31933
Principal component analysis with missing data and its application to object modeling
[AD-A276644] p 3845 N94-31939
Large-scale shape optimization: Numerical methods, parallel algorithms, and applications to aerodynamic design p 3815 N94-31966
Recursive analysis of matrix scattering functions
[AD-A277264] p 3845 N94-32018
On an adaptation method for dense, 2D, C-type grids
[W-9321] p 3706 N94-32045
Automated detection of ship tracks in multispectral satellite data
[AD-A276697] p 3746 N94-32119
High-performance speech recognition using consistency modeling
[AD-A276775] p 3679 N94-32185
Undiscounted Markov decision chains with partial information; an algorithm for computing a locally optimal periodic policy
[TW-93-10] p 3851 N94-32205
An algorithm for probabilistic, totally-ordered temporal projection
[AD-A277341] p 3817 N94-32257
Stochastic realization of a Gaussian stochastic control system
[CWI-BS-R9320] p 3852 N94-32350
The p-q-r-medial axis algorithm requires only local operations
[CWI-BS-R9317] p 3849 N94-32507
Production of terrain data: Optical radar complementarity p 3750 N94-32540
Bounds on least-squares four-parameter sine-fit errors due to harmonic distortion and noise
[DE94-007859] p 3849 N94-32653
Overview of shock physics codes for armor analysis
[DE94-008948] p 3739 N94-32842
Parallel supercomputing: Advanced methods, algorithms, and software for large-scale linear and nonlinear problems
[DE94-008446] p 3836 N94-32992
Finding all periods and initial palindromes of a string in parallel
[AD-B175089] p 3827 N94-33002
Noise cancellation for CELP voice encoders in an F/A-18 noise environment
[AD-A277652] p 3683 N94-33026
Machine assisted implementation of complex algorithms and labor intensive software, closing report
[AD-A277662] p 3821 N94-33027
Theory and application of image enhancement
[AD-A277896] p 3821 N94-33031
Fast nonsupervised 3D registration of PET and MR images of the brain
[TELECOM-93-C-006] p 3798 N94-33069
Multiple-valued programmable logic array minimization by solution space search
[AD-A278033] p 3821 N94-33090
Mixed 0-1 programming by lift-and-project in a branch-and-cut framework
[AD-A278045] p 3822 N94-33183
Convergence results for the EM approach to mixtures of experts architectures
[AD-A276801] p 3852 N94-33276
ALIGNMENT
Automatic resonator alignment and power stabilization of high power C02 lasers
[ISBN-0-315-77217-4] p 3714 N94-31472
Special test equipment and fixturing for MSAT reflector assembly alignment p 3606 N94-33316
ALKALI METALS
Metal ion complexation by ionizable crown ethers
[DE94-008301] p 3661 N94-32847
ALKALINE EARTH METALS
Properties of doped and undoped (Ca,Sr)CuO2 thin films
[DE94-007230] p 3905 N94-32785
ALKYL COMPOUNDS
New molecular-based routes to binary main group metal sulfides
[AD-A277005] p 3900 N94-32003
Processable, chemical routes to binary metal sulfides
[AD-A277006] p 3642 N94-32004
Group 12 thiolates: Syntheses, characterization and decomposition pathways
[AD-A277055] p 3900 N94-32011
Ignition delays, heats of combustion, and reaction rates of aluminum alkyl derivatives used as ignition and combustion enhancers for supersonic combustion
[NASA-CR-189581] p 3638 N94-32868
ALKYNES
New developments in second-order nonlinear optical polymeric materials
[AD-A277409] p 3658 N94-32578
ALLOYING
Defect-solute interactions near irradiation grain boundaries
[DE94-006215] p 3641 N94-31627
On the formation of muon- and zeta-phases in Ag-Al system by mechanical alloying
[DE94-007125] p 3645 N94-32636
ALLOYS
Metal induced embrittlement
[DE94-007450] p 3640 N94-31325
The new Metals and Alloys Indexes, search manual: A phase diagram research tool
[DE94-005371] p 3643 N94-32098
ALPHA PARTICLES
Mechanisms of formation and of de-excitation in the reaction Mg-24 + C-12 yields 9 alpha at 35MeV per nucleon
[ISBN-0-315-86746-9] p 3867 N94-31749
Collisional and chaotic transport of energetic particles in toroidal plasma
[DE94-006504] p 3889 N94-31787
Basic principles approach for studying nonlinear Alfven wave-alpha particle dynamics
[DE94-007112] p 3891 N94-32664
ALTERNATING CURRENT
Modal analysis of multiterminal high voltage direct current transmission
[DE94-006426] p 3691 N94-31785

Analytic formulation for the ac electrical conductivity in two-temperature, strongly coupled, overdense plasma: FORTRAN subroutine
[DE94-009466] p 3893 N94-32915
Stabilization method of A.C. arc plasma
[DE94-757268] p 3893 N94-32916

ALTERNATING DIRECTION IMPLICIT METHODS
An efficient three-dimensional Poisson solver for SIMD high-performance-computing architectures p 3823 N94-31120
Flutter analysis of a supersonic cascade in time domain using an ADI Euler solver
[NASA-TM-105625] p 3739 N94-32883

ALTIMETERS
The effects of altimeter sampling characteristics: Some Geosat examples
[AD-A276899] p 3747 N94-32214

ALTITUDE
Drop size distributions and related properties of fog for five locations measured from aircraft
[NASA-CR-4585] p 3787 N94-33065

ALUMINIDES
Structure, stability, and mechanical properties of intermetallic phases
[DE94-009178] p 3647 N94-32852

ALUMINUM
Anodized aluminum on LDEF p 3592 N94-31017
Interfacial behaviour: Wettability in SiC(sub p) metal matrix composites
[ISBN-0-315-87206-3] p 3621 N94-31835
An experimental study of void formation during aluminum solidification in reduced gravity p 3667 N94-31944
Compositions and chemical bonding in ceramics by quantitative electron energy-loss spectrometry
[DE94-007208] p 3659 N94-32640
Influence of volume fraction of component materials and interlayer bond strength on fracture toughness of multi-layer Al 6090-25 volume percent SiCp and Al 5182 laminates
[DE94-007141] p 3626 N94-32665
Evaluation of the Hughes conversion coating touch-up pen
[AD-A278398] p 3664 N94-33166

ALUMINUM ALLOYS
Shock tube ignition and combustion of aluminum/magnesium alloy particles in oxygen at high pressure p 3631 N94-31286
Microstructures and mechanical properties of Al3Ti-based alloys: Analysis in single phase and multiphase systems
[ONERA-NT-1993-6] p 3640 N94-31420
Powder metallurgical processing of fibre reinforced aluminium composites
[PB94-148285] p 3620 N94-31688
Acceptance criteria for weld defects in aluminium weldments
[PB94-138575] p 3735 N94-31841
Cracking induced in small fretting: Application to the case of aeronautical aluminum alloys
[ECL-92-50] p 3735 N94-31870
Acoustic emission from crack growth in 7050 aluminum and 7075 aluminum as a function of temperature and heat treatment
[DREP-CRS-93-15] p 3642 N94-31871
Effects of frequency and amplitude variations of superimposed minor loading sequences on the corrosion fatigue behavior of aircraft structural aluminum alloys p 3578 N94-31957
Work hardening behavior in aluminum alloy 2090
[DE94-007036] p 3643 N94-32064
Fatigue testing of 2024-T3 material after four cycles of PMB stripping
[AD-A276926] p 3644 N94-32237
Study of type 2 and 3 anodized Al 5052-0 in aqueous DS2 solutions
[AD-A276960] p 3644 N94-32240
Continuous measurement of aging response in aluminum alloys by eddy current methods
[AD-A277233] p 3644 N94-32371
A state variable material model for superplastic titanium-6 percent Al-4 percent V p 3644 N94-32498
Liquid-assisted diffusion bonding of NiAl
[DE94-008687] p 3645 N94-32522
Boron and hydrogen in Ni3Al. Part 2: Mechanical testing of bicrystals
[DE94-007441] p 3904 N94-32606
On the formation of muon- and zeta-phases in Ag-Al system by mechanical alloying
[DE94-007125] p 3645 N94-32636
Calculations of nonspherically averaged charge densities for substitutionally disordered alloys
[DE94-008293] p 3646 N94-32754
Phase relationships and stability of the (mu)- and (zeta)-phases in the Ag-Al-X (X=Zn, Ga, Ge) systems
[DE94-009391] p 3648 N94-33270

ALUMINUM ARSENIDES
A 1-picosecond InGaAs photodetector for operation at 1300-1600 nm
[AD-A275959] p 3895 N94-31350
High speed, strained layer, multiquantum well, GaInAsP and GaAs lasers and heterostructures
[AD-A277287] p 3719 N94-32608

ALUMINUM GALLIUM ARSENIDES
High-performance GaAs/AlGaAs optical phase modulators for microwave/photonic integrated circuits
[DE94-006361] p 3688 N94-31483
Epitaxial liftoff technology onto processed silicon foundry wafers
[AD-A277116] p 3900 N94-31985
Large-diameter InGaAs/AlGaAs vertical-cavity surface-emitting lasers with low threshold current density fabricated using a simple chemical etch process
[AD-A277733] p 3721 N94-33003
Characteristics of III-V semiconductor devices at high temperature
[NASA-TM-106574] p 3697 N94-33052

ALUMINUM GRAPHITE COMPOSITES
The impact of LDEF results on the space application of metal matrix composites p 3595 N94-31034

ALUMINUM OXIDES
Evaluation of nondestructive inspection techniques for quality control of alumina-ceramic housing components
[AD-A276220] p 3730 N94-31065
Processing of novel nanoparticle dispersion strengthened ceramics for improved mechanical performance
[AD-A275965] p 3649 N94-31276
Cost-effective ceramic machining: Summary of three-body wear experiments
[DE94-007757] p 3650 N94-31354
Reliability analysis of structural ceramics subjected to biaxial flexure p 3650 N94-31454
Joining of alumina by vacuum brazing
[VTT-TIED-1495] p 3724 N94-31656
Fatigue crack propagation and fractography of 3Y-TZP and ZTA
[ISBN-0-315-86561-X] p 3736 N94-31912
High-temperature deformation and fracture toughness of duplex ceramic microstructures p 3653 N94-31945
Oriented Si and Ge nanocrystals formed in Al2O3 by ion implantation and annealing
[DE94-005593] p 3901 N94-32172
Processing and characterization of functionally gradient ceramic materials
[AD-A277154] p 3657 N94-32367
Frictional behavior and adhesion of Ag and Au films applied to aluminum oxide by oxygen-ion assisted Screen Cage Ion Plating (SCIP)
[NASA-TM-106522] p 3647 N94-32931
Stabilized alumina/ethanol colloidal dispersion for seeding high temperature air flows
[NASA-TM-106591] p 3713 N94-32983
Perfluoropolyalkylether decomposition on catalytic aluminas
[NASA-TM-106547] p 3617 N94-33021
Interface engineering in oxide fiber/oxide matrix composites
[AD-A277672] p 3627 N94-33029
Development of materials for spectral hole burning applications
[AD-A278408] p 3909 N94-33324

AMBIGUITY
Generation of the ambiguity function for ultra wideband radar waveforms
[AD-A277913] p 3684 N94-33261

AMBIPOLAR DIFFUSION
Radar scattering from the summer polar mesosphere: Theory and observations p 3772 N94-32077

AMIDES
Intramolecular charge transfer complexes as fluorescence probes for UV and visible light induced acrylate polymerization
[AD-A277129] p 3657 N94-32381

AMINES
Reactions of electrophilic maleic anhydride and epoxy groups with nucleophilic functionalities such as carboxyl, hydroxyl, and amine groups. Polymer Technology Publication series no. 16
[PB94-135589] p 3648 N94-31069
Design of new polymers to improve radiation stability of plastic scintillators
[DE94-008220] p 3652 N94-31764
Microstructure of copolymers containing disperse red 1 and methyl methacrylate
[AD-A277140] p 3660 N94-32722

AMMONIA
Chemisorbed-molecule potential-energy surfaces and electronically-stimulated processes
[DE94-007932] p 3719 N94-32603
Enhanced thermal capacity aerogels summary report, FY 1993
[DE94-008888] p 3639 N94-33260

AMORPHOUS MATERIALS
Ion-beam-driven amorphization of Ca2La8(Si4)6O2 single crystals
[DE94-006219] p 3895 N94-31307
The effects of amorphous layer regrowth on carbon activation in GaAs and InP
[DE94-006290] p 3899 N94-31634
Deposition of DLC via intense ion beam ablation
[DE94-005583] p 3651 N94-31650
Reversible optical storage in azo polymers
[AD-A277109] p 3654 N94-31980
Isomeric poly(benzophenone)s: Synthesis of highly crystalline poly (4, 4 foot-benzophenone) and amorphous poly (2, 5-benzophenone), a soluble poly (p-phenylene) derivative
[AD-A277261] p 3655 N94-32017
Anomalous small angle x ray scattering studies of amorphous metal-germanium alloys
[DE94-007258] p 3900 N94-32065
On the formation of muon- and zeta-phases in Ag-Al system by mechanical alloying
[DE94-007125] p 3645 N94-32636
Anisotropic phase separation through the metal-insulator transition in amorphous Mo-Ge and Fe-Ge alloys
[DE94-007259] p 3646 N94-32795
Compilation of diamond-like carbon properties for barriers and hard coatings
[DE94-008231] p 3661 N94-32803
Electron energy dependence of amorphization in Zr3Fe
[DE94-008459] p 3906 N94-32875
Interface controlled amorphization of crystalline Ni/Ti multilayers
[DE94-008685] p 3906 N94-32884
Irradiation-induced phase transformations in zirconium alloys
[DE94-008484] p 3648 N94-32993
Fundamental studies in crack initiation
[AD-A278387] p 3741 N94-33356

AMORPHOUS SILICON
Experimental and theoretical studies of hydrogenated amorphous semiconductor alloys and superlattices
[AD-A276159] p 3686 N94-31079
Hydrogenated amorphous silicon (a-Si:H) based gamma camera: Monte Carlo simulations
[DE94-007042] p 3795 N94-31323
In-situ characterization of growth and interfaces in a-Si:H devices
[DE94-000291] p 3760 N94-31812
Research on the stability, electronic properties, and structure of a-Si:H and its alloys
[DE94-000292] p 3899 N94-31813
Research on stable, high-efficiency amorphous silicon multijunction modules
[DE94-000298] p 3695 N94-32680
Large-area, triple-junction a-Si alloy production scale-up
[DE94-006856] p 3762 N94-32765

AMPLIFICATION
Short-pulse, high-intensity lasers at Los Alamos
[DE94-007545] p 3720 N94-32760

AMPLIFIERS
Universal signal conditioning amplifier p 3699 N94-32460
Analysis and design of a high speed, wide range stepwise tunable optical filter/amplifier
[PB94-149572] p 3698 N94-33169

AMPLITUDE MODULATION
Pulse-splitting and AM-FM conversion in a nonlinear dispersive medium
[AD-A277041] p 3861 N94-32262

AMPTE (SATELLITES)
Computer modeling of active experiments in space plasmas p 3890 N94-31927

ANALOG CIRCUITS
Study of continuous-time and mixed analog-digital operators
[TELECOM-93-E-010] p 3687 N94-31170
VLSI implementation of stray insensitive switched capacitor composite operational amplifiers
[AD-A276461] p 3687 N94-31240
Hierarchical fault catalog process for diagnosis of analog circuits
[ETN-94-95730] p 3689 N94-31571

ANALOG DATA
An analog preprocessing architecture for high-speed analog-to-digital conversion
[AD-A276737] p 3807 N94-32163

ANALOG TO DIGITAL CONVERTERS
An analog preprocessing architecture for high-speed analog-to-digital conversion
[AD-A276737] p 3807 N94-32163

A flexible IBM-PC based data acquisition system for nuclear physics experiments
[USIP-92-02] p 3922 N94-32856

ANALOGS
The Northern Plains MSATT Meeting, and a call for a field-oriented successor to MSATT
p 3947 N94-33210

ANALYTICAL CHEMISTRY
Fiber optic chemical sensors
[AD-A277128] p 3881 N94-32380
Time-resolved analytical methods for liquid/solid interfaces
[DE94-008352] p 3637 N94-32826

ANALYZERS
Post-calibration correction for rotating-analyzer ellipsometer with optical fiber bundle detection system
[AD-A277329] p 3881 N94-32280

ANATOMY
Interactive reconstruction of anatomical structures with free-form surfaces
[TELECOM-93-E-002] p 3794 N94-31195

ANCHORS (FASTENERS)
Use of a pitch adjustable foot restraint system: Operator strength capability and load requirements
[NASA-TP-3477] p 3805 N94-33050

ANESTHESIA
Development and enhancement of a model of performance and decision making under stress in a real life setting
[AD-A276029] p 3799 N94-31440

ANGLE OF ATTACK
Tip effects on the vortex wake of an axisymmetric body at angle of attack p 3570 N94-31907
Active control for fin buffet alleviation
[AD-A276844] p 3586 N94-32224
An experimental study of the flowfield on a semispan rectangular wing with a simulated glaze ice accretion
[NASA-CR-195301] p 3571 N94-32475
Control of low-speed turbulent separated flow over a backward-facing ramp
[NASA-TM-109740] p 3573 N94-33071
Installed F/A-18 inlet flow calculations at 30 degrees angle-of-attack: A comparative study
[NASA-CR-195297] p 3573 N94-33119
A new method for calculating wing along aerodynamics to angle of attack 180 deg
[AD-A277965] p 3574 N94-33263

ANGULAR DISTRIBUTION
Energy and angular distributions of secondary ions during electronic sputtering of nonconducting surfaces
[ETN-94-95756] p 3865 N94-31516
Monoenergetic neutral particle transport in semi-infinite media
[AD-A277155] p 3870 N94-32368

ANGULAR MOMENTUM
Accretion disks around black holes
p 3928 N94-31117
The dynamical settling of warped disks and angular momentum transport in galaxies p 3928 N94-31121
Observations of accretion and angular momentum regulation in young circumstellar disks and the implications for planetary formation p 3928 N94-31122
Evolution of vaporizing pulsars p 3929 N94-31128
A study of angular momentum loss in binaries using the free Lagrange method p 3931 N94-31134
Evolution of protoplanetary disks with dynamo magnetic fields p 3931 N94-31135
Theory of protostellar accretion disks
p 3931 N94-31136
Trajectory planning for space manipulators
[AD-A277229] p 3611 N94-32369

ANGULAR RESOLUTION
The Los Alamos National Laboratory precision double crystal spectrometer
[DE94-008075] p 3713 N94-32706

ANHYDRIDES
Reactions of electrophilic maleic anhydride and epoxy groups with nucleophilic functionalities such as carboxyl, hydroxyl, and amine groups. Polymer Technology Publication series no. 16
[PB94-135589] p 3648 N94-31069

ANIMALS
From animals to animats
[AD-A277427] p 3802 N94-33241

ANISOTROPIC MEDIA
Ultrasonic tomography in fiber-reinforced composite materials p 3620 N94-31565

ANISOTROPIC SHELLS
A separation technique for asymptotic-numeric solution for general shells of revolution p 3736 N94-31961

ANISOTROPY
Radiation from an aperture into an anisotropic plasma half-space p 3885 N94-31205
Strongly anisotropic s-wave versus d-wave gap in cuprate superconductors: Evidence and theory
[DE94-007579] p 3904 N94-32746
Anisotropic phase separation through the metal-insulator transition in amorphous Mo-Ge and Fe-Ge alloys
[DE94-007259] p 3646 N94-32795

ANNEALING
Ionizing radiation effects on silicon test structures
[DE94-006060] p 3865 N94-31607
Oriented Si and Ge nanocrystals formed in Al2O3 by ion implantation and annealing
[DE94-005593] p 3901 N94-32172
Stability and precipitation kinetics in Si(1-y)C(y)/Si and Si(1-x-y)Ge(x)C(y)/Si heterostructures prepared by solid phase epitaxy
[DE94-006589] p 3902 N94-32296
Femtosecond probe-probe transmission studies of LT-grown GaAs near the band edge
[DE94-006660] p 3904 N94-32634
Compositions and chemical bonding in ceramics by quantitative electron energy-loss spectrometry
[DE94-007208] p 3659 N94-32640
Gettering of metal impurities by cavities in silicon
[DE94-005248] p 3645 N94-32672
Surface probes of porous toluene/water ices: Adsorption kinetics and annealing spectra measured by second harmonic generation
[DE94-007564] p 3637 N94-32743

ANNIHILATION REACTIONS
Time-dependent behavior of active galactic nuclei with pair production p 3929 N94-31125
B lifetimes at CDF
[DE94-006650] p 3866 N94-31669
Study of associated gauge boson production at D0: W gamma production
[DE94-006951] p 3866 N94-31670
Temperature dependence of the exciton-exciton annihilation rate constant in poly(di-n-hexylsilane)
[DE94-005584] p 3655 N94-32102

ANNUAL VARIATIONS
Regional sources of error growth in the National Meteorological Center's medium-range forecast model
p 3781 N94-31554
Seasons and chaos in population dynamics
p 3912 N94-31897
Forecasters handbook for the Philippine Islands and surrounding waters
[AD-A277993] p 3787 N94-33089
Controls on the CO2 seasonal cycle
p 3950 N94-33227
The influence of thermal inertia on Mars' seasonal pressure variation and the effect of the weather component p 3952 N94-33238
Diurnal, seasonal and solar activity variations of F-region parameters
[AD-A278106] p 3776 N94-33285

ANODES
X ray pulse considerations and electron flow in high voltage diodes
[AD-A277301] p 3868 N94-32044
High power switch design for the Nova upgrade laser (Project HERCULES: High Energy Research Concerning the Ultimate Lifetime of Experimental Switches)
[DE94-007921] p 3719 N94-32654

ANODIC COATINGS
Study of type 2 and 3 anodized Al 5052-0 in aqueous DS2 solutions
[AD-A276960] p 3644 N94-32240

ANODIZING
Anodized aluminum on LDEF p 3592 N94-31017

ANOMALIES
Spacecraft environmental anomalies expert system
[AD-A277962] p 3612 N94-33262
The Galileo high gain antenna deployment anomaly
p 3607 N94-33319

ANTARCTIC REGIONS
High frequence and automatic link establishment (HF and ALE) radio propagation test to Antarctica
[AD-A277730] p 3682 N94-33001

ANTENNA ARRAYS
Predicting antenna parameters from antenna physical dimensions
[AD-A276442] p 3672 N94-31300
Radar rainfall measurements from space
p 3782 N94-31889
Proceedings of the 1993 Antenna Applications Symposium, volume 1
[AD-A277202] p 3676 N94-32049
Proceedings of the 1993 Antenna Applications Symposium, volume 2
[AD-A277203] p 3677 N94-32050
Optical processing of MMW for agile beamsteering and beamforming
[AD-A277161] p 3880 N94-32068
Processing and characterization of functionally gradient ceramic materials
[AD-A277154] p 3657 N94-32367
The 20 GHz circularly polarized, high temperature superconducting microstrip antenna array
[NASA-CR-195097] p 3683 N94-33083
INSAT-2A and 2B development mechanisms
p 3803 N94-33293

ANTENNA DESIGN
Low sidelobe reflector antenna design for communications
[AD-A276079] p 3673 N94-31463
The development of active integrated antennas and a design methodology
[ISBN-0-315-86119-3] p 3675 N94-31708
Applied Computational Electromagnetics Society Journal, volume 9, number 1, March 1994
[AD-A276753] p 3679 N94-32183
Processing and characterization of functionally gradient ceramic materials
[AD-A277154] p 3657 N94-32367
Broadband, high-power, 2-30 MHz, twin-whip antenna. Computer and 1/10-scale model design study
[AD-A277619] p 3682 N94-32971
Reconfigurable Array of Radiating Elements (RARE) controlled by light
[NASA-CR-195828] p 3684 N94-33073
The 20 GHz circularly polarized, high temperature superconducting microstrip antenna array
[NASA-CR-195097] p 3683 N94-33083

ANTENNA FEEDS
Theoretical and experimental study of microstrip-to-slot line uniplanar transition
[NASA-TM-106566] p 3696 N94-32905

ANTENNA RADIATION PATTERNS
Predicting antenna parameters from antenna physical dimensions
[AD-A276442] p 3672 N94-31300
Formulation of time-domain planar near-field measurements without probe correction
[AD-A276380] p 3672 N94-31371
Proceedings of the 1993 Antenna Applications Symposium, volume 1
[AD-A277202] p 3676 N94-32049
Proceedings of the 1993 Antenna Applications Symposium, volume 2
[AD-A277203] p 3677 N94-32050
Using TSAR with the post-processing far-field option
[DE94-006615] p 3679 N94-32188
Particle-In-Cell (PIC) code simulation results and comparison with theory scaling laws for photoelectron-generated radiation
[DE94-006132] p 3695 N94-32662

ANTICOAGULANTS
Oxide pigments in water: The colloid-chemical point of view
[PB94-148616] p 3633 N94-31591

ANTIFERROMAGNETISM
Synthesis, characterization, phase diagrams and superconducting, and normal state magnetic properties of La(2-x)Sr(x)CuO4 (0 is less than or equal to x which is less than or equal to 0.08) and electrochemically oxidized La(2-x)Sr(x)CuO(4 + delta) (0 is less than or equal to x which is less than or equal to 0.33, 0 is less than or equal to delta which is less than or equal to 0.12)
[DE94-005260] p 3895 N94-31087

ANTIKNOCK ADDITIVES
Fuel property effects on engine combustion processes
[DE94-005529] p 3631 N94-31153

ANTIMISSILE DEFENSE
Basic and applied studies of the ram accelerator as a hypervelocity projectile launcher
[AD-A277392] p 3602 N94-32286
Vulnerability assessment of a space based weapon platform electronic system exposed to a thermonuclear weapon detonation
[DE94-007229] p 3611 N94-32667

ANTIPROTONS
F0-975, A0-980 as eye-witnesses of confinement
[PB94-147105] p 3868 N94-31923
Antiproton production in heavy ion collisions
[DE94-007552] p 3870 N94-32271
Studies of jet production with the D0 detector
[DE94-008271] p 3873 N94-32780

ANTIREFLECTION COATINGS
The role of defects in laser damage of multilayer coatings
[DE94-006731] p 3714 N94-31269
Sol-gel coatings for high power laser optics: Past, present, and future
[DE94-007240] p 3718 N94-32252

ANXIETY
An exploratory study of neuro linguistic programming and communication anxiety
[AD-A277756] p 3682 N94-32986
Stress-induced enhancement of the startle reflex
[AD-A278414] p 3802 N94-33327

APERTURES
Radiation from an aperture into an anisotropic plasma half-space p 3885 N94-31205
Transverse mode analysis of hole-coupled free-electron lasers
[ETN-94-96019] p 3715 N94-31532
Aperture excitation of electrically large, lossy cavities
[PB94-145711] p 3675 N94-31683

APOLLO 11 FLIGHT
Apollo 11 highlights
[NASA-TM-109763] p 3800 N94-31820

APPLICATION SPECIFIC INTEGRATED CIRCUITS
A miniaturized ASIC-based multichannel scaler instrument
[DE94-007222] p 3807 N94-32783
Ceramic and metal composite circuit-board-level technology for application specific electronic modules (ASEM)
[AD-A277961] p 3630 N94-33180
The impact of ASIC devices on the SEU vulnerability of space-borne computers
[AD-A278134] p 3808 N94-33252

APPLICATIONS OF MATHEMATICS
Cumulative reports and publications through December 31, 1993
[NASA-CR-194889] p 3806 N94-33286

APPLICATIONS PROGRAMS (COMPUTERS)
Symbolic derivation of Runge-Kutta methods
[MATHS-REPT-A-205] p 3840 N94-31160
Air Force Space Command satellite orbit predictor using parallel virtual machines
[AD-A276316] p 3601 N94-31298
Adaptive control of a robot in Cartesian coordinates: Analysis and implementation
[ISBN-0-315-86493-1] p 3831 N94-31798
WHIPICE — computer program for analysis of aircraft deicing
[NASA-TM-109749] p 3574 N94-31803
Lattice geometrodynamics p 3857 N94-31825
ITS version 3.0: Powerful, user-friendly software for radiation modelling
[DE94-006607] p 3678 N94-32113
MICA, a facility to achieve portability for message-passing and dynamic memory management in FORTRAN
[DE94-006692] p 3807 N94-32147
Low altitude near-the-horizon propagation: A comparison between RPO and M-layer
[AD-A277358] p 3679 N94-32282
Assembly flow simulation of a radar p 3823 N94-32431
A systems approach to computer-based training p 3823 N94-32436
Advanced CFD methodology for fast transients encountered in nonlinear combustion instability problems. Volume 2: User's guide
[NASA-CR-191352] p 3637 N94-32694
SOLGAS refined: A computerized thermodynamic equilibrium calculation tool
[DE94-009021] p 3913 N94-32846
METCAN demonstration manual, version 1.0
[NASA-TM-105607] p 3626 N94-32858
A software architecture for multidisciplinary applications: Integrating task and data parallelism
[NASA-CR-194896] p 3820 N94-32928
Snowmelt forecasting. Further cold regions development of operational hydrological forecasting, volume 2
[AD-A278123] p 3757 N94-33269
Structuring Z specifications with views
[AD-A277618] p 3822 N94-33279

APPROACH CONTROL
Flight technical error for category B non-precision approaches and missed approaches using non-differential GPS for course guidance
[PB94-142734] p 3576 N94-31680

APPROXIMATION
Multivariate spline approximation
[AD-A276034] p 3842 N94-31441
Universal approximation in p-mean by neural networks
[W-9320] p 3832 N94-31821
Solution of the average-passage equations for the incompressible flow through multiple-blade-row turbomachinery
[AD-A276515] p 3583 N94-31931
On the relationship between generalization error, hypothesis complexity, and sample complexity for radial basis functions
[AD-A276802] p 3851 N94-32142
Multiserver queues with impatient customers
[CWI-BS-R9319] p 3835 N94-32198
Approximation theory and computational methods for the identification and control of distributed parameter systems
[AD-A277335] p 3848 N94-32244
Polynomial interpolation and approximation of real functions. 2: Symmetrical interpolation for the triangle
[AD-A277345] p 3848 N94-32245
Numerical optimization techniques in neural network training p 3838 N94-33158

AQUEOUS SOLUTIONS
Biocatalytic processing polymers in supercritical fluids
[AD-A276120] p 3651 N94-31510
Oxide pigments in water: The colloid-chemical point of view
[PB94-148616] p 3633 N94-31591
Preparation of catalyst particles using methods of colloid chemistry. Part 1: Preparation of silica particles from alcohol solutions
[PB94-135597] p 3634 N94-31679
Study of type 2 and 3 anodized Al 5052-0 in aqueous DS2 solutions
[AD-A276960] p 3644 N94-32240
Recovery of carboxylic acids at pH greater than pKa
[DE94-007030] p 3636 N94-32376

ARABIAN SEA
Deep water studies of CTD data
[AD-A277741] p 3791 N94-33176

ARAGONITE
The pH of Mars p 3950 N94-33225

ARC DISCHARGES
Arcing in space structures in low Earth orbit
[NASA-CR-194223] p 3694 N94-32478
Arc-heater performance research
[NASA-CR-195821] p 3912 N94-32774

ARC HEATING
Arc-heater performance research
[NASA-CR-195821] p 3912 N94-32774
Development of lightweight ceramic ablators and arc-jet test results
[NASA-TM-108798] p 3617 N94-33117

ARC WELDING
Correlation of flux composition and inclusion characteristics with submerged arc weld metal properties in HY-100 steel
[AD-A277040] p 3726 N94-32261

ARCHITECTURE
Compiler techniques for managing data motion
[AD-A276514] p 3918 N94-31930

ARCHITECTURE (COMPUTERS)
An expert system architecture for heterogeneous domains: A case-study in the legal field
[ETN-94-96012] p 3830 N94-31546
Delft Ising computing engine
[PB94-148251] p 3806 N94-31587
The future of open architecture process control systems
[DE94-006163] p 3830 N94-31623
Algorithms and parallel architectures for laser acoustic imaging
[ISBN-0-315-86486-4] p 3716 N94-31797
Real-time control and application to robotics: Hardware and software architectures
[ISBN-0-315-87192-X] p 3833 N94-31876
An analysis of instruction-cached SIMD computer architecture
[AD-A276519] p 3806 N94-31934
An analog preprocessing architecture for high-speed analog-to-digital conversion
[AD-A276737] p 3807 N94-32163
MULTIGRAPH: An architecture for model-based programming. Model-based program synthesis for parallel computing. PREMOS: Programming environment for model-based program synthesis, version 01.00.00
[AD-A276949] p 3817 N94-32219
Parallel processing for differencing and histogramming
[AD-A277080] p 3826 N94-32274
An information system organized as stratified hypermedia
[TR-93-12] p 3918 N94-32289
Massively parallel systems design for real-time embedded applications
[AD-A277256] p 3826 N94-32323
The Operator Shell: A means of privilege distribution under Unix
[DE94-007566] p 3826 N94-32356
Studies of an optical multi-processor interconnect
[AD-A277093] p 3881 N94-32392
Common modeling system for digital simulation p 3823 N94-32429
Construction of a parallel processor for simulating manipulators and other mechanical systems
[NASA-CR-191327] p 3826 N94-32482
Gigabits to the Desktop: Installing tomorrow's networks today
[DE94-007701] p 3827 N94-32646
Development of a low-latency scalar communication routine on message-passing architectures
[DE94-007061] p 3827 N94-32683
Toroidal computer memory for serial and parallel processors
[AD-D016144] p 3807 N94-32978
Modular neural network architectures p 3838 N94-33156
Investigation of modularly configured attached processors with intelligent memories
[AD-A278418] p 3839 N94-33330

ARIANE LAUNCH VEHICLE
Scattering of a random acoustic field by an infinite cylinder: Application to the modelization of the acoustic environment of the 'Ariane 5' launcher scale-model using experimental data
[ONERA-NT-1993-11] p 3860 N94-31226

ARID LANDS
Arid regions and wind erosion p 3780 N94-31005
Climatic evolution and desertization p 3780 N94-31009
Use of SPOT and ERS-1 SAR data to study the tectonic and climatic history of arid regions p 3752 N94-32550

ARITHMETIC
Extensional realizability
[ML-93-18] p 3856 N94-31408

ARM (ANATOMY)
Geometric structure of the adaptive controller of the human arm
[AD-A276797] p 3834 N94-32152

ARMED FORCES (UNITED STATES)
Interagency Advanced Power Group: Steering Group meeting minutes
[DE94-007951] p 3761 N94-32701
Medical problems in high mountain environments. A handbook for medical officers
[AD-A278095] p 3798 N94-33268

ARMENIA
Station climatic summaries: China, the former USSR, and Mongolia
[AD-A276548] p 3784 N94-32057

ARMOR
Overview of shock physics codes for armor analysis
[DE94-008948] p 3739 N94-32842

ARSENATES
Inorganic materials for anomalous-dispersion phase-matched second harmonic generation: Rubidium titanyl arsenate isomorphs, Rb(Ti(1-2x)Ln(x)Nb(x))OAsO4
[DE94-006141] p 3899 N94-31847

ARSENIC COMPOUNDS
Tetraalkyldiarsines as potential precursors for electronic materials: Synthesis and characterization of various iso-propyl arsenic compounds
[AD-A277003] p 3900 N94-32001

ARTERIOSCLEROSIS
Incompressible viscous flow in tubes with occlusions
[ISBN-0-315-75467-2] p 3704 N94-31778

ARTIFICIAL INTELLIGENCE
OTTER 3.0 reference manual and guide
[DE94-007457] p 3829 N94-31315
Developing the Multimedia User Interface Component (MUSIC) for the Icarus Presentation System (IPS)
[AD-A276341] p 3810 N94-31335
An active computer supported medium for distributed planning in enterprises
[ETN-94-95738] p 3829 N94-31372
Proceedings of the International Workshop on Artificial Intelligence Applications in Solar-Terrestrial Physics
[PB94-142064] p 3832 N94-31808
Hierarchical mixtures of experts and the EM algorithm
[AD-A276516] p 3814 N94-31932
Application of Artificial Intelligence to the DoD Corporate Information Management (CIM) program
[AD-A276656] p 3834 N94-32061
Translucent procedures, abstraction without opacity
[AD-A276877] p 3817 N94-32213
High-speed data search p 3923 N94-32441
The limits of intelligence in design
[DE94-004668] p 3819 N94-32668
Model-based reconfiguration: Diagnosis and recovery
[NASA-CR-4596] p 3820 N94-32776
Translating an AI application from Lisp to Ada: A case study
[NASA-TM-103845] p 3820 N94-32906
From animals to animats
[AD-A277427] p 3802 N94-33241

ARTIFICIAL SATELLITES
Air Force Space Command satellite orbit predictor using parallel virtual machines
[AD-A276316] p 3601 N94-31298
General-relativistic celestial mechanics. 4: Theory of satellite motion
[PB94-147782] p 3601 N94-31769
Testing for preferred-frame effects in gravity with artificial Earth satellites
[PB94-148459] p 3610 N94-31771

Design, characterization, and control of the NASA three degree of freedom reaction compensation platform
p 3605 N94-33304

ASPECT RATIO
The small-scale topology of a 2:1 aspect-ratio elliptic jet
p 3699 N94-31184
Response of a cantilevered plate in supersonic flow
[AD-A277487] p 3580 N94-33107

ASSEMBLIES
Assembly flow simulation of a radar
p 3823 N94-32431
Special test equipment and fixturing for MSAT reflector assembly alignment
p 3606 N94-33316

ASSEMBLY
Fractional-factorial process development techniques
[DE94-005580] p 3690 N94-31593

ASSESSMENTS
GRAFTED - GRAphical fault tree EDitor: A fault tree description program for target vulnerability/survivability analysis. User manual
[AD-A277067] p 3818 N94-32390

ASTEROIDS
Keeping that youthful look --- impact cratering of Venus
p 3941 N94-31112

ASTRODYNAMICS
Planetesimal dynamics in the vicinity of a growing protoplanet
p 3935 N94-31926
The chemical and dynamical evolution of the galaxy
p 3936 N94-31950

ASTROMETRY
General-relativistic celestial mechanics. 4: Theory of satellite motion
[PB94-147782] p 3601 N94-31769

ASTRONAUTS
Legal regime of human activities in outer space law
p 3599 N94-31431
Defying gravity
[NASA-TM-109747] p 3667 N94-31884

ASTRONOMICAL MODELS
Fireworks in velocity and configuration space applied to cosmology
[USIP-93-90] p 3927 N94-31086
Nonthermal accretion disk models around neutron stars
p 3931 N94-31139
Gas dynamics for accretion disk simulations
p 3932 N94-31144
Evolution of stars and winds in the starburst galaxy M82
p 3934 N94-31758
The chemical and dynamical evolution of the galaxy
p 3936 N94-31950

ASTRONOMICAL PHOTOGRAPHY
A new high-speed IR camera system
p 3713 N94-32459

ASTRONOMICAL SPECTROSCOPY
Cometary molecules
p 3935 N94-31869
High sensitivity and resolution decimetric spectroscope: Preliminary analysis of solar bursts
[INPE-5537-TDI/525] p 3954 N94-33080
SNC meteorites and their implications for reservoirs of Martian volatiles
p 3947 N94-33209

ASTRONOMY
Construction of visual representations and time-space organization of resources in astronomy
[ISBN-0-315-86694-2] p 3925 N94-31914

ASTROPHYSICS
Physical chemistry of molecules and grains in space
[AD-A276037] p 3932 N94-31280
Various magnet options for Delta launched version of ASTROMAG
[DE94-006292] p 3955 N94-31635
Nuclear physics and astrophysics
[DE94-007168] p 3939 N94-33147

ASYMMETRY
A worst-case analysis of two approximate algorithms for the symmetric travelling salesman problem
[REPT-93-036] p 3840 N94-31187
Baryogenesis from a primordial lepton asymmetry
[PB94-145166] p 3868 N94-31921

ASYMPTOTES
Kaplan-Meier estimators of interpoint distance distributions for spatial point processes
[CWI-BS-R9315] p 3846 N94-32107

ASYMPTOTIC METHODS
Doubly asymptotic approximations: Theoretical and numerical analyses
[ONERA-NT-1993-7] p 3840 N94-31231
The finite element method with asymptotic self-similar solutions
p 3736 N94-31904
A separation technique for asymptotic-numeric solution for general shells of revolution
p 3736 N94-31961

ASYMPTOTIC PROPERTIES
Heteroclinic attractors: Time averages and moduli of topological conjugacy
[W-9318] p 3844 N94-31690
Bifurcation and deterministic chaos in dynamic systems
[REPT-93-047] p 3911 N94-31893
Asymptotic behavior of dynamic systems
p 3911 N94-31894
Penetrable wedge analysis
[AD-A277219] p 3845 N94-32022
Kaplan-Meier estimators of interpoint distance distributions for spatial point processes
[CWI-BS-R9315] p 3846 N94-32107

ASYMPTOTIC SERIES
Stirling's formula and approximations for n(factorial) and the middle ratio
[REPT-93-73] p 3843 N94-31642
Finite-part integrals and the Euler-Maclaurin expansion
[DE94-006539] p 3844 N94-31665
Stability of tearing modes in tokamak plasmas
[DE94-009205] p 3892 N94-32911

ATLANTIC OCEAN
Low frequency variability observed in the tropical Atlantic Ocean
p 3778 N94-30991
Operations summary for the convection and moisture experiment (CAMEX)
[NASA-TM-108445] p 3786 N94-33004
Evolution of upwelling fronts off the coast of Portugal
[NASA-CR-195692] p 3790 N94-33045
Quantitative modeling of bottom morphology and subbottom properties
[AD-A278142] p 3790 N94-33062
Cruise report: Oceanus 250 leg 4 high resolution profiler survey for the North Atlantic Tracer Release Experiment, 25 March - 24 April, 1992
[AD-A277935] p 3791 N94-33245

ATMOSPHERIC ATTENUATION
Optical and image transmission through desert atmospheres
[AD-A276022] p 3742 N94-31496
Field studies of raindrop oscillations with applications to radar meteorology
p 3782 N94-31743
Atmospheric propagation effects through natural and man-made obscurants for visible to MM-wave radiation
[AD-A276919] p 3679 N94-32235
Low altitude near-the-horizon propagation: A comparison between RPO and M-layer
[AD-A277358] p 3679 N94-32282

ATMOSPHERIC BOUNDARY LAYER
Research in marine boundary layer intermittency
[AD-A276076] p 3701 N94-31460
Boundary-layer cumulus over land: Some observations and conceptual models
[DE93-040820] p 3781 N94-31597
Surface fluxes of trace gases derived from convective-layer profiles
p 3704 N94-31774
A non-local model for prediction of the probability density function of turbulent fluctuations in boundary-layer flows
p 3706 N94-32076
High resolution properties of the marine atmospheric boundary layer
[DE94-006235] p 3774 N94-32736
An evaluation of RAMS radiation schemes by field measurements
[DE94-008053] p 3767 N94-32750
Coastal boundary layer and refractivity measurements using the ground-based high resolution interferometer sounder (GB-HIS)
[AD-A277980] p 3683 N94-33159

ATMOSPHERIC CHEMISTRY
Sources and wells of minor atmospheric constituents of climatic importance
p 3770 N94-31008
Cloud studies seen from a physical chemist's perspective
[DE94-008059] p 3771 N94-31527
Evaluation of sulfate aerosol optical depths over the North Atlantic and comparison with satellite observations
[DE94-005457] p 3746 N94-32100
Formation of gas-phase peroxides in a rural atmosphere: An interpretation of the recent SOS/SERON field results
[DE94-002995] p 3766 N94-32692
Biospheric effects of a large extraterrestrial impact: Case study of the Cretaceous/Tertiary boundary crater
[NASA-CR-195827] p 3942 N94-32740
Surface probes of porous toluene/water ices: Adsorption kinetics and annealing spectra measured by second harmonic generation
[DE94-007564] p 3637 N94-32743
Quantified estimates of total GWPs for greenhouse gases taking into account tropospheric chemistry
[DE94-007846] p 3768 N94-32817
Dry deposition of PAN to grassland vegetation
[DE94-005111] p 3768 N94-32894
A correlated k-distribution model of the heating rates for atmospheric mixtures of H2O, CO2, O3, CH4, and N2O in the 0-2500 cm(exp -1) wave number region at altitudes between 0 and 60 km
[DE94-005136] p 3775 N94-32895
A model for the evolution of CO2 on Mars
p 3946 N94-33205
Mars atmospheric loss and isotopic fractionation by solar-wind-induced sputtering and photochemical escape
p 3947 N94-33208
How well was total ozone abundance inferred with Mariner 9
p 3947 N94-33212
Escape of Mars atmospheric carbon through time by photochemical means
p 3948 N94-33214

ATMOSPHERIC CIRCULATION
Subtropical Climates and Their Evolution: From Space-Based Observation to Modelling
[ISBN-2-85-428333-3] p 3776 N94-30981
Energetic and general circulation
p 3777 N94-30983
Tropical squall lines
p 3778 N94-30992
Effects of the deep tropical convection in the large scale atmospheric flow
p 3778 N94-30994
Desert aerosols: Sources, transports, and impacts determined by remote sensing
p 3770 N94-31003
Regional sources of error growth in the National Meteorological Center's medium-range forecast model
p 3781 N94-31554
Numerical simulations of monsoon rainfall with the NRL/NCSU regional nested grid model
p 3782 N94-31791
The evolution of jet features during the 1993 east coast white hurricane: A case study using the global spectral model
[AD-A277217] p 3783 N94-32021
Coordination of mesoscale meteorological research between ASL and European group
[AD-A276730] p 3784 N94-32162
Variational elliptic solver for atmospheric applications
[DE94-007725] p 3774 N94-32647
Diagnostic studies of climate variability
[DE94-003629] p 3767 N94-32711
Wind-speed measurements with a scanning elastic-backscatter lidar
[DE94-004974] p 3785 N94-32726
High resolution properties of the marine atmospheric boundary layer
[DE94-006235] p 3774 N94-32736
A long-term simulation of surface fluxes and soil moisture
[DE94-006661] p 3774 N94-32772
Statistical intercomparison of global climate models: A common principal component approach
[DE94-008671] p 3768 N94-32882
Performance of a new wind updating system for a prognostic meteorological model in the environs of Mexico City
[DE94-006243] p 3786 N94-32937
Stationary eddies in the Mars general circulation as simulated by the NASA-Ames GCM
p 3944 N94-33192
Eddy transport of water vapor in the Martian atmosphere
p 3949 N94-33221

ATMOSPHERIC COMPOSITION
Carbon balance in a forest ecosystem
p 3770 N94-31007
Sources and wells of minor atmospheric constituents of climatic importance
p 3770 N94-31008
Climatic evolution and desertization
p 3780 N94-31009
The ozone and the physico-chemical processes in tropical regions
p 3770 N94-31010
Cloud studies seen from a physical chemist's perspective
[DE94-006059] p 3771 N94-31527
Time-dependent behavior of Mount Pinatubo aerosol
[DE94-001877] p 3764 N94-31601
Surface fluxes of trace gases derived from convective-layer profiles
p 3704 N94-31774
One: Microphysics of frost metamorphism: Applications to Triton and Mars. Two: A global analysis of the ozone deficit in the upper stratosphere and lower mesosphere. Three: The diabatic circulation in the stratosphere as diagnosed from Microwave Limb Sounder data
p 3942 N94-31975
Ionization probes of molecular structure and chemistry
[DE94-007605] p 3872 N94-32643
A correlated k-distribution model of the heating rates for atmospheric mixtures of H2O, CO2, O3, CH4, and N2O in the 0-2500 cm(exp -1) wave number region at altitudes between 0 and 60 km
[DE94-005136] p 3775 N94-32895
Effects of long-term elevated atmospheric CO2 concentrations on Pinus ponderosa
[DE94-008832] p 3769 N94-32966
Mars: Past, Present, and Future. Results from the MSATT Program, part 1
[NASA-CR-194279] p 3943 N94-33190
Mars atmospheric dust properties: A synthesis of Mariner 9, Viking, and Phobos observations
p 3945 N94-33200

Magmatic volatiles and the weathering of Mars
p 3946 N94-33201
Regional sedimentological variations among dark crater floor features: Toward a model for modern eolian sand distribution on Mars p 3946 N94-33203
A model for the evolution of CO2 on Mars
p 3946 N94-33205
Mars atmospheric loss and isotopic fractionation by solar-wind-induced sputtering and photochemical escape
p 3947 N94-33208
SNC meteorites and their implications for reservoirs of Martian volatiles p 3947 N94-33209
Studies of atmospheric dust from Viking IR thermal mapper data p 3948 N94-33216
Carbonate formation on Mars: Latest experiments
p 3950 N94-33231
Obliquity variation in a Mars climate evolution model
p 3951 N94-33236
Carbonates, surfates, phosphates, nitrates, and organic materials: Their association in a Martian meteorite
p 3952 N94-33239
High resolution molecular spectroscopy of atmospheric species
[AD-A278382] p 3776 N94-33351

ATMOSPHERIC CORRECTION
European Imaging Spectroscopy Aircraft Campaign
[ESA-SP-360] p 3743 N94-31853
The European Imaging Spectroscopy Airborne Campaign (EISAC). Data takes and evaluation programme: An overview p 3743 N94-31854
Ground based radiometric and atmospheric measurements p 3744 N94-31855

ATMOSPHERIC DENSITY
Thermospheric modeling accuracies using F10.7 and Ap
[AD-A277355] p 3773 N94-32337
Possible test of ancient dense Martian atmosphere
p 3947 N94-33206

ATMOSPHERIC EFFECTS
Atmospheric effects assessment program: Ionospheric sounding
[AD-A276447] p 3770 N94-31303
Statistics of time averaged atmospheric scintillation
[DE94-006998] p 3747 N94-32249
Biospheric effects of a large extraterrestrial impact: Case study of the Cretaceous/Tertiary boundary crater
[NASA-CR-195827] p 3942 N94-32740

ATMOSPHERIC GENERAL CIRCULATION MODELS
Energetic and general circulation
p 3777 N94-30983
The climate of the Mediterranean basin: Its sensitivity to global change p 3778 N94-30993
Modeling of the continental biosphere
p 3770 N94-31011
Treatment of cloud radiative effects in general circulation models
[DE94-001864] p 3764 N94-31600
Short term teleconnections associated with an individual tropical cyclone
[AD-A277210] p 3783 N94-32019
Physical basis for climate change models
[DE94-003827] p 3767 N94-32712
Use of cloud observations and mesoscale meteorology models to evaluate and improve cloud parameterizations
[DE94-003610] p 3785 N94-32717
A long-term simulation of surface fluxes and soil moisture
[DE94-006661] p 3774 N94-32772
Statistical intercomparison of global climate models: A common principal component approach
[DE94-006871] p 3768 N94-32882

ATMOSPHERIC HEAT BUDGET
Energetic and general circulation
p 3777 N94-30983

ATMOSPHERIC HEATING
Carbon dioxide abatement as a differential game
[DE94-722023] p 3765 N94-32590
A correlated k-distribution model of the heating rates for atmospheric mixtures of H2O, CO2, O3, CH4, and N2O in the 0-2500 cm(exp -1) wave number region at altitudes between 0 and 60 km
[DE94-005136] p 3775 N94-32895
A model for the evolution of CO2 on Mars
p 3946 N94-33205
The wavelength dependence of Martian atmospheric dust radiative properties p 3950 N94-33228
TRMM-related research: Tropical rainfall and energy analysis experiment
[NASA-CR-195834] p 3787 N94-33286

ATMOSPHERIC IONIZATION
Lightning-induced coupling of the radiation belts to geomagnetically conjugate ionospheric regions
p 3772 N94-31773

ATMOSPHERIC MODELS
Subtropical Climates and Their Evolution: From Space-Based Observation to Modelling
[ISBN-2-85-428333-3] p 3776 N94-30981
Climatologic flux in tropical ocean
p 3777 N94-30985
Carbon balance in a forest ecosystem
p 3770 N94-31007
Analysis of ionospheric parameters in Europe and creation of the prediction algorithm
[AD-A276342] p 3771 N94-31326
The High-Frequency Benchmark propagation program
[AD-A276323] p 3672 N94-31334
Regional sources of error growth in the National Meteorological Center's medium-range forecast model
p 3781 N94-31554
Cumulus convection parameterization and numerical modelling of moist atmospheres p 3783 N94-31989
Use of Air Force cloud cover data to evaluate and improve cloud forecasts and parameterizations in mesocale meteorological models
[AD-A277384] p 3784 N94-32054
Evaluation of sulfate aerosol optical depths over the North Atlantic and comparison with satellite observations
[DE94-005457] p 3746 N94-32100
Atmospheric structure simulation: An autoregressive model for smooth geophysical power spectra with known autocorrelation function
[AD-A276691] p 3773 N94-32118
Recommendations for meteorological data collection during physiological field studies
[AD-A276834] p 3901 N94-32153
Tropical cyclone forecasters reference guide. 5: Numerical track forecast guidance
[AD-A277318] p 3785 N94-32278
A critical examination of stellar atmosphere theory for metal-poor K-giant stars p 3927 N94-32308
Thermospheric modeling accuracies using F10.7 and Ap
[AD-A277355] p 3773 N94-32337
Proceedings of the Ninth Annual Pacific Climate (PACLIM) Workshop
[DE94-003024] p 3766 N94-32693
Physical basis for climate change models
[DE94-003827] p 3767 N94-32712
An evaluation of RAMS radiation schemes by field measurements
[DE94-008053] p 3767 N94-32750
Climate effects of anthropogenic sulfate: Simulations from a coupled chemistry/climate model
[DE94-004352] p 3767 N94-32789
Parameterizing atmosphere-land surface exchange for climate models with satellite data: A case study for the Southern Great Plains CART site
[DE94-005109] p 3775 N94-32874
Performance of a new wind updating system for a prognostic meteorological model in the environs of Mexico City
[DE94-006243] p 3786 N94-32937
Forecasters handbook for the Philippine Islands and surrounding waters
[AD-A277993] p 3787 N94-33089
Transport and diffusion in turbulent fields modeling and measurements techniques
[AD-A278114] p 3769 N94-33110
A model for the evolution of CO2 on Mars
p 3946 N94-33205
Possible test of ancient dense Martian atmosphere
p 3947 N94-33206
Groundbased monitoring of Martian atmospheric opacity p 3947 N94-33207
Mars atmospheric loss and isotopic fractionation by solar-wind-induced sputtering and photochemical escape
p 3947 N94-33208
Studies of atmospheric dust from Viking IR thermal mapper data p 3948 N94-33216
Eddy transport of water vapor in the Martian atmosphere p 3949 N94-33221
Numerical simulation of thermally induced near-surface flows over Martian terrain p 3949 N94-33223
Obliquity variation in a Mars climate evolution model
p 3951 N94-33236
Simultaneous laboratory measurements of CO2 and H2O adsorption on palagonite: Implications for the Martian climate and volatile reservoir p 3952 N94-33240

ATMOSPHERIC MOISTURE
Cloud studies seen from a physical chemist's perspective
[DE94-006059] p 3771 N94-31527
Cumulus convection parameterization and numerical modelling of moist atmospheres p 3783 N94-31989
Operations summary for the convection and moisture experiment (CAMEX)
[NASA-TM-108445] p 3786 N94-33004

ATMOSPHERIC OPTICS
Matter-radiation interactions in the atmosphere
p 3776 N94-30998
Design and early results of the sodium-layer laser guide star adaptive optics experiment at the Lawrence Livermore National Laboratory
[DE94-006653] p 3926 N94-32189
Groundbased monitoring of Martian atmospheric opacity p 3947 N94-33207
Temporal and spatial mapping of atmospheric dust opacity and surface albedo on Mars
p 3947 N94-33211

ATMOSPHERIC PHYSICS
Airborne instruments p 3757 N94-31006
Modeling of the continental biosphere
p 3770 N94-31011
Spectroscopic study of the molecular collisions (hydrogen-nitrogen and hydrogen-oxygen) at energies of several MeV
[ISBN-0-315-86794-9] p 3867 N94-31753
One: Microphysics of frost metamorphism: Applications to Triton and Mars. Two: A global analysis of the ozone deficit in the upper stratosphere and lower mesosphere. Three: The diabatic circulation in the stratosphere as diagnosed from Microwave Limb Sounder data
p 3942 N94-31975
Theoretical studies on ionospheric irregularities and ion diode performance
[AD-A277115] p 3772 N94-31984
Atmospheric structure simulation: An autoregressive model for smooth geophysical power spectra with known autocorrelation function
[AD-A276691] p 3773 N94-32118
Time-resolved IR spectroscopy, energy transfer, and state-to-state collision dynamics of atmospheric species
[AD-A277372] p 3773 N94-32338
Spatial correlation of ionospheric variability
[AD-A278105] p 3776 N94-33041

ATMOSPHERIC PRESSURE
Possible test of ancient dense Martian atmosphere
p 3947 N94-33206
Controls on the CO2 seasonal cycle
p 3950 N94-33227
Simultaneous laboratory measurements of CO2 and H2O adsorption on palagonite: Implications for the Martian climate and volatile reservoir p 3952 N94-33240

ATMOSPHERIC RADIATION
Treatment of cloud radiative effects in general circulation models
[DE94-001864] p 3764 N94-31600
Water vapor from sunradiometry in comparison with microwave and balloon-sonde measurements at the Southern Great Plains ARM Site
[DE94-007479] p 3786 N94-32759

ATMOSPHERIC REFRACTION
Coastal boundary layer and refractivity measurements using the ground-based high resolution interferometer sounder (GB-HIS)
[AD-A277980] p 3683 N94-33159

ATMOSPHERIC SCATTERING
Multiple scattering of polarized radiation in planetary atmospheres
[ETN-94-96018] p 3674 N94-31551
Performance statistics bulletin. High latitude meteor scatter propagation October, November, December 1990, January 1991
[AD-A276693] p 3676 N94-31998
Radar scattering from the summer polar mesosphere: Theory and observations p 3772 N94-32077
Performance statistics bulletin. High latitude metor scatter propagation, February, March, April, May 1992
[AD-A276667] p 3677 N94-32083
Performance statistics bulletin. High latitude meteor scatter propagation February, March, April, May 1991
[AD-A276723] p 3678 N94-32158
Performance statistics bulletin. High latitude meteor scatter propagation October, November, December 1991, January 1992
[AD-A276724] p 3678 N94-32159
Performance statistics bulletin. High latitude meteor scatter propagation, November and December 1989, and January 1990
[AD-A276688] p 3680 N94-32297
Performance statistics bulletin. High latitude meteor scatter propagation
[AD-A276694] p 3680 N94-32298
Performance statistics bulletin. High latitude meteor scatter propagation
[AD-A276695] p 3680 N94-32299
Performance statistics bulletin. High latitude meteor scatter propagation
[AD-A276696] p 3680 N94-32300
Aerosols scattering and near-infrared observations of the Martian surface p 3946 N94-33204
Groundbased monitoring of Martian atmospheric opacity p 3947 N94-33207

ATMOSPHERIC SOUNDING
Eurocap program-ebre station
[AD-A277044] p 3772 N94-32007
Gyrotrons and free electron lasers for atmospheric sensing
[AD-A277281] p 3718 N94-32406
Water vapor from sunradiometry in comparison with microwave and balloon-sonde measurements at the Southern Great Plains ARM Site
[DE94-007479] p 3786 N94-32759
Operations summary for the convection and moisture experiment (CAMEX)
[NASA-TM-108445] p 3786 N94-33004
Participation in the scientific activities of the Waves in Space Plasma (WISP) project
[NASA-CR-195903] p 3894 N94-33113
EUROCAP program
[AD-A278084] p 3776 N94-33184
An evaluation of three GPS receivers for use in the GPS sounder
[AD-A278157] p 3577 N94-33253

ATMOSPHERIC TEMPERATURE
Diagnostic studies of climate variability
[DE94-003629] p 3767 N94-32711
Mars atmospheric dust properties: A synthesis of Mariner 9, Viking, and Phobos observations
p 3945 N94-33200

ATMOSPHERIC TURBULENCE
Optical and image transmission through desert atmospheres
[AD-A276022] p 3742 N94-31496
The properties of sunflecks in a flexible plant canopy, and their relationship to turbulence
p 3782 N94-31775
Aircraft incident report: In-flight turbulence encounter and loss of portions of the elevators, China Airlines Flight CI-012, McDonnell Douglas MD-11-P, Taiwan Registration B-150 about 20 miles east of Japan, 7 December 1992
[PB94-910403] p 3576 N94-32938
Phase-only correction of scintillated laser beams: Downrange experimental results
[AD-A277778] p 3722 N94-33282

ATOMIC CLUSTERS
Metal clusters: Dynamics and structure
[AD-A276842] p 3643 N94-32091
Metal cluster-rare gas van der Waals complexes: Microscopic models of physisorption
[DE94-008134] p 3873 N94-32797

ATOMIC COLLISIONS
Results from the H1 experiment at HERA
[PB94-145174] p 3868 N94-32008
Analysis of forward and inverse problems in chemical dynamics and spectroscopy
[DE94-007607] p 3635 N94-32140

ATOMIC ENERGY LEVELS
Electronic and nuclear factors in intramolecular charge and excitation transfer processes
[DE94-006598] p 3870 N94-32178

ATOMIC EXCITATIONS
Mechanisms of formation and of de-excitation in the reaction Mg-24 + C-12 yields 9 alpha at 35MeV per nucleon
[ISBN-0-315-86746-9] p 3867 N94-31749
Production and detection of metastable atomic oxygen
[ISBN-0-315-87364-7] p 3868 N94-31915
Cooling and trapping of neutral atoms
[AD-A276957] p 3870 N94-32360

ATOMIC INTERACTIONS
High-temperature study of O+H2CO yields OH+HCO
[DE94-006837] p 3864 N94-31321

ATOMIC PHYSICS
Spectroscopy and atomic physics in EBIT and SuperEBIT
[DE94-006050] p 3864 N94-31508
Atomic and molecular data needs for fusion
[DE94-006555] p 3870 N94-32177

ATOMIC SPECTRA
Diamagnetism in helium Rydberg atoms
[ETN-94-96015] p 3865 N94-31549

ATOMIC STRUCTURE
The relationship of the electronic structures of semiconductor surfaces and heterostructures to crystal growth
[AD-A276465] p 3896 N94-31473
Collective and quasiparticle excitations in light Pb isotopes
[ETN-94-96014] p 3865 N94-31548
Various magnet options for Delta launched version of ASTROMAG
[DE94-006292] p 3955 N94-31635
Double rotation NMR studies of zeolites and aluminophosphate molecular sieves
[DE94-007032] p 3866 N94-31637
The adsorption of sulfate on gold(111) in acidic aqueous media: Adlayer structural inferences from infrared spectroscopy and scanning tunneling microscopy
[AD-A276643] p 3642 N94-31997
A new-type of long-range restructuring of ordered metal surfaces induced by lateral adsorbate interactions: Iodide on AU(110) electrodes
[AD-A276633] p 3643 N94-32060
Amorphous/crystalline structure and phase transformations in metastable semiconducting Ge(1-x)Sn(x)
[DE94-006659] p 3901 N94-32115
Charge-dependent atomic-scale structures of high-index and (110) gold electrode surfaces as revealed by scanning tunneling microscopy
[AD-A276782] p 3869 N94-32170
Lowering the Schottky barrier at metal or silicide/Si interfaces to extend the range of infrared detectors
[AD-A277253] p 3903 N94-32322
Theoretical studies of electron transfer and optical spectroscopy
[DE94-006985] p 3871 N94-32375
Numerical simulation of quantum many-body systems
[DE94-008451] p 3912 N94-32513
Computational chemistry on parallel computers
[DE94-008106] p 3636 N94-32616
Energetics, bonding mechanism, and electronic structure of ceramic/ceramic and metal/ceramic interfaces
[DE94-008551] p 3659 N94-32656
Calculations of nonspherically averaged charge densities for substitutionally disordered alloys
[DE94-008293] p 3646 N94-32754
Occupied and unoccupied orbitals of C60 and C70
[DE94-008294] p 3873 N94-32755
Near edge x ray spectroscopy theory
[DE94-008179] p 3905 N94-32799
Characterization of nanoparticles and nanophase materials
[DE94-008348] p 3907 N94-32990
Sensitivity of electrochemical adlayer structure to the metal crystallographic orientation: Potential-independent iodide adsorption on Au(100) in comparison with other low-index surfaces
[AD-A276714] p 3909 N94-33273
Nanoscale structural changes upon electrooxidation of Au(111) as probed by potentiodynamic scanning tunneling microscopy
[AD-A276780] p 3909 N94-33275
A tandem microscopic-electrochemical examination of a charge-induced surface phase sequence: Ordered Au(110) in aqueous iodide electrolytes as probed by potentiodynamic scanning tunneling microscopy
[AD-A276905] p 3875 N94-33277

ATOMS
Cooling and trapping of neutral atoms
[AD-A276957] p 3870 N94-32360
Coherent processes in atom in strong radiation fields
[AD-A278388] p 3874 N94-33144

ATTENUATION
Arithmetic averaging: A versatile technique for smoothing and trend removal
[DE94-005274] p 3852 N94-32673

ATTITUDE (INCLINATION)
Attitude dynamics of spinning rockets in space with internal mass motion p 3601 N94-31802

ATTITUDE CONTROL
Adaptive nonlinear control of spacecraft
p 3609 N94-31564
An experimental testbed for a free-floating manipulator
[AD-A277350] p 3726 N94-32334
The ALEXIS mission recovery
[DE94-007549] p 3611 N94-32813

ATTITUDE GYROS
Chaotic attitude motion of satellites in the central gravitational field
[ISBN-0-315-78768-6] p 3610 N94-31723
Performance analysis of an integrated GPS/inertial attitude determination system
[NASA-CR-188289] p 3577 N94-32864

ATTITUDE STABILITY
Chaotic attitude motion of satellites in the central gravitational field
[ISBN-0-315-78768-6] p 3610 N94-31723

AUDIO FREQUENCIES
Acoustic window
[AD-D016171] p 3862 N94-33017

AUDIO SIGNALS
Auditory perception
[AD-A277414] p 3800 N94-32419

AUDIO VISUAL MATERIAL
Multimedia as a desktop and classroom tool
[DE94-009118] p 3807 N94-32766

AUDITORY PERCEPTION
Spectral analysis method and sample generation for real time visualization of speech
[ETN-94-95732] p 3674 N94-31573
Determination of multiple sound sources
[AD-A277379] p 3799 N94-32096
Auditory perception
[AD-A277414] p 3800 N94-32419
Mechanisms of temporal pattern discrimination by human observers
[AD-A277407] p 3801 N94-32577
Models of the neuronal mechanisms of target localization of the barn owl
[AD-A277332] p 3797 N94-32623
Three dimensional audio versus head down TCAS displays
[NASA-CR-177636] p 3576 N94-33063
Complex auditory signals
[AD-A278391] p 3862 N94-33146

AUDITORY SIGNALS
Three dimensional audio versus head down TCAS displays
[NASA-CR-177636] p 3576 N94-33063
Complex auditory signals
[AD-A278391] p 3862 N94-33146

AURORAL ABSORPTION
Performance statistics bulletin. High latitude meter scatter propagation, February, March, April, May 1992
[AD-A276667] p 3677 N94-32083
Performance statistics bulletin. High latitude meteor scatter propagation February, March, April, May 1991
[AD-A276723] p 3678 N94-32158
Performance statistics bulletin. High latitude meteor scatter propagation October, November, December 1991, January 1992
[AD-A276724] p 3678 N94-32159
Performance statistics bulletin. High latitude meteor scatter propagation, November and December 1989, and January 1990
[AD-A276688] p 3680 N94-32297
Performance statistics bulletin. High latitude meteor scatter propagation
[AD-A276694] p 3680 N94-32298
Performance statistics bulletin. High latitude meteor scatter propagation
[AD-A276695] p 3680 N94-32299
Performance statistics bulletin. High latitude meteor scatter propagation
[AD-A276696] p 3680 N94-32300
Performance statistics bulletin. High latitude meteor scatter propagation, June, July, August, September 1992
[AD-A277508] p 3685 N94-33347

AURORAL ARCS
Convection and electrodynamic signatures in the vicinity of a Sun-aligned arc: Results from the Polar Acceleration Regions and Convection Study (Polar ARCS)
p 3954 N94-31102

AURORAL SPECTROSCOPY
Spectroscopic study of the molecular collisions (hydrogen-nitrogen and hydrogen-oxygen) at energies of several MeV
[ISBN-0-315-86794-9] p 3867 N94-31753

AURORAS
The double probe electric field experiment on Freja: Description and first results
[TRITA-ALP-1993-02] p 3885 N94-31089
High frequency active auroral research program (HAARP) imager
[AD-A277469] p 3775 N94-32999
A comprehensive analysis of electron conical distributions from multi-satellite databases
[NASA-CR-195848] p 3953 N94-33047

AUSTENITE
Modeling of residual stress mitigation in austenitic stainless steel pipe girth weldment
[DE94-007184] p 3738 N94-32639

AUSTENITIC STAINLESS STEELS
Defect-solute interactions near irradiation grain boundaries
[DE94-006215] p 3641 N94-31627
Characterization of the corrosion resistance of duplex stainless steels using local current density mapping techniques
[DE94-007980] p 3646 N94-32699

AUTOCORRELATION
Atmospheric structure simulation: An autoregressive model for smooth geophysical power spectra with known autocorrelation function
[AD-A276691] p 3773 N94-32118

AUTOMATIC CONTROL
Compiler techniques for managing data motion
[AD-A276514] p 3918 N94-31930
Automated fiber pigtailing technology
[DE94-007072] p 3695 N94-32688

A novel optoelectronic system for distortion-invariant ATR
[AD-A277985] p 3884 N94-33087
Knowledge engineering for PACES, the particle accelerator control expert system p 3854 N94-33342

AUTOMATION
Automated detection of ship tracks in multispectral satellite data
[AD-A276697] p 3746 N94-32119
Automatic translation among spoken languages p 3685 N94-32437

AUTOMOBILE ENGINES
Materials development program: Ceramic technology project bibliography, 1984-1992
[DE94-009297] p 3662 N94-32935

AUTOMOBILE FUELS
Fuel property effects on engine combustion processes
[DE94-005529] p 3631 N94-31153
Scenarios for multi-unit inertial fusion energy plants producing hydrogen fuel
[DE94-006614] p 3666 N94-32114
The hydrogen hybrid option
[DE94-006733] p 3667 N94-32148

AUTOMOBILES
The hydrogen hybrid option
[DE94-006733] p 3667 N94-32148

AUTOMORPHISMS
Dynamical entropy of generalized quantum Markov chains
[PB94-148483] p 3850 N94-31590

AUTONOMOUS NAVIGATION
Contingency-tolerant robot motion planning and control p 3830 N94-31482
Safe navigation and active vision for autonomous vehicles: A purposive and direct solution p 3832 N94-31842
Robot motion vision by fixation p 3833 N94-31991
Neural models of spatial orientation in novel environments
[AD-A277383] p 3835 N94-32340
A multitasking behavioral control system for the Robotic All Terrain Lunar Exploration Rover (RATLER)
[DE94-007293] p 3835 N94-32787

AUTONOMY
From animals to animats
[AD-A277427] p 3802 N94-33241

AUTOREGRESSIVE PROCESSES
Representation, prediction and identification of cyclostationary processes: A state-space approach
[REPT-93-041] p 3850 N94-31191
Atmospheric structure simulation: An autoregressive model for smooth geophysical power spectra with known autocorrelation function
[AD-A276691] p 3773 N94-32118

AVERAGE
Heteroclinic attractors: Time averages and moduli of topological conjugacy
[W-9318] p 3844 N94-31690
Arithmetic averaging: A versatile technique for smoothing and trend removal
[DE94-005274] p 3852 N94-32673

AVIATION METEOROLOGY
Drop size distributions and related properties of fog for five locations measured from aircraft
[NASA-CR-4585] p 3787 N94-33065

AVIONICS
The maintenance of operational flight program
[AD-A276363] p 3565 N94-31367
Technologies for avionics embedded computer systems
[AD-A276364] p 3581 N94-31368
Testing Operational Flight Programs (OFP's)
[AD-A276361] p 3578 N94-31387
SATCOM feasibility study for search and rescue aircraft
[DSIS-94-01083] p 3575 N94-31902
Aerospace software engineering for advanced systems architectures
[AD-A277101] p 3581 N94-31977
Getting a handle on designing for avionics software supportability and maintainability
[AD-A276362] p 3581 N94-32055
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-navigation/communication module, volume 6
[AD-A276973] p 3590 N94-32398
A framework for developing and managing reusable avionics software
[AD-A276846] p 3582 N94-32909

AXIAL FLOW
The effect of an axial flow component on a circular cylinder wake p 3699 N94-31209
On the structure and stability of slender viscous vortices p 3700 N94-31218
Solution of the average-passage equations for the incompressible flow through multiple-blade-row turbomachinery
[AD-A276515] p 3583 N94-31931
Incorporating radial mixing in axisymmetric streamline curvature through-flow analysis
[AD-A277325] p 3706 N94-32279
Flutter analysis of a supersonic cascade in time domain using an ADI Euler solver
[NASA-TM-105625] p 3739 N94-32883

AXIAL LOADS
Reliability analysis of structural ceramics subjected to biaxial flexure p 3650 N94-31454
Contribution to the study of multiaxial fatigue under periodic or random stresses
[ISAL-92-0004] p 3734 N94-31544

AXIAL STRESS
Contribution to the study of multiaxial fatigue under periodic or random stresses
[ISAL-92-0004] p 3734 N94-31544

AXIOMS
On the independent axiomatizability of modal and intermediate logics
[ML-93-17] p 3856 N94-31407

AXISYMMETRIC BODIES
Tip effects on the vortex wake of an axisymmetric body at angle of attack p 3570 N94-31907
A separation technique for asymptotic-numeric solution for general shells of revolution p 3736 N94-31961

AXISYMMETRIC FLOW
Accretion disks around black holes p 3928 N94-31117
Simulations of the creation and motion of vortex rings
[W-9319] p 3703 N94-31691
Incorporating radial mixing in axisymmetric streamline curvature through-flow analysis
[AD-A277325] p 3706 N94-32279

AXONS
Empirical modeling for intelligent, real-time manufacture control p 3839 N94-32424

AZERBAIJAN
Station climatic summaries: China, the former USSR, and Mongolia
[AD-A276548] p 3784 N94-32057

AZO COMPOUNDS
Azo polymers for reversible optical storage. 4. Cooperative motion of rigid groups in semicrystalline polymers
[AD-A277107] p 3654 N94-31978
Reversible optical storage in azo polymers
[AD-A277109] p 3654 N94-31980
Compatibility studies of some azo polymer blends
[AD-A277141] p 3657 N94-32365
Microstructure of copolymers containing disperse red 1 and methyl methacrylate
[AD-A277140] p 3660 N94-32722

AZULENE
Energy transfer properties and mechanisms
[DE94-007403] p 3636 N94-32594

B

B STARS
Evolution of dynamo-generated magnetic fields in accretion disks around compact and young stars p 3931 N94-31138
The evolutionary status of PSR 1259-63
[DE94-007094] p 3938 N94-32503

BACILLUS
Biocatalytic processing polymers in supercritical fluids
[AD-A276120] p 3651 N94-31510

BACKGROUND NOISE
Peak detection of Swerling type targets. Part 1: Detection probabilities in white noise
[AD-A276217] p 3670 N94-31062
A Green's function approach to analysing the effects of random synaptic background activity in a model neural network
[MATHS-REPT-A-202] p 3828 N94-31157
Long transect seafloor seismic array: A component of SAMSON (Sources of Ambient Micro Seismic Ocean ic Noise)
[AD-A277009] p 3789 N94-32401
Visual processing of object velocity and acceleration
[AD-A277425] p 3801 N94-32998
The application of a radial basis function neural network for radar tracking over the sea p 3686 N94-33150

BACKSCATTERING
The development and testing of a backscatter absorption gas imaging (BAGI) system designed to image at a range of 300 m
[DE94-006192] p 3675 N94-31761
Methods for SBS threshold reduction
[AD-A276554] p 3717 N94-31936
High-resolution synthetic aperture radar observations of the Moon p 3676 N94-31952
ITS version 3.0: Powerful, user-friendly software for radiation modelling
[DE94-006607] p 3678 N94-32113
Backscatter and transmission of aerosol at UV through middle IR wavelengths
[AD-A277127] p 3718 N94-32305
MOM3D method of moments code theory manual
[NASA-CR-189594] p 3682 N94-32897
Millstone Hill radar studies of plasma waves and turbulence
[AD-A278409] p 3684 N94-33172

BACKWARD DIFFERENCING
On the error committed by stopping the Newton iteration in Runge-Kutta methods and linear multistep methods
[TW-93-13] p 3847 N94-32206

BACKWARD FACING STEPS
Backward-facing step measurements at low Reynolds number, Re(sub h)=5000
[NASA-TM-108807] p 3711 N94-33290

BACKWARD WAVES
Repetitively pulsed backward-wave oscillator investigations
[AD-A278281] p 3698 N94-33142

BACTERIA
Spectral inhomogeneity of the bacterial light-harvesting antennae: Causes and consequences
[ETN-94-96020] p 3792 N94-31533

BAKING
Conductive paints
[DE94-008508] p 3661 N94-32788

BALL BEARINGS
Torque characteristics of solid lubricated precision bearings during oscillatory motion
[AD-A278133] p 3728 N94-33061
A comparison of the performance of solid and liquid lubricants in oscillating spacecraft ball bearings p 3606 N94-33311
Development of long-life, low-noise linear bearings for atmospheric interferometry p 3606 N94-33312
Design of a high-speed reliable ball bearing p 3606 N94-33314

BALLISTIC MISSILES
Vulnerability assessment of a space based weapon platform electronic system exposed to a thermonuclear weapon detonation
[DE94-007229] p 3611 N94-32667
Integrated safety program for the Nuclear Electric Propulsion Space Test Program
[DE94-004670] p 3615 N94-32669

BALLOON-BORNE INSTRUMENTS
Low power, constant-flow air pump systems
[DE94-007463] p 3727 N94-32758
Water vapor from sunradiometry in comparison with microwave and balloon-sonde measurements at the Southern Great Plains ARM Site
[DE94-007479] p 3786 N94-32759

BANGLADESH
Recurvature dynamics of a typhoon
[AD-A276792] p 3784 N94-32164

BARENTS SEA
Prediction of the plane wave beamformed acoustic arrival structure for the 1992 Barents Sea coastal tomography test
[AD-A276741] p 3788 N94-32181
Finite-element modeling of the blockage and scattering of LG propagation
[AD-A277430] p 3775 N94-33006

BARIUM OXIDES
On the nature of striae in strontium barium niobate
[DE94-006486] p 3901 N94-32176
Processing and characterization of functionally gradient ceramic materials
[AD-A277154] p 3657 N94-32367
High T(sub c) superconductor tunnel junctions for photon detectors
[DE94-007686] p 3904 N94-32602
The path for long range conduction in high J(sub c) TlBa2Ca2Cu3O(8+x) spray-pyrolyzed deposits
[DE94-007211] p 3909 N94-33271

BARYON RESONANCE
NN-interaction in (1)S0-state: Virtual level or dibaryon resonance?
[DE94-606492] p 3869 N94-32097

BARYONS
Baryogenesis from a primordial lepton asymmetry
[PB94-145166] p 3868 N94-31921
Antiproton production in heavy ion collisions
[DE94-007552] p 3870 N94-32271
Transverse energy production with Si and Au beams at AGS energy: Towards hot and dense hadronic matter
[DE94-007178] p 3938 N94-32638
Hyperon polarization, crystal channeling, and E781 at Fermilab
[DE94-008224] p 3877 N94-32802

BASE FLOW
On the structure and stability of slender viscous vortices p 3700 N94-31218
Turbulence structure of a premixed flame in a coaxial free air jet in the presence or absence of a base flow
[ISBN-0-315-78739-2] p 3633 N94-31471
BATTERY CHARGERS
EDD-7 Electric Charge Point Meter test results
[DE94-008515] p 3696 N94-32828
BAYES THEOREM
Fault detection and isolation for the Bluebird test bed aircraft
[AD-A277979] p 3586 N94-33086
Real-time sensor data validation
[NASA-CR-195295] p 3616 N94-33099
Management of uncertainty in knowledge-based systems: A military perspective p 3854 N94-33341
BCS THEORY
A quest for a new superconducting state
[DE94-008439] p 3908 N94-32991
BEADS
Empirical modeling for intelligent, real-time manufacture control p 3839 N94-32424
BEAM INJECTION
Experimental survey of the L-H transition conditions in the D3-D tokamak
[DE94-007428] p 3891 N94-32595
BEAM INTERACTIONS
RHIC spin physics
[DE94-005452] p 3876 N94-32099
Particle diffusion from the beam-beam interaction in synchrotron colliders
[DE94-007111] p 3876 N94-32685
BEAMFORMING
Subspace estimation without eigenvectors for adaptive beamforming
[AD-A276287] p 3671 N94-31254
Optical processing of MMW for agile beamsteering and beamforming
[AD-A277161] p 3880 N94-32068
Prediction of the plane wave beamformed acoustic arrival structure for the 1992 Barents Sea coastal tomography test
[AD-A276741] p 3788 N94-32181
Digital beamforming and filtering circuit
[AD-D016142] p 3697 N94-32976
BEAMS (RADIATION)
Optical processing of MMW for agile beamsteering and beamforming
[AD-A277161] p 3880 N94-32068
BEAMS (SUPPORTS)
Random vibrations of composite beams and plates p 3735 N94-31777
Vibrational and acoustic response of ribbed plates p 3736 N94-31955
An analytical study of the vibration of beams fitted with neutralizers. Part 2: Assessment of the effects of mounting configurations
[ISVR-TR-225-PT-2] p 3740 N94-32982
BEARING (DIRECTION)
Relative motion pinwheel
[AD-D016107] p 3577 N94-32961
BEARINGS
International Space Station Alpha's bearing, motor, and roll ring module developmental testing and results p 3603 N94-33295
BEHAVIOR
From animals to animats
[AD-A277427] p 3802 N94-33241
BELARUS
Station climatic summaries: China, the former USSR, and Mongolia
[AD-A276548] p 3784 N94-32057
BEND TESTS
Strain sensing using optical fibers
[NASA-CR-195807] p 3740 N94-32940
Technology integration box beam failure study p 3628 N94-33126
Simpler J(sub Ic) test and data analysis procedures for high strength steels
[AD-A277731] p 3648 N94-33281
BENDING
Control of a flexible-link robotic arm manipulating an unknown dynamic payload p 3725 N94-31973
QUAD4 seminar
[AD-A277366] p 3818 N94-32330
Compliance measurements of chevron notched four point bend specimen
[NASA-TM-106538] p 3740 N94-32932
BENDING FATIGUE
Fatigue behavior of unidirectional pultruded composite materials
[ISBN-0-315-86425-7] p 3621 N94-31719
BENDING MOMENTS
An approximate solution for interlaminar stresses in laminated composites p 3621 N94-31901
Technology integration box beam failure study p 3628 N94-33126
BENDING VIBRATION
Microreflectance infrared study of electron-molecular vibrational coupling and lattice softness in BEDT-TTF salts
[DE94-008490] p 3907 N94-32989
BENZENE
Energy transfer properties and mechanisms
[DE94-007403] p 3636 N94-32594
Microstructure of copolymers containing disperse red 1 and methyl methacrylate
[AD-A277140] p 3660 N94-32722
Direct aromatization of methane
[DE94-008719] p 3638 N94-32888
BESSEL FUNCTIONS
Steepest descent paths for integrals defining the modified Bessel functions of imaginary order
[CWI-AM-R9303] p 3848 N94-32227
BIBLIOGRAPHIES
Space industrialization: A guide to government information
[RELEASE-1.2] p 3916 N94-31338
Aeronautical engineering: A continuing bibliography with indexes (supplement 302)
[NASA-SP-7037(302)] p 3565 N94-31342
Aeronautical engineering: A continuing bibliography with indexes (supplement 303)
[NASA-SP-7037(303)] p 3565 N94-31381
Aerospace medicine and biology: A continuing bibliography with indexes (supplement 388)
[NASA-SP-7011(388)] p 3795 N94-31414
A guide to experimental elementary particle physics literature, 1988-1992
[DE94-007445] p 3873 N94-32768
Aeronautical engineering: A continuing bibliography with indexes (supplement 304)
[NASA-SP-7037(304)] p 3566 N94-32853
Materials development program: Ceramic technology project bibliography, 1984-1992
[DE94-009297] p 3662 N94-32935
Cumulative reports and publications through December 31, 1993
[NASA-CR-194889] p 3806 N94-33286
BICRYSTALS
Boron and hydrogen in Ni3Al. Part 2: Mechanical testing of bicrystals
[DE94-007441] p 3904 N94-32606
BIDIRECTIONAL REFLECTANCE
Modeling the interaction between solar radiation and terrestrial surfaces p 3779 N94-30999
Temporal and spatial mapping of atmospheric dust opacity and surface albedo on Mars p 3947 N94-33211
BIG BANG COSMOLOGY
Fireworks in velocity and configuration space applied to cosmology
[USIP-93-90] p 3927 N94-31086
Nuclear physics and astrophysics
[DE94-007168] p 3939 N94-33147
BINARY DATA
Binary quantifiers and relational semantics
[LP-93-13] p 3855 N94-31404
Spacecraft On-Board Information Extraction Computer (SOBIEC) p 3808 N94-32433
BINARY MIXTURES
Strongly coupled ionic mixtures and the H/He EOS
[DE94-006391] p 3934 N94-31782
Measurement of viscosity, density, and gas solubility of refrigerant blends in selected synthetic lubricants
[DE94-007723] p 3653 N94-31917
Processable, chemical routes to binary metal sulfides
[AD-A277006] p 3642 N94-32004
Lubrication with binary mixtures: Liquid-liquid emulsion in elastohydrodynamics and metal forming p 3658 N94-32490
Extended-range order in glasses
[DE94-008135] p 3661 N94-32798
Analytic properties of the OCP and ionic mixtures in the strongly coupled fluid state
[DE94-008216] p 3637 N94-32801
BINARY PHASE SHIFT KEYING
Advanced satellite communication system
[NASA-CR-194211] p 3681 N94-32477
The effects of a multipath channel and interference on coherent M-PSK digital communication systems
[AD-A278158] p 3684 N94-33254
BINARY STARS
Double-lined pre-main-sequence binaries: A test of pre-main-sequence evolutionary theory p 3933 N94-31497
Winds from disks in compact binaries
[DE94-007452] p 3938 N94-32137
The evolutionary status of PSR 1259-63
[DE94-007094] p 3938 N94-32503
BINARY SYSTEMS (MATERIALS)
High temperature ductility loss in titanium alloys: A review
[DE94-006606] p 3640 N94-31345
Micromechanics and effective properties of particulate composites and fluid suspensions p 3703 N94-31744
Nonlinear effects in interfacial fracture p 3737 N94-31974
New molecular-based routes to binary main group metal sulfides
[AD-A277005] p 3900 N94-32003
Group 12 thiolates: Syntheses, characterization and decomposition pathways
[AD-A277055] p 3900 N94-32011
BINAURAL HEARING
Mechanisms of temporal pattern discrimination by human observers
[AD-A277407] p 3801 N94-32577
Models of the neuronal mechanisms of target localization of the barn owl
[AD-A277332] p 3797 N94-32623
BIOACOUSTICS
Minutes: Accredited Standards Committee on Bioacoustics, S3. US TAG for ISO/TC 43, acoustics, IEC/TC 29 electroacoustics, and ISO/TC 108/SC4 human exposure to mechanical vibration and shock
[AD-A276201] p 3795 N94-31490
BIOASSAY
Characterization and utilization of opiate-like hibernation factors
[AD-A278136] p 3794 N94-33098
BIOASTRONAUTICS
Aerospace medicine and biology: A continuing bibliography with indexes (supplement 388)
[NASA-SP-7011(388)] p 3795 N94-31414
Muscle disuse through tail-suspension: Etiology and therapeutics p 3796 N94-31746
BIOCHEMISTRY
International Journal of Quantum Chemistry, Quantum Biology Symposium number 20. Proceedings of the International Symposium on the Application of Fundamental Theory to Problems of Biology and Pharmacology
[AD-A276294] p 3792 N94-31294
Biocatalytic processing polymers in supercritical fluids
[AD-A276120] p 3651 N94-31510
Development and application of photosensitive device systems to studies of biological and organic materials
[DE94-008503] p 3793 N94-32516
Ninth International Workshop on Plant Membrane Biology
[DE94-005690] p 3794 N94-32769
BIOCONVERSION
Spectral inhomogeneity of the bacterial light-harvesting antennae: Causes and consequences
[ETN-94-96020] p 3792 N94-31533
Development of a catalytic system for gasification of wet biomass
[DE94-006216] p 3759 N94-31762
Biological conversion of synthesis gas
[DE94-000094] p 3760 N94-31811
Removal of CO2 from flue gases by algae
[DE94-008039] p 3766 N94-32703
BIODYNAMICS
Tripping over obstacles: Biomechanical analyses of how young and old try to avoid it p 3800 N94-31954
Use of a pitch adjustable foot restraint system: Operator strength capability and load requirements
[NASA-TP-3477] p 3805 N94-33050
BIOENGINEERING
Model-based scientific discovery: A study in space bioengineering p 3799 N94-31990
BIOINSTRUMENTATION
Perspectives of glucose sensing based on a charge-modulating competition reaction
[ISBN-9-09-005754-4] p 3795 N94-31652
BIOLOGICAL EFFECTS
Aerospace medicine and biology: A continuing bibliography with indexes (supplement 389)
[NASA-SP-7011(389)] p 3797 N94-32347
Aerospace medicine and biology: A continuing bibliography with indexes (supplement 385)
[NASA-SP-7011(385)] p 3797 N94-32348
High peak power microwaves: A health hazard
[AD-A277168] p 3681 N94-32576
Effects of long-term elevated atmospheric CO2 concentrations on Pinus ponderosa
[DE94-008832] p 3769 N94-32966
BIOLOGICAL EVOLUTION
Qualitative properties of two-dimensional predator-prey systems
[REPT-93-75] p 3844 N94-31644
BIOLOGICAL MODELS (MATHEMATICS)
Two models solving the increasing energy problem of the continuous Hopfield network model
[REPT-93-87] p 3843 N94-31552

Qualitative properties of two-dimensional predator-prey systems
[REPT-93-75] p 3844 N94-31644
A predator-prey model with Ivlev's functional response
[REPT-93-79] p 3844 N94-31696
Tripping over obstacles: Biomechanical analyses of how young and old try to avoid it p 3803 N94-31954
Model-based scientific discovery: A study in space bioengineering p 3799 N94-31990
On the reciprocal relationship between life histories and population dynamics
[CWI-AM-R9302] p 3793 N94-32226
The legacy of Kermack and McKendrick
[CWI-AM-R9304] p 3793 N94-32228
A cell-cycle model revisited
[CWI-AM-R9305] p 3851 N94-32229
Research and applications of a canopy reflectance model p 3747 N94-32492
Numerical model of the thermal behavior of an extremity in a cold environment including counter-current heat exchange between the blood vessels
[AD-A278099] p 3798 N94-33040
Workshop on Visual Perception: Computation and Psychophysics
[AD-A278412] p 3802 N94-33326

BIOLUMINESCENCE
Bioluminescence bathyphotometer
[AD-D016102] p 3790 N94-32959

BIOMASS
Development of a catalytic system for gasification of wet biomass
[DE94-006216] p 3759 N94-31762
Biomass power industry: Assessment of key players and approaches for DOE and industry interaction
[DE94-000238] p 3761 N94-32725
Environmental issues related to biomass: An overview
[DE94-007226] p 3767 N94-32784
Climate effects of anthropogenic sulfate: Simulations from a coupled chemistry/climate model
[DE94-004352] p 3767 N94-32789
Light utilization and photoinhibition of photosynthesis in marine phytoplankton
[DE94-005505] p 3794 N94-32896

BIOMASS ENERGY PRODUCTION
Biomass power industry: Assessment of key players and approaches for DOE and industry interaction
[DE94-000238] p 3761 N94-32725

BIOMEDICAL DATA
Interactive reconstruction of anatomical structures with free-form surfaces
[TELECOM-93-E-002] p 3794 N94-31195

BIOPHYSICS
Spectral inhomogeneity of the bacterial light-harvesting antennae: Causes and consequences
[ETN-94-96020] p 3792 N94-31533
Future directions of nonlinear dynamics in physical and biological systems. (Physica D nonlinear, volume 68, number 1)
[AD-A278085] p 3794 N94-33250

BIOPROCESSING
Biocatalytic processing polymers in supercritical fluids
[AD-A276120] p 3651 N94-31510

BIOREACTORS
Biological conversion of synthesis gas
[DE94-000094] p 3760 N94-31811

BIOSPHERE
Subtropical Climates and Their Evolution: From Space-Based Observation to Modelling
[ISBN-2-85-428333-3] p 3776 N94-30981
Modeling of the continental biosphere p 3770 N94-31011

BIOSYNTHESIS
Towards a detailed understanding of the structural variability in lignins: A new approach
[DE94-007449] p 3793 N94-32267
The magnesium chelation step in chlorophyll biosynthesis
[DE94-008727] p 3794 N94-32890

BIPOLAR TRANSISTORS
Passivation of III-V compound semiconductor based devices
[AD-A276178] p 3894 N94-31056
Reconfigurable optical switches with monolithic electrical-to-optical interfaces
[DE94-007745] p 3861 N94-32385

BIPOLARITY
Chemical vapour deposition of tungsten for the application in integrated circuits
[ISBN-9-09-005151-1] p 3641 N94-31519

BIREFRINGENCE
Azo polymers for reversible optical storage. 4. Cooperative motion of rigid groups in semicrystalline polymers
[AD-A277107] p 3654 N94-31978
High average power pulsed phase conjugate laser with birefringence correction
[DE94-006049] p 3719 N94-32659

BISMALEIMIDE
Evolution of the interface properties with temperature in the T800H/ bismaleimide composites
[ONERA-NT-1993-14] p 3619 N94-31478

BISMUTH ALLOYS
Fermi surface instability at 0.4 K in a heavy-fermion YbBiPt: SDW?
[DE94-006224] p 3899 N94-31916

BISMUTH OXIDES
High T(sub c) superconductor tunnel junctions for photon detectors
[DE94-007686] p 3904 N94-32602

BIT ERROR RATE
Control and reliability of optical networks in multiprocessors
[AD-A277385] p 3881 N94-32285

BIVARIATE ANALYSIS
Diagonal band probability distributions
[REPT-93-80] p 3851 N94-31697

BLACK HOLES (ASTRONOMY)
Accretion disks around black holes p 3928 N94-31117
Disk irradiation and light curves of x ray novae p 3929 N94-31124
Observational constraints on black hole accretion disks p 3929 N94-31126
Nonlinear calculations of the time evolution of black hole accretion disks p 3929 N94-31127
The physics of black hole x ray novae p 3932 N94-31143

BLOCK COPOLYMERS
Novel electroactive polymers and block copolymers
[AD-A276119] p 3650 N94-31509
Dynamics of block poly(styrene-co-vinylpyridine) (SVP) in solution and on silica
[AD-A277139] p 3657 N94-32364
Phase behavior, structure, and properties of model block polymers
[AD-A277530] p 3662 N94-32954

BLOCKING
Compiler techniques for managing data motion
[AD-A276514] p 3918 N94-31930
Finite-element modeling of the blockage and scattering of LG propagation
[AD-A277430] p 3775 N94-33006

BLOOD
Numerical model of the thermal behavior of an extremity in a cold environment including counter-current heat exchange between the blood vessels
[AD-A278099] p 3798 N94-33040

BLOOD CIRCULATION
Incompressible viscous flow in tubes with occlusions
[ISBN-0-315-75467-2] p 3704 N94-31778

BLOOD FLOW
Incompressible viscous flow in tubes with occlusions
[ISBN-0-315-75467-2] p 3704 N94-31778

BLOOD PLASMA
Characterization and utilization of opiate-like hibernation factors
[AD-A278136] p 3794 N94-33098

BLOOD VESSELS
Numerical model of the thermal behavior of an extremity in a cold environment including counter-current heat exchange between the blood vessels
[AD-A278099] p 3798 N94-33040

BLOWING
Control of hypersonic aerodynamic forces with surface blowing p 3567 N94-31216

BLUFF BODIES
The effect of an axial flow component on a circular cylinder wake p 3699 N94-31209

BODY CENTERED CUBIC LATTICES
Metal clusters: Dynamics and structure
[AD-A276842] p 3643 N94-32091

BODY-WING CONFIGURATIONS
Multidisciplinary optimization of high-speed civil transport configurations using variable-complexity modeling p 3578 N94-31881

BOEING 737 AIRCRAFT
Airborne Trailblazer: Two decades with NASA Langley's 737 flying laboratory
[NASA-SP-4216] p 3566 N94-32793

BOEING 767 AIRCRAFT
A comparison of military and commercial aircraft development
[AD-A276830] p 3575 N94-32168

BOILERS
Methodology for damage study of a tube-grill contact
[ECL-92-49] p 3734 N94-31562
Creep-fatigue criteria and inelastic behavior of modified 9Cr-1Mo steel at elevated temperatures
[DE94-007915] p 3642 N94-31918

BOLIDES
Possible test of ancient dense Martian atmosphere p 3947 N94-33206

BOLOMETERS
Wavelet transform of fixed pattern noise in focal plane arrays
[AD-A276963] p 3712 N94-32393

BOLTZMANN DISTRIBUTION
Fireworks in velocity and configuration space applied to cosmology
[USIP-93-90] p 3927 N94-31086

BOLTZMANN TRANSPORT EQUATION
Monoenergetic neutral particle transport in semi-infinite media
[AD-A277155] p 3870 N94-32368

BONDED JOINTS
Small cylindrical adhesive bonds
[PB94-148210] p 3651 N94-31585
Joining of alumina by vacuum brazing
[VTT-TIED-1495] p 3724 N94-31656
Bond stress-slip characteristics of FRP rebars
[AD-A277191] p 3623 N94-32070
The cyclic fatigue behaviour of adhesive joints
[AD-A277080] p 3738 N94-32351

BONDING
Interfacial behaviour: Wettability in SiC(sub p) metal matrix composites
[ISBN-0-315-87206-3] p 3621 N94-31835
Energetics, bonding mechanism, and electronic structure of ceramic/ceramic and metal/ceramic interfaces
[DE94-008551] p 3659 N94-32656

BONES
Isolating strain parameters correlated to skeletal adaptation p 3797 N94-31960

BOOLEAN ALGEBRA
A theory of conditional information with applications
[AD-A278164] p 3850 N94-33255

BOOMS (EQUIPMENT)
MSAT boom joint testing and load absorber design p 3606 N94-33315
Deployable and retractable telescoping tubular structure development p 3607 N94-33317

BOOSTER ROCKET ENGINES
Possible effect of the chlorine oxide dimer on transient ozone loss in rocket plumes
[AD-A278135] p 3616 N94-33094

BORANES
Processing boron and boron carbide thin films for protective coatings and device fabrication
[AD-A277266] p 3900 N94-32041

BORN APPROXIMATION
Structure estimation of phase objects from the diffraction near field: Microwave and model calculations
[ETN-94-95737] p 3674 N94-31608

BORON
Determination of BPSG thin-film properties using IR reflection spectroscopy of product wafers
[DE94-006591] p 3634 N94-32110
Boron and hydrogen in Ni3Al. Part 2: Mechanical testing of bicrystals
[DE94-007441] p 3904 N94-32606

BORON CARBIDES
Processing boron and boron carbide thin films for protective coatings and device fabrication
[AD-A277266] p 3900 N94-32041

BORON NITRIDES
Nucleation and growth of cubic boron nitride films produced by ion-assisted pulsed laser deposition
[DE94-007295] p 3661 N94-32796
X ray absorption study of pulsed laser deposited boron nitride films
[DE94-008295] p 3662 N94-32855

BOROSILICATE GLASS
Surface chemistry and durability of borosilicate glass
[DE94-006734] p 3656 N94-32116
Pump-probe method for investigating laser ablation and optical damage threshold mechanisms in optical materials
[DE94-008291] p 3720 N94-32753

BOSONS
Study of associated gauge boson production at D0: W gamma production
[DE94-006951] p 3866 N94-31670
Production of charginos and neutralinos for the reaction positron electron yields Z' boson yields chargino(+) (sub i) chargino(-) (sub j) or neutralino (sub i) neutralino (sub j) in SU(2) (sub L) x SU(2) (sub R) x U(1) (sub B-L)
[ISBN-0-315-87316-7] p 3867 N94-31832
F0-975, A0-980 as eye-witnesses of confinement
[PB94-147105] p 3868 N94-31923
Short coherence length superconductors: Intermediate regime between BCS and bosons
[DE94-007694] p 3904 N94-32645

BOULES
Boron and hydrogen in Ni3Al. Part 2: Mechanical testing of bicrystals
[DE94-007441] p 3904 N94-32606
BOUNDARIES
Deep water studies of CTD data
[AD-A277741] p 3791 N94-33176
BOUNDARY CONDITIONS
Boundary control of scattering p 3861 N94-31899
Solution of the average-passage equations for the incompressible flow through multiple-blade-row turbomachinery
[AD-A276515] p 3583 N94-31931
Sound scattering by cylinders of noncircular cross section
[AD-A276663] p 3861 N94-32089
Surface boundary conditions and related technical issues concerning Burnett equations for 2-D hypersonic flow
[AD-A277322] p 3706 N94-32256
A critical evaluation of methods for imposing solid-wall boundary conditions in inviscid flow
[AD-A276959] p 3707 N94-32361
The 2D deterministic radiation transport with the discontinuous finite element method
[DE94-004687] p 3849 N94-32670
A finite-difference approximate-factorization algorithm for solution of the unsteady transonic small-disturbance equation
[NASA-TP-3129] p 3572 N94-32865
BOUNDARY ELEMENT METHOD
THERM3D: A boundary element computer program for transient heat conduction problems
[DE94-008112] p 3708 N94-32709
Boundary element analysis of three-dimensional nonlinear hydrodynamics in a reduced gravity environment p 3668 N94-32715
BOUNDARY LAYER CONTROL
Study of dynamic stall phenomenon and its control using vorticity, stream function and circulation form of the unsteady Navier-Stokes equations p 3572 N94-32714
Results for the hybrid laminar flow control experiment conducted in the NASA Langley 8-foot transonic pressure tunnel on a 7-foot chord model
[NASA-TM-107582] p 3601 N94-32870
Magnetohydrodynamic boundary layer control system
[AD-D016120] p 3710 N94-32958
BOUNDARY LAYER EQUATIONS
Computation of three-dimensional compressible boundary layers to fourth-order accuracy on wings and fuselages
[NASA-CR-4269] p 3709 N94-32871
BOUNDARY LAYER FLOW
Interaction processes between the ocean and the atmosphere p 3777 N94-30987
Boundary layer study on nozzle wall at hypersonic velocities p 3569 N94-31882
A non-local model for prediction of the probability density function of turbulent fluctuations in boundary-layer flows p 3706 N94-32076
A critical evaluation of methods for imposing solid-wall boundary conditions in inviscid flow
[AD-A276959] p 3707 N94-32361
Shear flow control of cold and heated rectangular jets by mechanical tabs. Volume 1: Results and discussion
[NASA-CR-182296-VOL-1] p 3708 N94-32867
Shear flow control of cold and heated rectangular jets by mechanical tabs. Volume 2: Tabulated data
[NASA-CR-182296-VOL-2] p 3709 N94-32869
Magnetohydrodynamic boundary layer control system
[AD-D016120] p 3710 N94-32958
Transport and diffusion in turbulent fields modeling and measurements techniques
[AD-A278114] p 3769 N94-33110
The structure of high Reynolds number turbulent boundary layers, part A
[AD-A278392] p 3710 N94-33162
BOUNDARY LAYER SEPARATION
Three-dimensional velocity measurements on a 6:1 prolate spheroid at 10 deg angle of attack
[AD-A276485] p 3702 N94-31476
An experimental study of the flowfield on a semispan rectangular wing with a simulated glaze ice accretion
[NASA-CR-195301] p 3571 N94-32475
Numerical analysis of transonic wing buffet p 3586 N94-32713
Study of dynamic stall phenomenon and its control using vorticity, stream function and circulation form of the unsteady Navier-Stokes equations p 3572 N94-32714
Control of low-speed turbulent separated flow over a backward-facing ramp
[NASA-TM-109740] p 3573 N94-33071
BOUNDARY LAYER STABILITY
Compressible convection with ionization p 3911 N94-31498
BOUNDARY LAYER TRANSITION
Analysis of the photodiode boundary layer transition indicator
[DE94-005311] p 3701 N94-31268
BOUNDARY LAYERS
Development of a cascade simulation of fan-passage flow
[AD-A277234] p 3584 N94-32026
Diagnostic studies of climate variability
[DE94-003629] p 3767 N94-32711
Stability of tearing modes in tokamak plasmas
[DE94-009205] p 3892 N94-32911
Fluid mechanical measurements within the bottom boundary layer over the Northern California continental shelf during stress
[AD-A277916] p 3791 N94-33243
BOUNDARY LUBRICATION
Development and preliminary evaluation of aryl ester boundary additives for perfluoropolyethers
[NASA-TM-106603] p 3663 N94-33024
BOUNDARY VALUE PROBLEMS
Fully discrete arbitrary-order schemes for a model hyperbolic conservation law
[CRANFIELD-AERO-9307] p 3843 N94-31539
A simplified Von Neumann method for linear stability analysis
[CRANFIELD-AERO-9310] p 3843 N94-31540
Penetrable wedge analysis
[AD-A277219] p 3845 N94-32022
A stability estimate based on numerical ranges with application to a spectral discretization of a convection-diffusion equation
[TW-93-12] p 3847 N94-32200
On the error committed by stopping the Newton iteration in Runge-Kutta methods and linear multistep methods
[TW-93-13] p 3847 N94-32206
Finite element solution to the Helmholtz equation with high wave number. Part 1: The h-version of the FEM
[AD-A277396] p 3848 N94-32341
Fourth-order 2N-storage Runge-Kutta schemes
[NASA-TM-109112] p 3573 N94-32950
Computational methods in continuum mechanics
[AD-A278144] p 3859 N94-33161
A study of weak solutions and their regularizations by numerical methods
[AD-A277453] p 3850 N94-33175
BOUSSINESQ APPROXIMATION
Renormalization group theory of Bolgiano scaling in Boussinesq turbulence
[NASA-TM-106602] p 3710 N94-33070
BOW WAVES
Analysis of data from the plasma composition experiment on the International Sun-Earth Explorer (ISEE 1)
[NASA-CR-195880] p 3893 N94-33074
BOX BEAMS
Structural testing of the technology integration box beam p 3628 N94-33125
Technology integration box beam failure study p 3628 N94-33126
BRAIDED COMPOSITES
Characterization and manufacture of braided composites for large commercial aircraft structures p 3630 N94-33137
BRAIN
Geometric structure of the adaptive controller of the human arm
[AD-A276797] p 3834 N94-32152
Sensory sensitivities and discriminations and their roles in aviation
[AD-A277312] p 3800 N94-32276
Neural network wavelet technology: A frontier of automation p 3839 N94-32425
The organization of the suprachiasmatic circadian pacemaker of the rat and its regulation by neurotransmitters and modulators
[AD-A277324] p 3793 N94-32622
Fast nonsupervised 3D registration of PET and MR images of the brain
[TELECOM-93-C-006] p 3798 N94-33069
BRANCHING (MATHEMATICS)
Bifurcation and deterministic chaos in dynamic systems
[REPT-93-047] p 3911 N94-31893
Structural stability and bifurcations p 3911 N94-31895
Numerical detection and continuation of codimension-two homoclinic bifurcations
[CWI-AM-R9308] p 3847 N94-32191
On the computation of simplical approximations of implicitly defined two-dimensional manifolds
[AD-A278132] p 3849 N94-33060
BRAYTON CYCLE
Development of lightweight radiators for lunar based power systems
[NASA-TM-106604] p 3726 N94-32272
BRAZING
Joining of alumina by vacuum brazing
[VTT-TIED-1495] p 3724 N94-31656
BRIGHTNESS
The stellar and gaseous content of massive low surface brightness disk galaxies p 3933 N94-31495
BRIGHTNESS TEMPERATURE
IRTM brightness temperature maps of the Martian south polar region during the polar night: The cold spots don't move p 3949 N94-33222
BRILLOUIN EFFECT
Methods for SBS threshold reduction
[AD-A276554] p 3717 N94-31936
BRILLOUIN ZONES
Strongly anisotropic s-wave versus d-wave gap in cuprate superconductors: Evidence and theory
[DE94-007579] p 3904 N94-32746
BRITTLE MATERIALS
Modeling of fracture and damage in quasibrittle materials p 3734 N94-31479
BRITTLENESS
Nonlocal theory for fracturing of quasibrittle materials
[AD-A278283] p 3740 N94-33143
BROADBAND
Waveform generation for ultra-wideband radar system
[AD-A276352] p 3673 N94-31401
Ultra wide band radar holographic imaging of subsurface targets
[DE94-004271] p 3713 N94-32681
Broadband, high-power, 2-30 MHz, twin-whip antenna. Computer and 1/10-scale model design study
[AD-A277619] p 3682 N94-32971
Generation of the ambiguity function for ultra wideband radar waveforms
[AD-A277913] p 3684 N94-33261
BROKEN SYMMETRY
Chiral symmetry and the threshold gamma(p) yields pi(sup 0)p reaction
[DE94-008117] p 3873 N94-32710
Quantum dynamics in dual spaces
[DE94-008303] p 3913 N94-32824
CP violation and the top quark
[DE94-008930] p 3874 N94-32841
Evidence for symmetry breaking local distortions in thallium barium copper oxide
[DE94-006149] p 3907 N94-32944
BROMIDES
Induced adsorption of chloride and bromide by submonolayer amounts of copper underpotentially deposited on Pt(111)
[AD-A278023] p 3648 N94-33182
BROWN DWARF STARS
Strongly coupled ionic mixtures and the H/He EOS
[DE94-006391] p 3934 N94-31782
BROWNIAN MOVEMENTS
The Laplace functional and Palm measure of a quasi-Cox process which is driven by a Markov chain
[REPT-93-82] p 3851 N94-31699
BSCCO SUPERCONDUCTORS
High T(sub c) superconductor tunnel junctions for photon detectors
[DE94-007686] p 3904 N94-32602
Microanalytical study of defect formation in thin bismuth strontium calcium copper oxide films
[DE94-008217] p 3661 N94-32751
BUCKLING
Ab initio study of the epitaxial growth of Ge on Si(100) surface
[DE94-007245] p 3904 N94-32724
BUDGETING
Budget allocation and monopolistic pricing in a multiproduct firm
[REPT-93-86] p 3924 N94-31617
BUFFETING
Active control for fin buffet alleviation
[AD-A276844] p 3586 N94-32224
Numerical analysis of transonic wing buffet p 3586 N94-32713
BUOYANCY
Effects of buoyancy on fluid flows and turbulence
[AD-A276586] p 3706 N94-32123
BUOYS
Profiling ALACE instruments
[AD-A277246] p 3789 N94-32321
BURNS (INJURIES)
Development of a video fluorescence system for assessing burn depth
[AD-A278127] p 3798 N94-33092
BURSTS
Development of high-pressure diaphragms for the AEDC impulse tunnel
[AD-A277053] p 3588 N94-32009

C

C-130 AIRCRAFT
Assessment of interior modifications in C-130 and C-141 aircraft for night vision goggle operations
[AD-A276843] p 3582 N94-32223
C-141 AIRCRAFT
Assessment of interior modifications in C-130 and C-141 aircraft for night vision goggle operations
[AD-A276843] p 3582 N94-32223
CADMIUM COMPOUNDS
Group 12 thiolates: Syntheses, characterization and decomposition pathways
[AD-A277055] p 3900 N94-32011
CADMIUM SELENIDES
The relationship of the electronic structures of semiconductor surfaces and heterostructures to crystal growth
[AD-A276465] p 3896 N94-31473
CADMIUM SULFIDES
Formation mechanism and yield of molecules ejected from ZnS, CdS, and FeS2 during ion bombardment
[DE94-008487] p 3871 N94-32515
CADMIUM TELLURIDES
Role of polycrystallinity in CdTe and CuInSe2 photovoltaic cells
[DE94-000293] p 3758 N94-31236
Development of a computer model for polycrystalline thin-film CuInSe2 and CdTe solar cells
[DE94-006853] p 3762 N94-32763
CAFFEINE
Review of pharmacological approach to improve cold tolerance p 3796 N94-31740
CALCITE
The pH of Mars p 3950 N94-33225
CALCIUM ISOTOPES
Influence of long-range correlations on the spectral functions and response of 48Ca and 90Zr
[ETN-94-96017] p 3865 N94-31537
CALCIUM OXIDES
The path for long range conduction in high J(sub c) TlBa2Ca2Cu3O(8+x) spray-pyrolyzed deposits
[DE94-007211] p 3909 N94-33271
CALCIUM SILICATES
Ion-beam-driven amorphization of Ca2La8(Si4)6O2 single crystals
[DE94-006219] p 3895 N94-31307
CALCULUS
Lambek calculus is L-complete
[LP-93-14] p 3841 N94-31388
Proving theorems of the Lambek calculus of order 2 in polynomial time
[CT-93-05] p 3842 N94-31393
Comparing models of the non-extensional typed lambda-calculus
[ML-93-19] p 3842 N94-31409
The decidability of dependency in intuitionistic propositional logic
[ML-93-20] p 3856 N94-31410
Completeness and decidability of the mixed style of inference with composition
[LP-93-09] p 3842 N94-31453
Lattice geometrodynamics p 3857 N94-31825
Combinatory reduction systems: Introduction and survey
[CWI-CS-R9362] p 3849 N94-32349
CALIBRATING
Viscoelastic fracture characterization of polymeric solids p 3652 N94-31745
Ground based radiometric and atmospheric measurements p 3744 N94-31855
Inflight calibration, preprocessing, and data evaluation of GER 2 imaging spectrometry data p 3744 N94-31858
OARE flight maneuvers and calibration measurements on STS-58
[NASA-TM-109093] p 3613 N94-32924
MODIS. Volume 2: MODIS level 1 geolocation, characterization and calibration algorithm theoretical basis document, version 1
[NASA-TM-104594-VOL-2] p 3613 N94-33289
CALIFORNIA
Differential interferometry study of an earthquake p 3756 N94-32570
Fluid mechanical measurements within the bottom boundary layer over the Northern California continental shelf during stress
[AD-A277916] p 3791 N94-33243
CALORIMETERS
Particle identification in a segmented calorimeter (NUMASS test data, September 1991)
[USIP-93-08] p 3711 N94-31085
The measurement of the hadronic energy flow and jet production with the ZEUS calorimeter in deep inelastic scattering events at HERA
[ETN-94-96021] p 3865 N94-31534
Gamma Large Area Silicon Telescope (GLAST)
[DE94-006439] p 3925 N94-31786
Ionization EM calorimetry with accordion electrodes and liquid krypton or argon
[DE94-009082] p 3713 N94-32821
CAMERAS
Hydrogenated amorphous silicon (a-Si:H) based gamma camera: Monte Carlo simulations
[DE94-007042] p 3795 N94-31323
CAD-based off-line planning for an active-vision system
[ISBN-0-315-86317-X] p 3813 N94-31713
Synchronized laser scanning three dimensional acquisition system
[ISBN-0-315-86848-1] p 3879 N94-31756
Gamma-ray optical counterpart search experiment (GROCSE)
[DE94-007124] p 3955 N94-32129
Fuzzy-neural control of an aircraft tracking camera platform p 3839 N94-32423
The trustworthy digital camera: Restoring credibility to the photographic image p 3714 N94-32470
CAMOUFLAGE
Atmospheric propagation effects through natural and man-made obscurants for visible to MM-wave radiation
[AD-A276919] p 3679 N94-32235
CANONICAL FORMS
Symplectic Runge-Kutta schemes 3: Canonical elementary differentials
[MATHS-REPT-A-204] p 3840 N94-31159
CANOPIES (VEGETATION)
The properties of sunflecks in a flexible plant canopy, and their relationship to turbulence p 3782 N94-31775
Research and applications of a canopy reflectance model p 3747 N94-32492
CANTILEVER BEAMS
A case study of analysis methods for large deflections of a cantilever beam
[NASA-TM-108454] p 3739 N94-32903
CAPACITANCE
Grounding ring for ground adapters
[AD-D016118] p 3697 N94-32962
CAPACITANCE SWITCHES
VLSI implementation of stray insensitive switched capacitor composite operational amplifiers
[AD-A276461] p 3687 N94-31240
CAPACITORS
VLSI implementation of stray insensitive switched capacitor composite operational amplifiers
[AD-A276461] p 3687 N94-31240
A series resonant converter in half bridge circuits with combined serial and parallel charge coupling and several output circuits
[ETN-94-95739] p 3687 N94-31373
Fractional-factorial process development techniques
[DE94-005580] p 3690 N94-31593
Evidence for a correct SiO2 voltage acceleration model
[DE94-006578] p 3690 N94-31594
Thin-film decoupling capacitors for multi-chip modules
[DE94-007743] p 3695 N94-32650
Temperature-humidity-bias aging technique to identify defective surface mount capacitors
[DE94-005354] p 3660 N94-32727
Overview of Sandia's electric vehicle battery program
[DE94-008944] p 3696 N94-32806
CAPE KENNEDY LAUNCH COMPLEX
Pen-based computers: Computers without keys p 3808 N94-32434
A systems approach to computer-based training p 3823 N94-32436
Chronology of KSC and KSC related events for 1993
[NASA-TM-109196] p 3966 N94-33072
CAPILLARY FLOW
Thermocapillary convection in evaporating sessile drops
[NASA-TM-109758] p 3705 N94-31886
CARBON
Theoretical studies of zirconium and carbon clusters with molecular dynamics simulations
[DE94-005276] p 3862 N94-31146
The effects of amorphous layer regrowth on carbon activation in GaAs and InP
[DE94-006290] p 3899 N94-31634
Deposition of DLC via intense ion beam ablation
[DE94-005583] p 3851 N94-31650
Structure-property relationships of carbon aerogels
[DE94-007120] p 3660 N94-32687
Compilation of diamond-like carbon properties for barriers and hard coatings
[DE94-008231] p 3661 N94-32803
Light utilization and photoinhibition of photosynthesis in marine phytoplankton
[DE94-005505] p 3794 N94-32896
Escape of Mars atmospheric carbon through time by photochemical means p 3948 N94-33214
CARBON CYCLE
Carbon cycle modeling calculations for the IPCC
[DE94-004332] p 3765 N94-32354
CARBON DIOXIDE
Application of natural refrigerants: A rational solution to a pressing problem
[PB94-138781] p 3668 N94-31073
Investigation of carbon dioxide in the central South Pacific Ocean (WOCE Sections P-16C and P-17C) during the TUNES/2 expedition of the R/V Thomas Washington, July-August, 1991
[DE94-006638] p 3763 N94-31347
Influence of carbon dioxide on electronic equipment: Fire extinguishing with low concentration
[PB94-148749] p 3691 N94-31848
Carbon cycle modeling calculations for the IPCC
[DE94-004332] p 3765 N94-32354
Carbon dioxide abatement as a differential game
[DE94-722023] p 3765 N94-32590
Removal of CO2 from flue gases by algae
[DE94-008039] p 3766 N94-32703
National US public policy on global warming derived from optimization of energy use and environmental impact studies
[DE94-004606] p 3768 N94-32790
A correlated k-distribution model of the heating rates for atmospheric mixtures of H2O, CO2, O3, CH4, and N2O in the 0-2500 cm(exp -1) wave number region at altitudes between 0 and 60 km
[DE94-005136] p 3775 N94-32895
A model for the evolution of CO2 on Mars p 3946 N94-33205
Mars atmospheric loss and isotopic fractionation by solar-wind-induced sputtering and photochemical escape p 3947 N94-33208
Escape of Mars atmospheric carbon through time by photochemical means p 3948 N94-33214
Controls on the CO2 seasonal cycle p 3950 N94-33227
Carbonate formation on Mars: Latest experiments p 3950 N94-33231
The influence of thermal inertia on Mars' seasonal pressure variation and the effect of the weather component p 3952 N94-33238
Simultaneous laboratory measurements of CO2 and H2O adsorption on palagonite: Implications for the Martian climate and volatile reservoir p 3952 N94-33240
Simulation of CO2 release at 800 km altitude
[AD-A276692] p 3776 N94-33272
CARBON DIOXIDE CONCENTRATION
Carbon balance in a forest ecosystem p 3770 N94-31007
Investigation of carbon dioxide in the central South Pacific Ocean (WOCE Sections P-16C and P-17C) during the TUNES/2 expedition of the R/V Thomas Washington, July-August, 1991
[DE94-006638] p 3763 N94-31347
Influence of carbon dioxide on electronic equipment: Fire extinguishing with low concentration
[PB94-148749] p 3691 N94-31848
Carbon cycle modeling calculations for the IPCC
[DE94-004332] p 3765 N94-32354
A correlated k-distribution model of the heating rates for atmospheric mixtures of H2O, CO2, O3, CH4, and N2O in the 0-2500 cm(exp -1) wave number region at altitudes between 0 and 60 km
[DE94-005136] p 3775 N94-32895
Effects of long-term elevated atmospheric CO2 concentrations on Pinus ponderosa
[DE94-008832] p 3769 N94-32966
Regional sedimentological variations among dark crater floor features: Toward a model for modern eolian sand distribution on Mars p 3946 N94-33203
Carbonate formation on Mars: Latest experiments p 3950 N94-33231
Obliquity variation in a Mars climate evolution model p 3951 N94-33236
Carbonates, surfates, phosphates, nitrates, and organic materials: Their association in a Martian meteorite p 3952 N94-33239
CARBON DIOXIDE LASERS
New material for high average power infrared generation: QPM-DB GaAs
[AD-A276389] p 3714 N94-31358
Automatic resonator alignment and power stabilization of high power C02 lasers
[ISBN-0-315-77217-4] p 3714 N94-31472
The development and testing of a backscatter absorption gas imaging (BAGI) system designed to image at a range of 300 m
[DE94-006192] p 3675 N94-31761

CARBON DIOXIDE REMOVAL
Removal of CO2 from flue gases by algae
[DE94-008039] p 3766 N94-32703
CARBON DISULFIDE
Methods for SBS threshold reduction
[AD-A276554] p 3717 N94-31936
Energy transfer properties and mechanisms
[DE94-007403] p 3636 N94-32594
CARBON FIBER REINFORCED PLASTICS
Unidirectional composites compressive behaviour: Test methods and micromechanical approach
[ONERA-NT-1993-10] p 3618 N94-31232
Evolution of the interface properties with temperature in the T800H/ bismaleimide composites
[ONERA-NT-1993-14] p 3619 N94-31478
Optimization of the forming parameters of PEEK/carbon fiber composite
[ISBN-0-315-86410-9] p 3620 N94-31716
Low velocity impact damage in carbon fiber/PEEK composite laminates
[ISBN-0-315-86546-6] p 3622 N94-31909
CARBON FIBERS
Optimization of the forming parameters of PEEK/carbon fiber composite
[ISBN-0-315-86410-9] p 3620 N94-31716
Surface conforming flexible eddy current probe for scanning varying surface contours
[AD-D016173] p 3627 N94-33018
Lightweight zinc electrode
[AD-D016181] p 3698 N94-33181
CARBON MONOXIDE
CO observations in external galaxies and gas mass determination p 3925 N94-31790
Vibrational energy transfer of diatomic gases in hypersonic expanding flows p 3570 N94-31958
A study of physical conditions, radiative transfer and shocks in the interstellar medium p 3937 N94-31963
Simulation of CO2 release at 800 km altitude
[AD-A276692] p 3776 N94-33272
CARBON 12
Mechanisms of formation and of de-excitation in the reaction Mg-24 + C-12 yields 9 alpha at 35MeV per nucleon
[ISBN-0-315-86746-9] p 3867 N94-31749
CARBON-CARBON COMPOSITES
Development of lightweight radiators for lunar based power systems
[NASA-TM-106604] p 3726 N94-32272
Improved oxidation resistance of 3-D carbon/carbon composites
[AD-A277349] p 3625 N94-32624
CARBONATES
Carbonate formation on Mars: Latest experiments p 3950 N94-33231
Carbonates, surfates, phosphates, nitrates, and organic materials: Their association in a Martian meteorite p 3952 N94-33239
CARBONYL COMPOUNDS
Novel approaches to the production of higher alcohols from synthesis gas
[DE94-006770] p 3666 N94-32132
Laser flash photolysis, EPR and Raman studies of liquids at elevated pressures
[DE94-008351] p 3718 N94-32413
Ligand intermediates in metal-catalyzed reactions
[DE94-008713] p 3638 N94-32887
CARBORANE
Processing boron and boron carbide thin films for protective coatings and device fabrication
[AD-A277266] p 3900 N94-32041
CARBOXYL GROUP
Reactions of electrophilic maleic anhydride and epoxy groups with nucleophilic functionalities such as carboxyl, hydroxyl, and amine groups. Polymer Technology Publication series no. 16
[PB94-135589] p 3648 N94-31069
CARBOXYLIC ACIDS
Recovery of carboxylic acids at pH greater than pKa
[DE94-007030] p 3636 N94-32376
Metal ion complexation by ionizable crown ethers
[DE94-008301] p 3661 N94-32847
CARGO AIRCRAFT
A comparison of military and commercial aircraft development
[AD-A276830] p 3575 N94-32168
CARRIER MOBILITY
Experimental and theoretical studies of hydrogenated amorphous semiconductor alloys and superlattices
[AD-A276159] p 3686 N94-31079
CASCADE FLOW
Computational study of simultaneous heat and mass transfer in turbulent separated flows p 3704 N94-31843
Design and initial testing of a facility to measure unsteady pressures on an oscillating cascade with supersonic leading edge locus p 3569 N94-31880
Development of a cascade simulation of fan-passage flow
[AD-A277234] p 3584 N94-32026
Hotwire measurements of the turbulent flow into a cascade of controlled-diffusion compressor blades
[AD-A277297] p 3706 N94-32042
Flutter analysis of a supersonic cascade in time domain using an ADI Euler solver
[NASA-TM-105625] p 3739 N94-32883
CASCADE RANGE (CA-OR-WA)
Analysis of deep seismic reflection and other data from the southern Washington Cascades
[DE94-005958] p 3771 N94-31525
CASCADE WIND TUNNELS
Hotwire measurements of the turbulent flow into a cascade of controlled-diffusion compressor blades
[AD-A277297] p 3706 N94-32042
CAST ALLOYS
Expandable pattern casting research
[DE94-004342] p 3668 N94-31604
CASTING
Expandable pattern casting research
[DE94-004342] p 3668 N94-31604
Processing and characterization of functionally gradient ceramic materials
[AD-A277154] p 3657 N94-32367
LLNL casting technology
[DE94-008282] p 3669 N94-32839
Leveraging metal matrix composites to reduce costs in space mechanisms p 3604 N94-33301
CASTINGS
Expandable pattern casting research
[DE94-004342] p 3668 N94-31604
CATACLYSMIC VARIABLES
Disk instability and the spectral evolution of the 1992 outburst of the intermediate polar GK Persei p 3928 N94-31123
A study of angular momentum loss in binaries using the free Lagrange method p 3931 N94-31134
Winds from disks in compact binaries
[DE94-007452] p 3938 N94-32137
CATALYSIS
Solidification structure synthesis in undercooled liquids
[AD-A276166] p 3910 N94-31054
Isomeric poly(benzophenone)s: Synthesis of highly crystalline poly (4, 4 foot-benzophenone) and amorphous poly (2, 5-benzophenone), a soluble poly (p-phenylene) derivative
[AD-A277261] p 3655 N94-32017
Heterogeneous catalytic process for alcohol fuels from syngas
[DE94-008729] p 3667 N94-32583
Catalytic methods using molecular oxygen for treatment of PMMS and ECLSS waste streams, volume 2
[NASA-CR-190299] p 3804 N94-32697
Methyl chloride by way of oxyhydrochlorination of methane
[DE94-009129] p 3637 N94-32767
The development of precipitated iron catalysts with improved stability
[DE94-008711] p 3638 N94-32886
Ligand intermediates in metal-catalyzed reactions
[DE94-008713] p 3638 N94-32887
The magnesium chelation step in chlorophyll biosynthesis
[DE94-008727] p 3794 N94-32890
CATALYSTS
Development of vanadium-phosphate catalysts for methanol production by selective oxidation of methane
[DE94-006759] p 3759 N94-31272
Development of a catalytic system for gasification of wet biomass
[DE94-006216] p 3759 N94-31762
Novel approaches to the production of higher alcohols from synthesis gas
[DE94-006770] p 3666 N94-32132
High octane ethers from synthesis gas-derived alcohols
[DE94-006774] p 3667 N94-32133
Heterogeneous catalytic process for alcohol fuels from syngas
[DE94-008729] p 3667 N94-32583
Methyl chloride by way of oxyhydrochlorination of methane
[DE94-009129] p 3637 N94-32767
Studies of the fundamental nature of catalytic acidity, sites and intermediates
[DE94-006999] p 3646 N94-32805
The development of precipitated iron catalysts with improved stability
[DE94-008711] p 3638 N94-32886
Technology development for iron Fischer-Tropsch catalysts
[DE94-008723] p 3638 N94-32889
Perfluoropolyalkylether decomposition on catalytic aluminas
[NASA-TM-106547] p 3617 N94-33021
CATALYTIC ACTIVITY
Development of vanadium-phosphate catalysts for methanol production by selective oxidation of methane
[DE94-006759] p 3759 N94-31272
Novel approaches to the production of higher alcohols from synthesis gas
[DE94-006770] p 3666 N94-32132
High octane ethers from synthesis gas-derived alcohols
[DE94-006774] p 3667 N94-32133
CATHODES
Emission from ferroelectric cathodes
[DE94-006732] p 3863 N94-31270
Hydrogen peroxide electrodes based on electrical connection of redox centers of various peroxidases to electrodes through a three-dimensional electron relaying polymer network
[AD-A276543] p 3691 N94-32056
CATHODIC COATINGS
Development of silver-zinc cells of improved cycle life and energy density
[AD-A277311] p 3693 N94-32329
CATIONS
Indium-vacancy complexes in mercury cadmium telluride
[AD-A276177] p 3894 N94-31055
Silicone grease as a precursor to a pseudo crown-ether ligand: Crystal structure of (K(+)K(Me2SiO)7(+))(HIn(CH2CMe3)3(-))4)
[AD-A276343] p 3895 N94-31327
A visible light initiating system for free radical promoted cationic polymerization
[AD-A277164] p 3655 N94-32069
High-energy chemical processes: Laser irradiation of aromatic hydrocarbons
[DE94-008107] p 3720 N94-32707
Method and apparatus for inhibiting the disbonding of a paint from metal surfaces
[AD-D016106] p 3663 N94-32960
CAUCHY PROBLEM
Viscous limiter functions for model convection-diffusion equations
[CRANFIELD-AERO-9103] p 3702 N94-31559
Elastic as limit of viscoelastic response, in a context of self-similar viscous limits
[AD-A277043] p 3738 N94-32273
CAVES
Proceedings of the 4th Tunnel Detection Symposium on Subsurface Exploration Technology
[AD-A276372] p 3771 N94-31369
CAVITATION FLOW
Fluid-structure interaction in case of water hammer with cavitation
[PB94-148277] p 3702 N94-31588
Simultaneous pressure measurement and high-speed photography study of cavitation in a dynamically loaded journal bearing
[NASA-TM-106456] p 3728 N94-32893
CAVITIES
Atomic oxygen interaction at defect sights in protective coatings on polymers flown on LDEF p 3593 N94-31024
Aperture excitation of electrically large, lossy cavities
[PB94-145711] p 3675 N94-31683
Gettering of metal impurities by cavities in silicon
[DE94-005248] p 3645 N94-32672
CAVITY FLOW
Steady thermal convection in multiple liquid layers p 3705 N94-31844
CCD STAR TRACKER
A low-cost, CCD solid state star tracker
[NASA-CR-192722] p 3882 N94-32417
CELESTIAL BODIES
Physical chemistry of molecules and grains in space
[AD-A276037] p 3932 N94-31280
CELESTIAL MECHANICS
General-relativistic celestial mechanics. 4: Theory of satellite motion
[PB94-147782] p 3601 N94-31769
CELL DIVISION
A cell-cycle model revisited
[CWI-AM-R9305] p 3851 N94-32229
CELL MEMBRANES (BIOLOGY)
Ninth International Workshop on Plant Membrane Biology
[DE94-005690] p 3794 N94-32769
CELLS (BIOLOGY)
Ninth International Workshop on Plant Membrane Biology
[DE94-005690] p 3794 N94-32769
CELLULOSE
Inorganic polymer engineering materials
[DE94-008519] p 3659 N94-32655

CENTER OF GRAVITY
General-relativistic celestial mechanics. 4: Theory of satellite motion
[PB94-147782] p 3601 N94-31769
CENTRAL NERVOUS SYSTEM
Neostriatal neuronal activity and behavior
[AD-A276429] p 3802 N94-33333
CENTRAL PROCESSING UNITS
Study of structures of different complexity for the communication between two processors
[ETN-94-95750] p 3674 N94-31615
Multiple-valued programmable logic array minimization by solution space search
[AD-A278033] p 3821 N94-33090
CENTRIFUGAL CASTING
Effect of surface forces on the rheology of particle-liquid systems and the consolidation of ceramic powders
[AD-A277092] p 3657 N94-32391
CENTRIFUGES
An investigation of acoustic noise requirements for the Space Station centrifuge facility
[NASA-TM-108811] p 3805 N94-32936
CERAMIC COATINGS
The development of CVR coatings for PBR fuels
[DE94-004233] p 3875 N94-31480
Mass-loaded coating for reducing the resonant frequency of a ceramic disc
[AD-D016095] p 3660 N94-32739
CERAMIC FIBERS
Passive vibration damping materials: Piezoelectric ceramic composites for vibration damping applications
[AD-A276550] p 3653 N94-31935
Pressureless sintering of ceramic composites
[AD-A277274] p 3657 N94-32404
CERAMIC MATRIX COMPOSITES
Processing of novel nanoparticle dispersion strengthened ceramics for improved mechanical performance
[AD-A275965] p 3649 N94-31276
Passive vibration damping materials: Piezoelectric ceramic composites for vibration damping applications
[AD-A276550] p 3653 N94-31935
Toughening mechanisms in fiber-reinforced ceramic-matrix composites p 3622 N94-31943
Finite element analysis of damage in fibrous composites using a micromechanical model
[AD-A277226] p 3623 N94-32024
Mechanics of the single fiber pullout problem with several interface conditions p 3623 N94-32078
Processing and characterization of functionally gradient ceramic materials
[AD-A277154] p 3657 N94-32367
Pressureless sintering of ceramic composites
[AD-A277274] p 3657 N94-32404
Mechanics of cracking for composite material p 3624 N94-32501
Ceramic Technology Project database
[DE94-008494] p 3659 N94-32632
Effect of elevated temperature and cyclic loading on properties and damage modes in ceramic composites
[DE94-008736] p 3662 N94-32891
Conversion of polymers of methyl- and vinylsilane to Si-C ceramics
[NASA-TM-106554] p 3662 N94-32945
Fracture micromechanics of continuous fiber and textile reinforced metal and ceramic matrix composites
[AD-A277434] p 3627 N94-33008
On the mechanics of microballoon-reinforced metal matrix composites
[AD-A277928] p 3630 N94-33178
Novel precursor approached for CMC derived by polymer pyrolysis
[AD-A278383] p 3665 N94-33352
CERAMICS
Physical properties of glasses exposed to Earth-facing and trailing-side environments on LDEF p 3594 N94-31030
Piezoelectric materials research in Europe
[AD-A276207] p 3648 N94-31059
Evaluation of nondestructive inspection techniques for quality control of alumina-ceramic housing components
[AD-A276220] p 3730 N94-31065
Processing of novel nanoparticle dispersion strengthened ceramics for improved mechanical performance
[AD-A275965] p 3649 N94-31276
Cost-effective ceramic machining: Summary of three-body wear experiments
[DE94-007757] p 3650 N94-31354
Naval Surface Warfare Center Dahlgren Division Technical Digest: Advanced materials technology
[AD-A276448] p 3668 N94-31364
Development and characterization of intermediary layers allowing the bond between a metal alloy and a plasma sprayed ceramic
[ECL-91-39] p 3619 N94-31377
Reliability analysis of structural ceramics subjected to biaxial flexure p 3650 N94-31454
Joining of alumina by vacuum brazing
[VTT-TIED-1495] p 3724 N94-31656
Characterization and growth mechanisms of the MgAl2O4 phase in Al2O3-reinforced Al-Mg composites
[ISBN-0-315-86531-8] p 3620 N94-31706
High temperature NASP engine seal development
[NASA-TM-109750] p 3725 N94-31804
Elastic modulus measurements of LDEF glasses and glass-ceramics using a speckle technique
[NASA-CR-195911] p 3653 N94-31851
High-temperature deformation and fracture toughness of duplex ceramic microstructures p 3653 N94-31945
Processing and characterization of functionally gradient ceramic materials
[AD-A277154] p 3657 N94-32367
Effect of surface forces on the rheology of particle-liquid systems and the consolidation of ceramic powders
[AD-A277092] p 3657 N94-32391
Proceedings of the Ad Hoc Workshop on Ceramics for Li/FeS2 batteries
[DE94-007460] p 3694 N94-32607
Mechanical properties of vacuum-sintered yttria ceramics
[DE94-008138] p 3659 N94-32617
Ceramic Technology Project database
[DE94-008494] p 3659 N94-32632
Compositions and chemical bonding in ceramics by quantitative electron energy-loss spectrometry
[DE94-007208] p 3659 N94-32640
Thin-film decoupling capacitors for multi-chip modules
[DE94-007743] p 3695 N94-32650
Energetics, bonding mechanism, and electronic structure of ceramic/ceramic and metal/ceramic interfaces
[DE94-008551] p 3659 N94-32656
Fabrication, phase transformation studies and characterization of SiC-AlN-Al2OC ceramics
[DE94-008587] p 3659 N94-32657
Temperature-humidity-bias aging technique to identify defective surface mount capacitors
[DE94-005354] p 3660 N94-32727
Effect of elevated temperature and cyclic loading on properties and damage modes in ceramic composites
[DE94-008736] p 3662 N94-32891
Materials development program: Ceramic technology project bibliography, 1984-1992
[DE94-009297] p 3662 N94-32935
Characterization of nanoparticles and nanophase materials
[DE94-008348] p 3907 N94-32990
Development of lightweight ceramic ablators and arc-jet test results
[NASA-TM-108798] p 3617 N94-33117
Nonlocal theory for fracturing of quasibrittle materials
[AD-A278283] p 3740 N94-33143
On the mechanics of microballoon-reinforced metal matrix composites
[AD-A277928] p 3630 N94-33178
Ceramic and metal composite circuit-board-level technology for application specific electronic modules (ASEM)
[AD-A277961] p 3630 N94-33180
Novel sol-gel deposition for repair of conducting paths in polyceramic systems
[AD-A278381] p 3664 N94-33350
Novel precursor approached for CMC derived by polymer pyrolysis
[AD-A278383] p 3665 N94-33352
CERENKOV RADIATION
Second-order nonlinear optical polymers: From fundamentals to applications
[AD-A277514] p 3664 N94-33348
CERIUM OXIDES
Conductivity measurements of ceria-based solid electrolytes using AC impedance
[DE94-007380] p 3694 N94-32593
CESIUM
An investigation of the radiolytic stability of a resorcinol-formaldehyde ion exchange resin
[DE94-007971] p 3660 N94-32698
CESIUM IODIDES
Mechanisms of formation and of de-excitation in the reaction Mg-24 + C-12 yields 9 alpha at 35MeV per nucleon
[ISBN-0-315-86746-9] p 3867 N94-31749
CHANGE DETECTION
SPOT imagery for updating land cover information of 1:50,000 numerical topographic maps p 3749 N94-32532
Land cover change detection with ERS-1 data and data from other remote sensing satellites. Example: The delta of the River Ebro (Spain) p 3755 N94-32564
Evaluation of surface phase change on large zones p 3755 N94-32567
CHANNELS (DATA TRANSMISSION)
Channel equalization for block transmission systems
[TELECOM-93-D-002] p 3670 N94-31093
Covert channel analysis of trusted systems. A guide to understanding
[AD-A276418] p 3916 N94-31331
CHAOS
Taming chaotic circuits p 3910 N94-31289
Chaotic attitude motion of satellites in the central gravitational field
[ISBN-0-315-78768-6] p 3610 N94-31723
Bifurcation and deterministic chaos in dynamic systems
[REPT-93-047] p 3911 N94-31893
Deterministic chaos p 3912 N94-31896
Seasons and chaos in population dynamics p 3912 N94-31897
CHARACTER RECOGNITION
Real time character recognition for F-111C video tape records
[AD-A277061] p 3580 N94-32263
CHARACTERIZATION
Synthesis, characterization, phase diagrams and superconducting, and normal state magnetic properties of La(2-x)Sr(x)CuO4 (0 is less than or equal to x which is less than or equal to 0.08) and electrochemically oxidized La(2-x)Sr(x)CuO(4 + delta) (0 is less than or equal to x which is less than or equal to 0.33, 0 is less than or equal to delta which is less than or equal to 0.12)
[DE94-005260] p 3895 N94-31067
Employment of a porous gold actuator in ISFET-based coulometric sensor-actuator systems with application to protein characterization
[ISBN-9-09-005887-7] p 3689 N94-31536
Stellar x ray polarimeter polarizer development and calibration at LEA/LLNL
[DE94-006400] p 3712 N94-31783
MODIS. Volume 2: MODIS level 1 geolocation, characterization and calibration algorithm theoretical basis document, version 1
[NASA-TM-104594-VOL-2] p 3613 N94-33289
CHARGE COUPLED DEVICES
Degradation of optical components in space p 3594 N94-31029
Development and application of photosensitive device systems to studies of biological and organic materials
[DE94-008503] p 3793 N94-32516
A 10 GHz bandwidth, single transient, digitized oscilloscope with 20 GHz capability
[DE94-005400] p 3713 N94-32728
High frequency active auroral research program (HAARP) imager
[AD-A277469] p 3775 N94-32999
CHARGE EXCHANGE
Influence of long-range correlations on the spectral functions and response of 48Ca and 90Zr
[ETN-94-96017] p 3865 N94-31537
CHARGE TRANSFER
Recent developments in polymeric charge transfer complexes
[AD-A277108] p 3654 N94-31979
The charging effect in high-Tc superconducting thin films
[AD-A277265] p 3900 N94-32040
Electronic and nuclear factors in intramolecular charge and excitation transfer processes
[DE94-006598] p 3870 N94-32178
Intramolecular charge transfer complexes as fluorescence probes for UV and visible light induced acrylate polymerization
[AD-A277129] p 3657 N94-32381
Compositions and chemical bonding in ceramics by quantitative electron energy-loss spectrometry
[DE94-007208] p 3659 N94-32640
CHARGE TRANSFER DEVICES
Deep water studies of CTD data
[AD-A277741] p 3791 N94-33176
CHARGED PARTICLES
Molecular dynamics computer simulations of charged metal electrode-aqueous electrolyte interfaces
[AD-A276401] p 3863 N94-31237
The Kaluza-Klein approach and gauge supersymmetry
[ISBN-0-315-86553-9] p 3912 N94-31911
Hydrodynamics of neutron star interiors and laboratory superfluids p 3936 N94-31949
Characterization of atomic and molecular impurity sources and transport at the tokamak edge
[DE94-007212] p 3891 N94-32619
CHARPY IMPACT TEST
Reactor pressure vessel structural integrity research in the US Nuclear Regulatory Commission HSST and HSSI Programs
[DE94-006550] p 3739 N94-32771
CHASSIGNITES
SNC meteorites and their implications for reservoirs of Martian volatiles p 3947 N94-33209

The Martian sources of the SNC meteorites (two, not one), and what can and can't be learned from the SNC meteorites p 3951 N94-33234

CHELATION

The magnesium chelation step in chlorophyll biosynthesis
[DE94-008727] p 3794 N94-32890

CHEMICAL ANALYSIS

Fiber optic chemical sensors on Mars
[DE94-005251] p 3941 N94-31145

An axial approach to detection in capillary electrophoresis
[DE94-005556] p 3631 N94-31154

Double rotation NMR studies of zeolites and aluminophosphate molecular sieves
[DE94-007032] p 3866 N94-31637

Composition and properties of dust from Comet Halley p 3936 N94-31947

A chemical analysis of solar neighborhood dwarfs p 3926 N94-31951

New zinc-bis(dialkylamides) potentially usable as site-selective dopants for p-type ZnSe
[AD-A276947] p 3902 N94-32218

Molecular Science Research Center
[DE94-007464] p 3871 N94-32605

Multiple size scale structures in silica/siloxane composites studied by small-angle scattering
[DE94-007300] p 3625 N94-32642

Molten metal analysis by laser produced plasmas
[DE94-007014] p 3646 N94-32782

Characterization of nanoparticles and nanophase materials
[DE94-008348] p 3907 N94-32990

CHEMICAL ATTACK

Characterization of the corrosion resistance of duplex stainless steels using local current density mapping techniques
[DE94-007980] p 3646 N94-32699

Compilation of diamond-like carbon properties for barriers and hard coatings
[DE94-008231] p 3661 N94-32803

CHEMICAL BONDS

Modification of semiconductor surface properties with chemically bound molecular films
[AD-A276162] p 3895 N94-31081

Design of new polymers to improve radiation stability of plastic scintillators
[DE94-008220] p 3652 N94-31764

A genetic algorithm based method for docking flexible molecules
[DE94-007525] p 3793 N94-32269

Compositions and chemical bonding in ceramics by quantitative electron energy-loss spectrometry
[DE94-007208] p 3659 N94-32640

Ab initio study of the epitaxial growth of Ge on Si(100) surface
[DE94-007245] p 3904 N94-32724

Metal ion complexation by ionizable crown ethers
[DE94-008301] p 3661 N94-32847

X ray absorption study of pulsed laser deposited boron nitride films
[DE94-008295] p 3662 N94-32855

CHEMICAL CLOUDS

Theory, Image Simulation, and Data Analysis of Chemical Release Experiments
[NASA-CR-194865] p 3954 N94-31101

CHEMICAL COMPOSITION

Cloud studies seen from a physical chemist's perspective
[DE94-006059] p 3771 N94-31527

Composition and properties of dust from Comet Halley p 3936 N94-31947

The chemical and dynamical evolution of the galaxy p 3936 N94-31950

A chemical analysis of solar neighborhood dwarfs p 3926 N94-31951

Group 12 thiolates: Syntheses, characterization and decomposition pathways
[AD-A277055] p 3900 N94-32011

Sodium sulfate corrosion of silicon carbide fiber-reinforced lithium aluminosilicate glass-ceramic matrix composites
[AD-A277224] p 3623 N94-32023

Organic analyses of the Murchison meteorite p 3938 N94-32489

Molecular Science Research Center
[DE94-007464] p 3871 N94-32605

On the formation of muon- and zeta-phases in Ag-Al system by mechanical alloying
[DE94-007125] p 3645 N94-32636

Ionization probes of molecular structure and chemistry
[DE94-007605] p 3872 N94-32643

SOLGAS refined: A computerized thermodynamic equilibrium calculation tool
[DE94-009021] p 3913 N94-32846

Evidence for ultramafic lavas on Syrtis Major p 3950 N94-33229

CHEMICAL DEFENSE

Aircrew Eye/Respiratory Protection (AERP): 16-hour extended wear evaluation of chemical protective equipment
[AD-A277288] p 3804 N94-32609

CHEMICAL EFFECTS

A model of the ion chemistry of electrified convection p 3868 N94-31993

CHEMICAL ELEMENTS

New zinc-bis(dialkylamides) potentially usable as site-selective dopants for p-type ZnSe
[AD-A276947] p 3902 N94-32218

CHEMICAL ENGINEERING

Performance of selected polymeric materials on LDEF p 3593 N94-31023

CHEMICAL EQUILIBRIUM

CET93 and CETPC: An interim updated version of the NASA Lewis computer program for calculating complex chemical equilibria with applications
[NASA-TM-4557] p 3638 N94-32948

CHEMICAL EXPLOSIONS

A compatibility study of FEFO with various containment materials
[DE94-005753] p 3649 N94-31198

CHEMICAL REACTIONS

Reactions of electrophilic maleic anhydride and epoxy groups with nucleophilic functionalities such as carboxyl, hydroxyl, and amine groups. Polymer Technology Publication series no. 16
[PB94-135589] p 3648 N94-31069

High-temperature study of O+H2CO yields OH+HCO
[DE94-006837] p 3864 N94-31321

Cloud studies seen from a physical chemist's perspective
[DE94-006059] p 3771 N94-31527

Modern integral equation techniques for quantum reactive scattering theory
[DE94-007039] p 3857 N94-31639

A numerical method for mixing/chemically reacting compressible flow with finite rate chemistry p 3634 N94-31824

A comparison between two Monte Carlo codes on determination of transient chemical yields
[DE94-007224] p 3636 N94-32251

Ionization probes of molecular structure and chemistry
[DE94-007605] p 3872 N94-32643

Time-resolved analytical methods for liquid/solid interfaces
[DE94-008352] p 3637 N94-32826

Computed potential energy surfaces for chemical reactions
[NASA-CR-195835] p 3639 N94-33036

The mineralogic evolution of the Martian surface through time: Implications from chemical reaction path modeling studies p 3950 N94-33226

CHEMICAL REACTORS

Direct aromatization of methane
[DE94-008719] p 3638 N94-32888

CHEMISORPTION

Chemisorbed-molecule potential-energy surfaces and electronically-stimulated processes
[DE94-007932] p 3719 N94-32603

CHINA

Solar energy in China
[PB94-137502] p 3758 N94-31071

Station climatic summaries: China, the former USSR, and Mongolia
[AD-A276548] p 3784 N94-32057

CHIPS (ELECTRONICS)

Universal signal conditioning amplifier p 3699 N94-32460

Thin-film decoupling capacitors for multi-chip modules
[DE94-007743] p 3695 N94-32650

VLSI for high-speed digital signal processing
[AD-A277617] p 3697 N94-32957

Buffered feedthrough crossbar switch
[AD-D016145] p 3697 N94-32967

CHIRAL DYNAMICS

Chiral symmetry and the threshold gamma(p) yields pi(sup 0)p reaction
[DE94-008117] p 3873 N94-32710

CHIRP

Advanced satellite communication system
[NASA-CR-194211] p 3681 N94-32477

CHIRP SIGNALS

System analysis of ultra-wideband instrumentation radars: Impulse versus stepped-chirp approaches
[AD-A276624] p 3677 N94-32087

CHLORIDES

Induced adsorption of chloride and bromide by submonolayer amounts of copper underpotentially deposited on Pt(111)
[AD-A278023] p 3648 N94-33182

CHLORINATION

Methyl chloride by way of oxyhydrochlorination of methane
[DE94-009129] p 3637 N94-32767

CHLORINE OXIDES

Possible effect of the chlorine oxide dimer on transient ozone loss in rocket plumes
[AD-A278135] p 3616 N94-33094

CHLOROPHYLLS

The magnesium chelation step in chlorophyll biosynthesis
[DE94-008727] p 3794 N94-32890

Evolution of upwelling fronts off the coast of Portugal
[NASA-CR-195692] p 3790 N94-33045

CHLOROPLASTS

The magnesium chelation step in chlorophyll biosynthesis
[DE94-008727] p 3794 N94-32890

CHOLESKY FACTORIZATION

Channel equalization for block transmission systems
[TELECOM-93-D-002] p 3670 N94-31093

CHROMATOGRAPHY

Organic analyses of the Murchison meteorite p 3938 N94-32489

Time-resolved analytical methods for liquid/solid interfaces
[DE94-008352] p 3637 N94-32826

CHROMIC ACID

Anodized aluminum on LDEF p 3592 N94-31017

CHROMIUM

Soft x ray photoelectron spectroscopy study of the interaction of Cr with MoS2(0001)
[AD-A276916] p 3635 N94-32233

CHROMIUM ALLOYS

Creep properties of vanadium-base alloys
[DE94-008541] p 3641 N94-31486

CHROMIUM STEELS

Creep-fatigue criteria and inelastic behavior of modified 9Cr-1Mo steel at elevated temperatures
[DE94-007915] p 3642 N94-31918

CHRONOLOGY

Extraction of forests stand age parameters from airborne imaging spectroscopy data p 3745 N94-31867

Chronology of KSC and KSC related events for 1993
[NASA-TM-109196] p 3966 N94-33072

CIRCADIAN RHYTHMS

Unit specific crew rest strategies: Phase 1 evaluation of the 1/212th Aviation Battalion during shiftwork transitions
[AD-A277122] p 3804 N94-32379

The organization of the suprachiasmatic circadian pacemaker of the rat and its regulation by neurotransmitters and modulators
[AD-A277324] p 3793 N94-32622

CIRCUIT BOARDS

From display and PWB to MCMs: Large panel manufacturing
[DE94-007855] p 3693 N94-32386

VLSI for high-speed digital signal processing
[AD-A277617] p 3697 N94-32957

Space flight printed wiring board measling investigation
[NASA-TM-104602] p 3732 N94-33101

Ceramic and metal composite circuit-board-level technology for application specific electronic modules (ASEM)
[AD-A277961] p 3630 N94-33180

CIRCUIT DIAGRAMS

Some problems of applied algebra
[CWI-AM-R9306] p 3647 N94-32204

CIRCUIT RELIABILITY

Interpreter composition issues in the formal verification of a processor-memory module
[NASA-CR-4594] p 3820 N94-32775

CIRCUITS

Taming chaotic circuits p 3910 N94-31289

Extension of the LUSTRE language and application to circuit design: The LUSTRE V4 language and the POLLUX system
[ETN-94-95918] p 3812 N94-31543

Validation of the Environmentally Conscious Manufacturing Integrated Demonstration hardware
[DE94-003824] p 3765 N94-32144

Digital beamforming and filtering circuit
[AD-D016142] p 3697 N94-32976

CIRCULAR CYLINDERS

The effect of an axial flow component on a circular cylinder wake p 3699 N94-31209

Single scattering of light by ensembles of particles with various shapes
[ETN-94-96016] p 3878 N94-31550

CIRCULAR POLARIZATION

Element-specific magnetic hysteresis measurements, a new application of circularly polarized soft x-rays
[DE94-007122] p 3858 N94-31397

High-resolution synthetic aperture radar observations of the Moon p 3676 N94-31952
The 20 GHz circularly polarized, high temperature superconducting microstrip antenna array [NASA-CR-195097] p 3683 N94-33083
Coherent processes in atom in strong radiation fields [AD-A276388] p 3874 N94-33144

CIRCULATORY SYSTEM
Incompressible viscous flow in tubes with occlusions [ISBN-0-315-75467-2] p 3704 N94-31778

CIRRUS CLOUDS
Sensitivity analysis of the AVHRR infrared cirrus model [AD-A276690] p 3784 N94-32117

CIVIL AVIATION
A comparison of military and commercial aircraft development [AD-A276830] p 3575 N94-32168
The 1993 aviation system capacity plan [AD-A276958] p 3575 N94-32620

CLASSIFICATIONS
Neural network definitions of highly predictable protein secondary structure classes [DE94-006234] p 3834 N94-32175

CLASSIFIERS
A fuzzy classifier system for process control p 3839 N94-32422

CLEANING
Fatigue testing of 2024-T3 material after four cycles of PMB stripping [AD-A276926] p 3644 N94-32237

CLEANLINESS
Design, development, and testing of a lightweight optical sensor cover system p 3604 N94-33302

CLIMATE
The Earth's climate: Past, present, and future p 3777 N94-30982
Energetic and general circulation p 3777 N94-30983
The Global Climatology Network precipitation data [DE93-019199] p 3764 N94-31596
Selection of climate station data using clustering and triangulated irregular network techniques [AD-A276658] p 3784 N94-32046
Station climatic summaries: China, the former USSR, and Mongolia [AD-A276548] p 3784 N94-32057
Homogeneous global mean temperature time series [DE94-002194] p 3766 N94-32690
Fine resolution atmospheric sulfate model driven by operational meteorological data: Comparison with observations [DE94-002994] p 3766 N94-32691
Proceedings of the Ninth Annual Pacific Climate (PACLIM) Workshop [DE94-003024] p 3766 N94-32693
Diagnostic studies of climate variability [DE94-003629] p 3767 N94-32711
Physical basis for climate change models [DE94-003827] p 3767 N94-32712
Climate effects of anthropogenic sulfate: Simulations from a coupled chemistry/climate model [DE94-004352] p 3767 N94-32789
Parameterizing atmosphere-land surface exchange for climate models with satellite data: A case study for the Southern Great Plains CART site [DE94-005109] p 3775 N94-32874
The effect of polar caps on obliquity p 3948 N94-33213
Obliquity variation in a Mars climate evolution model p 3951 N94-33236

CLIMATE CHANGE
The Earth's climate: Past, present, and future p 3777 N94-30982
Interaction processes between the ocean and the atmosphere p 3777 N94-30987
The climate of the Mediterranean basin: Its sensitivity to global change p 3778 N94-30993
Sources and wells of minor atmospheric constituents of climatic importance p 3770 N94-31008
Climatic evolution and desertization p 3780 N94-31009
Global change research and NASA's Earth Observing System [PB94-126992] p 3741 N94-31068
The complementary nature of the SPOT and ERS-1 systems and their place in major international programmes p 3748 N94-32524
Homogeneous global mean temperature time series [DE94-002194] p 3766 N94-32690
Proceedings of the Ninth Annual Pacific Climate (PACLIM) Workshop [DE94-003024] p 3766 N94-32693
Diagnostic studies of climate variability [DE94-003629] p 3767 N94-32711
Physical basis for climate change models [DE94-003827] p 3767 N94-32712
Biospheric effects of a large extraterrestrial impact: Case study of the Cretaceous/Tertiary boundary crater [NASA-CR-195827] p 3942 N94-32740
Environmental issues related to biomass: An overview [DE94-007226] p 3767 N94-32784
National US public policy on global warming derived from optimization of energy use and environmental impact studies [DE94-004606] p 3768 N94-32790
Quantified estimates of total GWPs for greenhouse gases taking into account tropospheric chemistry [DE94-007846] p 3768 N94-32817
Ocean variability and its influence on the detectability of greenhouse warming signals [DE94-008670] p 3790 N94-32881
Current policies of the major countries coping with the global warming problem and-the energy demand and supply [DE94-757291] p 3769 N94-32920
Polar sediment accumulation: Role of surface winds at the two poles p 3951 N94-33233

CLIMATOLOGY
Subtropical Climates and Their Evolution: From Space-Based Observation to Modelling [ISBN-2-85-428333-3] p 3776 N94-30981
Climatologic flux in tropical ocean p 3777 N94-30985
Dynamic climatology of West Africa p 3778 N94-30988
Dynamics in the tropics and synoptic disturbances p 3778 N94-30990
Effects of the deep tropical convection in the large scale atmospheric flow p 3778 N94-30994
The surface parameters: Remote sensing observations and climatology applications p 3779 N94-31001
Sources and wells of minor atmospheric constituents of climatic importance p 3770 N94-31008
Climatic evolution and desertization p 3780 N94-31009
Modeling of the continental biosphere p 3770 N94-31011
Cumulus convection parameterization and numerical modelling of moist atmospheres p 3783 N94-31989
Selection of climate station data using clustering and triangulated irregular network techniques [AD-A276658] p 3784 N94-32046
Station climatic summaries: China, the former USSR, and Mongolia [AD-A276548] p 3784 N94-32057
Sensitivity analysis of the AVHRR infrared cirrus model [AD-A276690] p 3784 N94-32117
Use of SPOT and ERS-1 SAR data to study the tectonic and climatic history of arid regions p 3752 N94-32550
Homogeneous global mean temperature time series [DE94-002194] p 3766 N94-32690
Proceedings of the Ninth Annual Pacific Climate (PACLIM) Workshop [DE94-003024] p 3766 N94-32693
Diagnostic studies of climate variability [DE94-003629] p 3767 N94-32711
Statistical intercomparison of global climate models: A common principal component approach [DE94-008671] p 3768 N94-32882
Forecasters handbook for the Philippine Islands and surrounding waters [AD-A277993] p 3787 N94-33089
The Northern Plains MSATT Meeting, and a call for a field-oriented successor to MSATT p 3947 N94-33210
The effect of polar caps on obliquity p 3948 N94-33213
Obliquity variation in a Mars climate evolution model p 3951 N94-33236
Simultaneous laboratory measurements of CO2 and H2O adsorption on palagonite: Implications for the Martian climate and volatile reservoir p 3952 N94-33240

CLINICAL MEDICINE
Development of a video fluorescence system for assessing burn depth [AD-A278127] p 3798 N94-33092
Characterization and utilization of opiate-like hibernation factors [AD-A278136] p 3794 N94-33098

CLOSED CYCLES
Control experiments in liquid metal combustion [AD-A276918] p 3635 N94-32234

CLOUD COVER
Use of Air Force cloud cover data to evaluate and improve cloud forecasts and parameterizations in mesocale meteorological models [AD-A277384] p 3784 N94-32054

CLOUD HEIGHT INDICATORS
Development of a statistical method for estimating the downward longwave radiation at the surface from satellite observations p 3742 N94-31553

CLOUD PHYSICS
Cloud studies seen from a physical chemist's perspective [DE94-006059] p 3771 N94-31527
Development of a statistical method for estimating the downward longwave radiation at the surface from satellite observations p 3742 N94-31553
Boundary-layer cumulus over land: Some observations and conceptual models [DE93-040820] p 3781 N94-31597
Radar scattering from the summer polar mesosphere: Theory and observations p 3772 N94-32077
A parameterization of cloud droplet nucleation [DE94-007469] p 3785 N94-32268

CLOUDS (METEOROLOGY)
Interaction processes between the ocean and the atmosphere p 3777 N94-30987
Effects of the deep tropical convection in the large scale atmospheric flow p 3778 N94-30994
Treatment of cloud radiative effects in general circulation models [DE94-001864] p 3764 N94-31600
Use of Air Force cloud cover data to evaluate and improve cloud forecasts and parameterizations in mesocale meteorological models [AD-A277384] p 3784 N94-32054
A parameterization of cloud droplet nucleation [DE94-007469] p 3785 N94-32268
An integrated cloud observation and modeling investigation in support of the ARM program [DE94-003160] p 3785 N94-32716
Use of cloud observations and mesoscale meteorology models to evaluate and improve cloud parameterizations [DE94-003610] p 3785 N94-32717
TRMM-related research: Tropical rainfall and energy analysis experiment [NASA-CR-195834] p 3787 N94-33288

CLUSTER ANALYSIS
Automated detection of ship tracks in multispectral satellite data [AD-A276697] p 3746 N94-32119
Database tomography for commercial application p 3923 N94-32442

CLUTTER
System analysis of ultra-wideband instrumentation radars: Impulse versus stepped-chirp approaches [AD-A276624] p 3677 N94-32087
Validation support of the ERIM ocean model [AD-A277364] p 3788 N94-32284

CMOS
A silicon condenser microphone: Modelling and electronic circuitry [ISBN-9-09-005279-8] p 3688 N94-31517
Chemical vapour deposition of tungsten for the application in integrated circuits [ISBN-9-09-005151-1] p 3641 N94-31519
A hierarchical approach to test generation for CMOS VLSI circuits [ISBN-9-09-005449-9] p 3689 N94-31535

COAL DERIVED GASES
High octane ethers from synthesis gas-derived alcohols [DE94-006774] p 3667 N94-32133

COASTAL CURRENTS
ADCIRC: An advanced three-dimensional circulation model for shelves, coasts, and estuaries. User's manual for ADCIRC-2DDI [AD-A276150] p 3787 N94-31250

COASTAL WATER
Surface forward-scattered acoustic measurements and analysis [AD-A276998] p 3788 N94-32000
Three dimensional vorticity field in the California current system [AD-A276951] p 3788 N94-32220
Evolution of upwelling fronts off the coast of Portugal [NASA-CR-195692] p 3790 N94-33045
Index and bulk parameters for frequency-direction spectra measured at CERC Field Research Facility [AD-A277759] p 3791 N94-33085

COASTS
The evolution of jet features during the 1993 east coast white hurricane: A case study using the global spectral model [AD-A277217] p 3783 N94-32021
ENSO forced variations of the sea surface temperature and adjusted sea level along the west coast of the United States [AD-A277306] p 3789 N94-32327
Contribution of SAR ERS1 data to study the French Guiana tropical coast environment [BRGM-93034] p 3748 N94-32527

Evolution of diurnal surface winds and surface currents for Monterey Bay
[AD-A277649] p 3790 N94-33057
Coastal boundary layer and refractivity measurements using the ground-based high resolution interferometer sounder (GB-HIS)
[AD-A277980] p 3683 N94-33159

COATING
Sol-gel metal oxide and metal oxide/polymer multilayers applied by meniscus coating
[DE94-005813] p 3649 N94-31199
An investigation of the spin-coating process and a model for three-dimensional regular foams
p 3649 N94-31206
Evaluation of the Hughes conversion coating touch-up pen
[AD-A278398] p 3664 N94-33166

COATINGS
Anodized aluminum on LDEF p 3592 N94-31017
Large-area conditioning of optics for high-power laser systems
[DE94-007028] p 3716 N94-31636
Sol-gel coatings for high power laser optics: Past, present, and future
[DE94-007240] p 3718 N94-32252

COBALT ALLOYS
Development of nickel and metal hydride secondary battery
[DE94-757270] p 3697 N94-32917

COBALT COMPOUNDS
Molecular/polymeric magnetism
[DE94-005888] p 3649 N94-31201
The relative performance of FeS2 and CoS in long-life thermal-battery applications
[DE94-006145] p 3695 N94-32663

COBALT OXIDES
Compositions and chemical bonding in ceramics by quantitative electron energy-loss spectrometry
[DE94-007208] p 3659 N94-32640

COCKPITS
Development of a reconfigurable helicopter flight control system
[ISBN-0-315-87218-7] p 3585 N94-31837
Study of virtual prototyping of aircraft instruments
[CMC-0687-1090] p 3581 N94-31903
Cockpit Electronic Display Workshop: Proceedings (computer diskette)
[AD-M000330] p 3805 N94-33171
Cockpit Electronic Display Workshop: A synopsis
[AD-A277728] p 3583 N94-33280

CODERS
Noise cancellation for CELP voice encoders in an F/A-18 noise environment
[AD-A277652] p 3683 N94-33026

CODING
Modulation and coding for the Gaussian channel, possibly affected by fluctuations
[TELECOM-93-E-009] p 3840 N94-31169
Waveform generation for ultra-wideband radar system
[AD-A276352] p 3673 N94-31401
Morphological directional coding of images
[ISBN-0-315-86336-6] p 3814 N94-31715
Beginning the 21st century with advanced Automatic Parts Identification (API) p 3923 N94-32444
The trustworthy digital camera: Restoring credibility to the photographic image p 3714 N94-32470
MOM3D method of moments code theory manual
[NASA-CR-189594] p 3682 N94-32897
Noise cancellation for CELP voice encoders in an F/A-18 noise environment
[AD-A277652] p 3683 N94-33026

COERCIVITY
The ferroelectric behavior of odd-numbered nylons
[AD-A278126] p 3663 N94-33058

COGNITION
Concepts and environment
[REPT-93-032] p 3829 N94-31186
Reminding-based learning
[AD-A277424] p 3801 N94-32997

COGNITIVE PSYCHOLOGY
Concepts and environment
[REPT-93-032] p 3829 N94-31186
Reading: Interaction with memory
[AD-A277547] p 3801 N94-32956

COHERENT RADAR
Comparison of coherent to incoherent detection at 2.09 micrometers using a solid state LADAR system
[AD-A277159] p 3721 N94-33102

COLD FLOW TESTS
Design of a cold-flow test facility for the high pressure fuel turbopump turbine of the Space Shuttle main engine
[AD-A276743] p 3615 N94-32182

COLD NEUTRONS
Fusion with highly spin polarized HD and D2
[DE94-006209] p 3876 N94-32731

COLD PLASMAS
Time domain spectroscopy for studying a monopole antenna immersed in a plasma
[ISBN-0-315-86526-1] p 3888 N94-31727

COLD ROLLING
Lubrication with binary mixtures: Liquid-liquid emulsion in elastohydrodynamics and metal forming
p 3658 N94-32490

COLD TOLERANCE
Review of pharmacological approach to improve cold tolerance p 3796 N94-31740
Lipid metabolism in cold-exposed humans
p 3796 N94-31741
Validation and sensitivity analysis of Texas human thermal model predictions during cold water immersion
[AD-A275240] p 3797 N94-32156
Numerical model of the thermal behavior of an extremity in a cold environment including counter-current heat exchange between the blood vessels
[AD-A278099] p 3798 N94-33040

COLD WATER
Validation and sensitivity analysis of Texas human thermal model predictions during cold water immersion
[AD-A275240] p 3797 N94-32156

COLD WORKING
Feasibility study of cold expansion processes modelling
[DSIS-94-01186] p 3735 N94-31849

COLLIMATION
Passive, multi-channel fiber optic rotary joint assembly
[AD-D016116] p 3882 N94-32626

COLLISION AVOIDANCE
Contingency-tolerant robot motion planning and control p 3830 N94-31482
Penetration distances and their applications to path planning p 3858 N94-31725
Three dimensional audio versus head down TCAS displays
[NASA-CR-177636] p 3576 N94-33063

COLLISION RATES
Constraints on the Martian cratering rate imposed by the SNC meteorites and Vallis Marineris layered deposits p 3945 N94-33197

COLLOIDS
Preparation of catalyst particles using methods of colloid chemistry. Part 1: Preparation of silica particles from alcohol solutions
[PB94-135597] p 3634 N94-31679
The sol-gel-xerogel transition
[AD-A276647] p 3616 N94-32038

COLOR
A search for rapidity gaps in jet events and a study of color coherence in multijet events at D0
[DE94-006849] p 3872 N94-32627
Global color views of Mars p 3948 N94-33217

COLOR CODING
A visual detection model for DCT coefficient quantization p 3850 N94-32467

COLOR VISION
Visual neural development and chromatic aberration
[AD-A277402] p 3800 N94-32345

COLOR-MAGNITUDE DIAGRAM
Study of stellar associations located in the region contained between the Magellanic Clouds
[ISBN-0-315-86692-6] p 3935 N94-31913

COLUMBUS SPACE STATION
Development concept for Dutch user support
[PB94-125523] p 3598 N94-31208

COMBINATORIAL ANALYSIS
On the use of genetic algorithms to solve the time-table problem
[REPT-90-060-REV] p 3829 N94-31176
The ant system: An autocatalytic optimizing process
[REPT-91-016-REV] p 3824 N94-31177
Combinatorial ion sensors
[AD-A276567] p 3825 N94-32032
Some problems of applied algebra
[CWI-AM-R9306] p 3847 N94-32204
Combinatory reduction systems: Introduction and survey
[CWI-CS-R9362] p 3849 N94-32349
Implementation and display of Computer Aided Design (CAD) models in Monte Carlo radiation transport and shielding applications
[DE94-007221] p 3819 N94-32641
On the computation of simplical approximations of implicitly defined two-dimensional manifolds
[AD-A278132] p 3849 N94-33060

COMBUSTIBLE FLOW
A numerical method for mixing/chemically reacting compressible flow with finite rate chemistry
p 3634 N94-31824
Advanced CFD methodology for fast transients encountered in nonlinear combustion instability problems. Volume 1: Theory and validation
[NASA-CR-191351] p 3637 N94-32696

COMBUSTION
NATO Advanced Study Institute on Unsteady Combustion. Volume 2: Research papers, September 6-17, 1993
[AD-A276572] p 3634 N94-32033
Studies in physico-chemical hydrodynamics of extended systems
[DE94-006752] p 3706 N94-32149
Volatiles combustion in fluidized beds
[DE94-008382] p 3636 N94-32414
Rate coefficient for the reaction H + O2 yields OH + O: Results from 2000 to 5300 K
[DE94-008105] p 3871 N94-32615
Ionization probes of molecular structure and chemistry
[DE94-007605] p 3872 N94-32643

COMBUSTION CHAMBERS
Combustor and nozzle effects on particulate behavior in solid rocket motors
[AD-A277304] p 3614 N94-32071

COMBUSTION CHEMISTRY
Fuel property effects on engine combustion processes
[DE94-005529] p 3631 N94-31153
Ignition studies in nonpremixed hydrogen/air combustion
[AD-A275954] p 3632 N94-31348
Combustion-related studies using weakly-bonded complexes
[DE94-006632] p 3633 N94-31493
Analysis of forward and inverse problems in chemical dynamics and spectroscopy
[DE94-007607] p 3635 N94-32140
Rate coefficient for the reaction H + O2 yields OH + O: Results from 2000 to 5300 K
[DE94-008105] p 3871 N94-32615

COMBUSTION CONTROL
Volatiles combustion in fluidized beds
[DE94-008382] p 3636 N94-32414

COMBUSTION PHYSICS
Computational study of single-expansion-ramp nozzles with external burning
[NASA-TM-106550] p 3700 N94-31229
Ignition studies in nonpremixed hydrogen/air combustion
[AD-A275954] p 3632 N94-31348
Analysis of strong acoustic excitation on the breakup and dispersion of a liquid jet
[ONERA-NT-1993-9] p 3701 N94-31422
A numerical method for mixing/chemically reacting compressible flow with finite rate chemistry
p 3634 N94-31824
Solid surface
[NASA-TM-109746] p 3634 N94-31883
Volatiles combustion in fluidized beds
[DE94-008382] p 3636 N94-32414

COMBUSTION PRODUCTS
Emissions of greenhouse gases from the use of transportation fuels and electricity
[DE94-006166] p 3765 N94-31625
Photothermal laser deflection, an innovative technique to measure particles in exhausts
[AD-A277151] p 3718 N94-32366
CET93 and CETPC: An interim updated version of the NASA Lewis computer program for calculating complex chemical equilibria with applications
[NASA-TM-4557] p 3636 N94-32948
Exposure assessment of JAVELIN missile combustion products
[AD-A278128] p 3616 N94-33059

COMBUSTION STABILITY
Analysis of strong acoustic excitation on the breakup and dispersion of a liquid jet
[ONERA-NT-1993-9] p 3701 N94-31422
Advanced CFD methodology for fast transients encountered in nonlinear combustion instability problems. Volume 2: User's guide
[NASA-CR-191352] p 3637 N94-32694
Advanced CFD methodology for fast transients encountered in nonlinear combustion instability problems. Volume 1: Theory and validation
[NASA-CR-191351] p 3637 N94-32696

COMETARY ATMOSPHERES
Cometary molecules p 3935 N94-31869
Composition and properties of dust from Comet Halley
p 3936 N94-31947

COMETS
Cometary molecules p 3935 N94-31869

COMFORT
A pilot study of comfort criteria and sound quality metrics for sound inside cabins of propeller-driven aircraft
[CTH-F-93-03] p 3859 N94-31090
THE VERTICAL p 3806 N94-32435

COMMAND AND CONTROL
Evolving software reengineering technology for the emerging innovative-competitive era
p 3823 N94-32439

COMMAND GUIDANCE
An experimental study of pilot/vehicle dynamics using a tilt rotor flying machine
[AD-A277516] p 3805 N94-33349
COMMERCIAL AIRCRAFT
A laboratory study of multiple site damage in fuselage lap splices
[AD-A276151] p 3578 N94-31078
Fracture and fatigue strength evaluation of multiple site damaged aircraft fuselages - curved panel testing and analysis
[AD-A277100] p 3579 N94-32015
A comparison of military and commercial aircraft development
[AD-A276830] p 3575 N94-32168
COMMODITIES
Knowledge-based commodity distribution planning
p 3915 N94-32427
COMMUNICATION EQUIPMENT
Communications networks in stressed environments
[AD-A275967] p 3672 N94-31384
Electronic mail and organizational knowledge: Media use in a global corporation
[AD-A276707] p 3678 N94-32121
COMMUNICATION NETWORKS
Acquisition information management system telecommunication site survey results
[DE94-005688] p 3915 N94-31155
Putting the information infrastructure to work: Report of the Information Infrastructure Task Force Committee on Applications and Technology
[NIST/SP-857] p 3916 N94-31228
Spread-spectrum radio systems and networks
[AD-A276449] p 3671 N94-31260
Advanced optical fiber communication systems
[AD-A276416] p 3878 N94-31330
Communications networks in stressed environments
[AD-A275967] p 3672 N94-31384
A multichannel architecture for Naval Task Force Communication
[AD-A276230] p 3673 N94-31446
Analysis of the effect of routing strategies for parallel implementations of a selected avionics application
[AD-A276069] p 3581 N94-31458
Study of structures of different complexity for the communication between two processors
[ETN-94-95750] p 3674 N94-31615
Welcome to the Ohio Aerospace Institute
[NASA-TM-109756] p 3913 N94-31815
The vision machines
[NASA-TM-109757] p 3806 N94-31816
Problems in survivable multi-media networks
[AD-A277370] p 3825 N94-32052
Performance metrics for low probability of intercept-communication system
[AD-A277346] p 3677 N94-32073
Discrete-event-dynamic-system-based approaches for scheduling transmissions in multihop packet radio networks
[AD-A276566] p 3679 N94-32230
Design, development, and testing of a Network Frequency Selection Service (NFSS)
[AD-A277362] p 3680 N94-32283
Control and reliability of optical networks in multiprocessors
[AD-A277385] p 3881 N94-32285
Communication networks for autonomous mobile robot computer architectures and distributed real-time computing p 3680 N94-32310
Voice and video transmission using XTP and FDDI
p 3685 N94-32468
Using the National Information Infrastructure for social science, education, and informed decision making
[DE94-005442] p 3920 N94-32676
Information systems to enhance technology exchange
[DE94-007744] p 3920 N94-32808
Multicast communication with guaranteed quality of service
[AD-A277650] p 3682 N94-33025
Reliable communication in the presence of severe noise or jamming
[AD-A278410] p 3684 N94-33173
MARSNET: A European network of stations on the surface of Mars p 3945 N94-33199
Assessing the vulnerability of multi-commodity networks with failing components
[AD-A278434] p 3684 N94-33334
COMMUNICATION SATELLITES
Multisatellite constellation configuration selection for multiregional highly elliptical orbit constellations
p 3600 N94-31437
Satellite communications industry
[AD-A276685] p 3610 N94-32039
An analysis of cellular telephone and INMARSAT systems for providing radio data link computer communications for US Navy vessels
[AD-A278143] p 3684 N94-33160
COMMUNICATION THEORY
Updates in dynamic semantics
[LP-93-06] p 3856 N94-31450
Assessing the vulnerability of multi-commodity networks with failing components
[AD-A278434] p 3684 N94-33334
COMPANION STARS
Evolution of dynamo-generated magnetic fields in accretion disks around compact and young stars
p 3931 N94-31138
Digital image profilers for detecting faint sources which have bright companions
[NASA-CR-191348] p 3927 N94-32695
COMPARATORS
An analog preprocessing architecture for high-speed analog-to-digital conversion
[AD-A276737] p 3807 N94-32163
COMPARISON
Finding all periods and initial palindromes of a string in parallel
[AD-B175069] p 3827 N94-33002
COMPASSES
Relative motion pinwheel
[AD-D016107] p 3577 N94-32961
COMPATIBILITY
Design patterns mixing genericity and inheritance in the development of reusable components
[REPT-93-021] p 3808 N94-31178
A compatibility study of FEFO with various containment materials
[DE94-005753] p 3649 N94-31198
Compatibility studies of some azo polymer blends
[AD-A277141] p 3657 N94-32365
Characterization of thermally stable dye-doped polyimide based electrooptic materials
[DE94-005309] p 3882 N94-32674
COMPILERS
Compiler techniques for managing data motion
[AD-A276514] p 3918 N94-31930
Incremental recompilation for Standard ML of New Jersey
[AD-A276522] p 3815 N94-32080
Utility-based planning
[NASA-CR-195878] p 3816 N94-32086
Informal introduction to the extended affix grammar formalism and its compiler
[TR-93-19] p 3817 N94-32287
Construction of a parallel processor for simulating manipulators and other mechanical systems
[NASA-CR-191327] p 3826 N94-32482
COMPLETENESS
Lambek calculus is L-complete
[LP-93-14] p 3841 N94-31388
COMPLEX COMPOUNDS
Recent developments in polymeric charge transfer complexes
[AD-A277108] p 3654 N94-31979
Wave packet studies of the vibrational predissociation of three and four-atom van der Waals complexes
[DE94-007623] p 3871 N94-32598
Ligand intermediates in metal-catalyzed reactions
[DE94-008713] p 3638 N94-32887
COMPLEX SYSTEMS
Effective computational strategy for predicting the response of complex systems
[AD-A277452] p 3740 N94-33011
Design and Monte Carlo analysis of an unmanned aerial vehicle
[AD-A277648] p 3580 N94-33056
COMPLEX VARIABLES
On the computation of simplical approximations of implicitly defined two-dimensional manifolds
[AD-A276132] p 3849 N94-33060
COMPONENT RELIABILITY
Stochastic models in reliability theory
[AD-A277529] p 3731 N94-32953
Assessing the vulnerability of multi-commodity networks with failing components
[AD-A278434] p 3684 N94-33334
COMPOSITE MATERIALS
Low-Earth orbit effects on organic composite materials flown on LDEF p 3595 N94-31036
Performance predictions for composite materials
[AD-A276451] p 3618 N94-31261
Electromagnetic scattering through loaded aperture panels with nonzero contact impedance
[ONERA-NT-1993-2] p 3673 N94-31418
Damage tolerance aspects of a full composite airplane fuselage: Requirements, modelling, predictions, experiments
[LR-728] p 3578 N94-31674
Micromechanics and effective properties of particulate composites and fluid suspensions p 3703 N94-31744
Optimization of composite material failure loads
[ISBN-0-315-87214-4] p 3621 N94-31836
Location of impact damage sites in composite aircraft structures, task 3.4.1
[DSIS-94-01590] p 3621 N94-31892
Benchmarking of the state-of-the-art in nondestructive testing/evaluation for applicability in the Composite Armored Vehicle (CAV) Advanced Technology Demonstrator (ATD) program, phase 1
[AD-A276660] p 3730 N94-32088
Nonlinear optical polymers derived from organic/inorganic composites
[AD-A277408] p 3659 N94-32610
Development of thermoplastic composite aircraft structures
[NASA-CR-189593] p 3626 N94-32860
Innovative fabrication processing of advanced composite materials concepts for primary aircraft structures
[NASA-CR-189558] p 3626 N94-32877
Second NASA Advanced Composites Technology Conference
[NASA-CP-3154] p 3627 N94-33121
COINS: A composites information database system
p 3627 N94-33123
Resin transfer molding for advanced composite primary wing and fuselage structures p 3628 N94-33128
Tension fracture of laminates for transport fuselage. Part 1: Material screening p 3629 N94-33130
Recent progress in NASA Langley Research Center textile reinforced composites program
p 3629 N94-33134
Ceramic and metal composite circuit-board-level technology for application specific electronic modules (ASEM)
[AD-A277961] p 3630 N94-33180
Lightweight zinc electrode
[AD-D016181] p 3698 N94-33181
Novel sol-gel deposition for repair of conducting paths in polyceramic systems
[AD-A278381] p 3664 N94-33350
COMPOSITE STRUCTURES
Ultrasonic characterization of damage in a simulated CF-18 composite structure
[DREP-LN-93-26] p 3730 N94-31872
Finite element analysis of damage in fibrous composites using a micromechanical model
[AD-A277226] p 3623 N94-32024
Benchmarking of the state-of-the-art in nondestructive testing/evaluation for applicability in the Composite Armored Vehicle (CAV) Advanced Technology Demonstrator (ATD) program, phase 1
[AD-A276660] p 3730 N94-32088
Assessment of impact damage in composite structures
[AD-A277063] p 3624 N94-32265
Development of thermoplastic composite aircraft structures
[NASA-CR-189593] p 3626 N94-32860
Application of a design-build-team approach to low cost and weight composite fuselage structure
[NASA-CR-4418] p 3626 N94-32863
Analysis of new composite architectures
[NASA-CR-195303] p 3626 N94-32904
Effective computational strategy for predicting the response of complex systems
[AD-A277452] p 3740 N94-33011
Second NASA Advanced Composites Technology Conference
[NASA-CP-3154] p 3627 N94-33121
Composite fuselage shell structures research at NASA Langley Research Center p 3628 N94-33124
Structural testing of the technology integration box beam p 3628 N94-33125
Technology integration box beam failure study
p 3628 N94-33126
Resin transfer molding for advanced composite primary wing and fuselage structures p 3628 N94-33128
Test and analysis results for composite transport fuselage and wing structures p 3628 N94-33129
Local design optimization for composite transport fuselage crown panels p 3629 N94-33132
Composite fuselage crown panel manufacturing technology p 3629 N94-33133
Advanced textile applications for primary aircraft structures p 3629 N94-33135
Characterization and manufacture of braided composites for large commercial aircraft structures
p 3630 N94-33137
Leveraging metal matrix composites to reduce costs in space mechanisms p 3604 N94-33301
COMPOSITION (PROPERTY)
Dielectric properties of Mars' surface: Proposed measurement on a Mars lander p 3951 N94-33237

COMPRESSIBLE BOUNDARY LAYER
Computation of three-dimensional compressible boundary layers to fourth-order accuracy on wings and fuselages
[NASA-CR-4269] p 3709 N94-32871
COMPRESSIBLE FLOW
A priori tests of large eddy simulation of the compressible plane mixing layer
[MEMO-1152] p 3699 N94-31185
An adaptive finite element method for unsteady compressible rotor airfoil aerodynamics
p 3567 N94-31204
Compressible convection with ionization
p 3911 N94-31498
Cell-vertex discretisation of the driven cavity flow without artificial diffusion
[W-9317] p 3703 N94-31689
Finite element vorticity-based methods for the solution of the incompressible and compressible Navier-Stokes equations
[ISBN-0-315-87265-9] p 3703 N94-31730
A numerical method for mixing/chemically reacting compressible flow with finite rate chemistry
p 3634 N94-31824
Solution of the average-passage equations for the incompressible flow through multiple-blade-row turbomachinery
[AD-A276515] p 3583 N94-31931
Multigrid diagonal implicit solutions for compressible turbulent flows and their evaluation
p 3705 N94-31941
High-resolution numerical methods for compressible multi-phase flow in hierarchical porous media
[DE94-008261] p 3707 N94-32410
Direct replacement of arbitrary grid-overlapping by non-structured grid
[NASA-TM-106601] p 3850 N94-33120
COMPRESSION LOADS
Elastic modulus measurements of LDEF glasses and glass-ceramics using a speckle technique
[NASA-CR-195911] p 3653 N94-31851
COMPRESSION TESTS
Unidirectional composites compressive behaviour: Test methods and micromechanical approach
[ONERA-NT-1993-10] p 3618 N94-31232
Comparison of the compressive strengths for stitched and toughened composite systems
[NASA-TM-109108] p 3627 N94-32939
Test and analysis results for composite transport fuselage and wing structures p 3628 N94-33129
COMPRESSIVE STRENGTH
Evaluation of nondestructive inspection techniques for quality control of alumina-ceramic housing components
[AD-A276220] p 3730 N94-31065
Comparison of the compressive strengths for stitched and toughened composite systems
[NASA-TM-109108] p 3627 N94-32939
Development of stitched/RTM composite primary structures p 3628 N94-33127
COMPRESSOR BLADES
Hotwire measurements of the turbulent flow into a cascade of controlled-diffusion compressor blades
[AD-A277297] p 3706 N94-32042
COMPTON EFFECT
Elimination of two atomic electrons by a single high energy photon
[DE94-006834] p 3864 N94-31320
COMPUTATION
Design and analysis of scalable parallel algorithms
[AD-A276255] p 3809 N94-31251
List ranking and list scan on the CRAY C-90
[AD-A276411] p 3824 N94-31259
Mixed 0-1 programming by lift-and-project in a branch-and-cut framework
[AD-A278045] p 3822 N94-33183
COMPUTATIONAL ASTROPHYSICS
A heterogeneous computing environment for simulating astrophysical fluid flows p 3928 N94-31119
COMPUTATIONAL CHEMISTRY
A genetic algorithm based method for docking flexible molecules
[DE94-007525] p 3793 N94-32269
Computational chemistry on parallel computers
[DE94-008106] p 3636 N94-32616
Molecular interactions in dilute supercritical mixtures: Molecular dynamics investigation
[DE94-007610] p 3872 N94-32644
Computed potential energy surfaces for chemical reactions
[NASA-CR-195835] p 3639 N94-33036
COMPUTATIONAL FLUID DYNAMICS
CFD-based drag prediction: State-of-the-art, theory, prospects
[AD-B179297] p 3567 N94-31180
A solution adaptive structured-unstructured grid procedure for unsteady flows p 3700 N94-31217
Prediction of transonic potential flow with slipstreams around configurations
[FFA-TN-1992-15] p 3568 N94-31220
Numerical analysis of single-vortex/free-surface interaction
[AD-A276462] p 3701 N94-31241
Grid sensitivity for aerodynamic optimization and flow analysis p 3568 N94-31287
Experimental and numerical simulation of helicopter rotor fuselage interaction
[ONERA-NT-1993-8] p 3568 N94-31421
Additional capabilities of the unified waves model
[AD-A276114] p 3702 N94-31467
Fluid-structure interaction in case of water hammer with cavitation
[PB94-148277] p 3702 N94-31588
Aeroacoustic sources in internal flows
[ISBN-9-03-86-0282-0] p 3860 N94-31653
Solution of the incompressible Navier-Stokes equations in general coordinates by Krylov subspace and multigrid methods
[REPT-93-64] p 3703 N94-31660
Cell-vertex discretisation of the driven cavity flow without artificial diffusion
[W-9317] p 3703 N94-31689
Simulations of the creation and motion of vortex rings
[W-9319] p 3703 N94-31691
Finite element vorticity-based methods for the solution of the incompressible and compressible Navier-Stokes equations
[ISBN-0-315-87265-9] p 3703 N94-31730
Numerical simulation of combined external/internal transonic flow on the forebody/inlet of the AV-8B Harrier 2 p 3569 N94-31759
Pulsed expansion of plasma in a magnetic thruster
p 3889 N94-31776
Incompressible viscous flow in tubes with occlusions
[ISBN-0-315-75467-2] p 3704 N94-31778
On an adaptation method for 2-dimensional C-type grids
[W-9322] p 3569 N94-31822
A new inverse method for generating high-speed aerodynamic flows with application to waverider design
p 3569 N94-31828
Computational study of simultaneous heat and mass transfer in turbulent separated flows
p 3704 N94-31843
Boundary layer study on nozzle wall at hypersonic velocities p 3569 N94-31882
Solution of the average-passage equations for the incompressible flow through multiple-blade-row turbomachinery
[AD-A276515] p 3583 N94-31931
Multigrid diagonal implicit solutions for compressible turbulent flows and their evaluation
p 3705 N94-31941
Large-scale shape optimization: Numerical methods, parallel algorithms, and applications to aerodynamic design p 3815 N94-31966
A study of the development and attenuation of wing-generated, vortical wakes p 3570 N94-31971
Incorporating radial mixing in axisymmetric streamline curvature through-flow analysis
[AD-A277325] p 3706 N94-32279
A critical evaluation of methods for imposing solid-wall boundary conditions in inviscid flow
[AD-A276959] p 3707 N94-32361
A novel potential/viscous flow coupling technique for computing helicopter flow fields
[NASA-CR-193272] p 3571 N94-32476
Additive turbulent decomposition of the incompressible and compressible Navier-Stokes equations
[AD-A277321] p 3708 N94-32511
Analysis and computation for vortex dynamics and rarefied gases
[AD-A277415] p 3708 N94-32581
Advanced CFD methodology for fast transients encountered in nonlinear combustion instability problems. Volume 1: Theory and validation
[NASA-CR-191351] p 3637 N94-32696
Numerical analysis of transonic wing buffet
p 3586 N94-32713
Boundary element analysis of three-dimensional nonlinear hydrodynamics in a reduced gravity environment p 3868 N94-32715
Computation of three-dimensional compressible boundary layers to fourth-order accuracy on wings and fuselages
[NASA-CR-4269] p 3709 N94-32871
A mathematical model for simulating noise suppression of lined ejectors
[NASA-TP-3425] p 3861 N94-32930
Modification of the MML turbulence model for adverse pressure gradient flows
[NASA-TM-106544] p 3709 N94-32947
Fourth-order 2N-storage Runge-Kutta schemes
[NASA-TM-109112] p 3573 N94-32950
Institute for Computational Mechanics in Propulsion (ICOMP)
[NASA-TM-106542] p 3710 N94-32969
Parallel supercomputing: Advanced methods, algorithms, and software for large-scale linear and nonlinear problems
[DE94-008446] p 3836 N94-32992
Direct replacement of arbitrary grid-overlapping by non-structured grid
[NASA-TM-106601] p 3850 N94-33120
Computational methods in continuum mechanics
[AD-A278144] p 3859 N94-33161
A study of weak solutions and their regularizations by numerical methods
[AD-A277453] p 3850 N94-33175
Cumulative reports and publications through December 31, 1993
[NASA-CR-194889] p 3806 N94-33286
COMPUTATIONAL GEOMETRY
Abstracts of the Workshop on Computational Geometry (CG 1992)
[PB94-147022] p 3844 N94-31684
Mesh optimization
[AD-A277644] p 3820 N94-32972
On the computation of simplical approximations of implicitly defined two-dimensional manifolds
[AD-A278132] p 3849 N94-33060
Least squares approximation by G1 piecewise parametric cubes
[AD-A277978] p 3850 N94-33265
COMPUTATIONAL GRIDS
A priori tests of large eddy simulation of the compressible plane mixing layer
[MEMO-1152] p 3699 N94-31185
A solution adaptive structured-unstructured grid procedure for unsteady flows p 3700 N94-31217
Grid sensitivity for aerodynamic optimization and flow analysis p 3568 N94-31287
Abstracts of the Workshop on Computational Geometry (CG 1992)
[PB94-147022] p 3844 N94-31684
Cell-vertex discretisation of the driven cavity flow without artificial diffusion
[W-9317] p 3703 N94-31689
On an adaptation method for 2-dimensional C-type grids
[W-9322] p 3569 N94-31822
On an adaptation method for dense, 2D, C-type grids
[W-9321] p 3706 N94-32045
Polynomial interpolation and approximation of real functions. 2: Symmetrical interpolation for the triangle
[AD-A277345] p 3848 N94-32245
Eta percent-superconvergence in the interior of locally refined meshes of quadrilaterals: Superconvergence of the gradient in finite element solutions of Laplace's and Poisson's equations
[AD-A277242] p 3848 N94-32331
New advances in the modeling of high-temperature superconductors
[DE94-007649] p 3905 N94-32815
Statistical intercomparison of global climate models: A common principal component approach
[DE94-008671] p 3768 N94-32882
Incremental triangulation by way of edge swapping and local optimization
[NASA-TM-103979] p 3709 N94-32948
Mesh optimization
[AD-A277644] p 3820 N94-32972
Parallel supercomputing: Advanced methods, algorithms, and software for large-scale linear and nonlinear problems
[DE94-008446] p 3836 N94-32992
Transformation of two and three-dimensional regions by elliptic systems
[NASA-CR-195849] p 3821 N94-33049
Direct replacement of arbitrary grid-overlapping by non-structured grid
[NASA-TM-106601] p 3850 N94-33120
COMPUTER AIDED DESIGN
Interactive reconstruction of anatomical structures with free-form surfaces
[TELECOM-93-E-002] p 3794 N94-31195
AGARD highlights 94/1, April 1994
[AGARD-HIGHLIGHTS-94/1] p 3956 N94-31196
Grid sensitivity for aerodynamic optimization and flow analysis p 3568 N94-31287
A comparison of product realization frameworks
[AD-A275992] p 3810 N94-31357
A model and algorithms for a software evolution control system
[AD-A276431] p 3811 N94-31449
Module generation for self-testing integrated systems
[ISBN-9-09-004570-8] p 3688 N94-31520

Extension of the LUSTRE language and application to circuit design: The LUSTRE V4 language and the POLLUX system
[ETN-94-95918] p 3812 N94-31543
GKS-9X: An experimental application
[PB94-147048] p 3813 N94-31685
Designing in virtual reality: Modelling Objects in a Virtual Environment (MOVE)
[REPT-93-91] p 3813 N94-31704
CAD-based off-line planning for an active-vision system
[ISBN-0-315-86317-X] p 3813 N94-31713
A new inverse method for generating high-speed aerodynamic flows with application to waverider design p 3569 N94-31828
Multidisciplinary optimization of high-speed civil transport configurations using variable-complexity modeling p 3578 N94-31881
Study of virtual prototyping of aircraft instruments
[CMC-0687-1090] p 3581 N94-31903
The Second International Workshop on Discrete Time Domain Modelling of Electromagnetic Fields and Networks. Program and information
[AD-A277136] p 3677 N94-32067
An analog preprocessing architecture for high-speed analog-to-digital conversion
[AD-A276737] p 3807 N94-32163
Interactive graphical model building using telepresence and virtual reality
[DE94-001421] p 3818 N94-32353
Analytical Design Package (ADP2): A computer aided engineering tool for aircraft transparency design p 3823 N94-32430
CONFIG: Integrated engineering of systems and their operation p 3823 N94-32432
Evolving software reengineering technology for the emerging innovative-competitive era p 3823 N94-32439
The role of guideline-based design tools
[DE94-007482] p 3804 N94-32596
Implementation and display of Computer Aided Design (CAD) models in Monte Carlo radiation transport and shielding applications
[DE94-007221] p 3819 N94-32641
The limits of intelligence in design
[DE94-004668] p 3819 N94-32668
On the computation of simplical approximations of implicitly defined two-dimensional manifolds
[AD-A278132] p 3849 N94-33060
Designer's unified cost model p 3627 N94-33122
COINS: A composites information database system p 3627 N94-33123
Least squares approximation by G1 piecewise parametric cubes
[AD-A277978] p 3850 N94-33265

COMPUTER AIDED MANUFACTURING

A comparison of product realization frameworks
[AD-A275992] p 3810 N94-31357
An application reference model for layered manufacturing
[DE94-006368] p 3811 N94-31484

COMPUTER AIDED MAPPING

SPOT imagery for updating land cover information of 1:50,000 numerical topographic maps p 3749 N94-32532

COMPUTER AIDED TOMOGRAPHY

Fast nonsupervised 3D registration of PET and MR images of the brain
[TELECOM-93-C-006] p 3798 N94-33069

COMPUTER ASSISTED INSTRUCTION

A systems approach to computer-based training p 3823 N94-32436
Literacy: A multimedia adult literacy package combining NASA technology, recursive ID theory, and authentic instruction theory p 3924 N94-32462
Virtual reality in medical education and assessment p 3798 N94-32471
On the use of computers for teaching fluid mechanics
[NASA-TM-106587] p 3820 N94-32773
An evaluation framework for designing a night vision, computer-based trainer
[AD-A278005] p 3590 N94-33139

COMPUTER COMPONENTS

VLSI for high-speed digital signal processing
[AD-A277617] p 3697 N94-32957

COMPUTER DESIGN

Delft Ising computing engine
[PB94-148251] p 3806 N94-31587
Control and reliability of optical networks in multiprocessors
[AD-A277385] p 3881 N94-32285
Formal semantics for a subset of VHDL and its use in analysis of the FTPP scoreboard circuit
[NASA-CR-191577] p 3827 N94-32734
Investigation of modularly configured attached processors with intelligent memories
[AD-A278418] p 3839 N94-33330

COMPUTER GRAPHICS

Interactive reconstruction of anatomical structures with free-form surfaces
[TELECOM-93-E-002] p 3794 N94-31195
Description of a package for the analysis and display of the results of numerical simulations
[AD-A276285] p 3841 N94-31252
Texture generation on irregular regions
[AD-A275999] p 3841 N94-31359
GKS-9X: An experimental application
[PB94-147048] p 3813 N94-31685
Texture library for 3-dimensional visualization systems
[AD-A276125] p 3917 N94-31829
Visual evaluation of computor-generated textures
[AD-A277201] p 3816 N94-32093
Applications of data compression to 3-D scalar field visualization p 3817 N94-32294
Interactive graphical model building using telepresence and virtual reality
[DE94-001421] p 3818 N94-32353
Design of graphic screens using Neuro Linguistic Programming
[DE94-007634] p 3819 N94-32599
Mesh optimization
[AD-A277644] p 3820 N94-32972
Least squares approximation by G1 piecewise parametric cubes
[AD-A277978] p 3850 N94-33265

COMPUTER INFORMATION SECURITY

Acquisition information management system telecommunication site survey results
[DE94-005688] p 3915 N94-31155
Covert channel analysis of trusted systems. A guide to understanding
[AD-A276418] p 3916 N94-31331
On the validity of the BLP model
[REPT-93-70] p 3917 N94-31640
PEM public key certificate cache server
[DE94-006404] p 3675 N94-31784
The FELICIA bulletin board system and the IRBIS anonymous FTP server: Computer security information sources for the DOE community
[DE94-008219] p 3825 N94-31920
Integrated Trusted System Development Environment Process
[AD-A276414] p 3816 N94-32131
The Operator Shell: A means of privilege distribution under Unix
[DE94-007566] p 3826 N94-32356

COMPUTER NETWORKS

Sandia's research network for Supercomputing 1993: A demonstration of advanced technologies for building high-performance networks
[DE94-005319] p 3823 N94-31149
Acquisition information management system telecommunication site survey results
[DE94-005688] p 3915 N94-31155
Putting the information infrastructure to work: Report of the Information Infrastructure Task Force Committee on Applications and Technology
[NIST/SP-857] p 3916 N94-31228
Performability modelling using DyQNtool+
[MEMO-INF-93-45] p 3812 N94-31659
Using atomic actions in replica groups to simplify the replication implementation
[REPT-93-78] p 3813 N94-31695
The vision machines
[NASA-TM-109757] p 3806 N94-31816
Selection of climate station data using clustering and triangulated irregular network techniques
[AD-A276658] p 3784 N94-32046
Problems in survivable multi-media networks
[AD-A277370] p 3825 N94-32052
The use of service limits for efficient operation of multi-station single-medium communication systems
[CWI-BS-R9312] p 3677 N94-32085
Undiscounted Markov decision chains with partial information; an algorithm for computing a locally optimal periodic policy
[TW-93-10] p 3851 N94-32205
Parallel and distributed computing combinatorial algorithms
[AD-A277333] p 3826 N94-32243
IRIG J asynchronous ASCII time code formats
[AD-A277244] p 3681 N94-32332
Automated mainframe data collection in a network environment p 3923 N94-32443
High performance real-time flight simulation at NASA Langley p 3591 N94-32473
Gigabits to the Desktop: Installing tomorrow's networks today
[DE94-007701] p 3827 N94-32646
Use and administration of UNIX (tm) systems p 3821 N94-33051

COMPUTER PROGRAMMING

Discovery systems for manufacturing
[AD-A276216] p 3828 N94-31061
Developing the Multimedia User Interface Component (MUSIC) for the Icarus Presentation System (IPS)
[AD-A276341] p 3810 N94-31335
E-L user's manual
[AD-A276378] p 3810 N94-31370
The development and use of an evaluation mechanism for the assessment of software configuration management tools
[AD-A275961] p 3810 N94-31383
Segment-based acoustic models for continuous speech recognition
[AD-A276109] p 3673 N94-31466
GKS-9X: An experimental application
[PB94-147048] p 3813 N94-31685
Design Methods based On Nets: DEMON
[PB94-147493] p 3813 N94-31687
Overview of megaprogramming course: Lectures and exercises
[AD-A276169] p 3814 N94-31810
On the convergence of stochastic iterative dynamic programming
[AD-A276517] p 3815 N94-31933
Incremental recompilation for Standard ML of New Jersey
[AD-A276522] p 3815 N94-32080
Integrated Trusted System Development Environment Process
[AD-A276414] p 3816 N94-32131
MULTIGRAPH: An architecture for model-based programming. Model-based program synthesis for parallel computing. PREMOS: Programming environment for model-based program synthesis, version 01.00.00
[AD-A276949] p 3817 N94-32219
EVORM: A conceptual modelling technique for evolving application domains
[TR-93-16] p 3918 N94-32290
A hypertext system that learns from user feedback p 3923 N94-32428
Spacecraft On-Board Information Extraction Computer (SOBIEC) p 3808 N94-32433
Evolving software reengineering technology for the emerging innovative-competitive era p 3823 N94-32439
Emacs Lisp in Edwin scheme
[AD-A276721] p 3818 N94-32504
MADE: A Multiple Application Development Environment
[CWI-CS-R9360] p 3822 N94-33097
Increasing the practical impact of formal methods for computer-aided software development: Software slicing, merging and integration
[AD-A277929] p 3822 N94-33179
Structuring Z specifications with views
[AD-A277618] p 3822 N94-33279

COMPUTER PROGRAMS

Summary of some data processing routines in the molecular physics group of Stockholm University
[USIP-93-05] p 3808 N94-31087
Model updating of vibrating systems based on measured or calculated frequency response functions
[CTH-E-93-03] p 3732 N94-31091
Standardization and intellectual property control: A reflection on the informatics case
[TELECOM-93-E-016] p 3915 N94-31172
Guide to software quality assurance
[ESA-PSS-05-11-ISSUE-1] p 3809 N94-31223
Computer implementation of Arnott's formulation of thermoacoustics using MATLAB
[AD-A276356] p 3860 N94-31257
Taming chaotic circuits p 3910 N94-31289
An analysis of non-integerizing the aircraft engines Cost Effectiveness Analysis Spreadsheet Model (CEAMOD version 2.0)
[AD-A276251] p 3583 N94-31290
First theory institute on computational differentiation
[DE94-006491] p 3841 N94-31309
OTTER 3.0 reference manual and guide
[DE94-007457] p 3829 N94-31315
Extender's guide for artifacts and drafts
[AD-A276344] p 3810 N94-31328
The High-Frequency Benchmark propagation program
[AD-A276323] p 3672 N94-31334
The maintenance of operational flight program
[AD-A276363] p 3565 N94-31367
Testing Operational Flight Programs (OFP's)
[AD-A276361] p 3578 N94-31387
Direct-sequence spread-spectrum performance in a multipath fading environment
[AD-A276080] p 3673 N94-31464

The future of open architecture process control systems
[DE94-006163] p 3830 N94-31623
Performability modelling using DyQNtool+
[MEMO-INF-93-45] p 3812 N94-31659
Damage tolerance aspects of a full composite airplane fuselage: Requirements, modelling, predictions, experiments
[LR-728] p 3578 N94-31674
Aeroelastic vibrations of lifting surfaces
[ECL-91-01] p 3585 N94-31677
The influence of the deorbit-burn manoeuvre on the footprint of a re-entry capsule
[LR-727] p 3609 N94-31705
Workshop on Models for Plasma Spectroscopy
[AD-A276565] p 3890 N94-32031
Noninvasive spectral analysis and beam mapping of focused ultrasound, part 2
[AD-A276629] p 3861 N94-32059
GRAFTED - GRAphical fault tree EDitor: A fault tree description program for target vulnerability/survivability analysis. User manual
[AD-A277067] p 3818 N94-32390
Heliport Noise Model (HNM) version 2.2 (user's guide)
[AD-A277072] p 3861 N94-32418
A PC program to optimize system configuration for desired reliability at minimum cost p 3823 N94-32438
Evolving software reengineering technology for the emerging innovative-competitive era
p 3823 N94-32439
User's guide for a flat wake rotor inflow/wake velocity prediction code, DOWN
[NASA-TM-104139] p 3572 N94-32873
BUCKY instruction manual, version 3.3
[NASA-TM-104793] p 3820 N94-32899
Manual for automatic generation of finite element models of spiral bevel gears in mesh
[NASA-CR-191009] p 3728 N94-32900
CET93 and CETPC: An interim updated version of the NASA Lewis computer program for calculating complex chemical equilibria with applications
[NASA-TM-4557] p 3638 N94-32948
Theory and application of image enhancement
[AD-A277896] p 3821 N94-33031
Implementing software safety in the NASA environment
[NASA-TM-106597] p 3731 N94-33032
Designer's unified cost model p 3627 N94-33122
Increasing the practical impact of formal methods for computer-aided software development: Software slicing, merging and integration
[AD-A277929] p 3822 N94-33179
Faultless software project
[AD-A278161] p 3822 N94-33188
A user's manual for the cost effectiveness analysis spreadsheet model for aircraft engines (CEAMOD version 2.0)
[AD-A278042] p 3585 N94-33266

COMPUTER STORAGE DEVICES

Extender's guide for artifacts and drafts
[AD-A276344] p 3810 N94-31328
The named-state register file
[AD-A276796] p 3825 N94-32165
Superconducting and semiconducting hybrids and advance memory concepts for superconducting electronics
[AD-A277766] p 3907 N94-32988
SynRGen: An extensible file reference generator
[AD-A277678] p 3821 N94-33030

COMPUTER SYSTEMS DESIGN

Implanting algorithms on parallel machines
[TELECOM-93-D-017] p 3823 N94-31099
LORE and reason maintenance
[REPT-93-88] p 3812 N94-31522
An expert system architecture for heterogeneous domains: A case-study in the legal field
[ETN-94-96012] p 3830 N94-31546
Compositionality of application oriented structuring mechanisms for algebraic specification languages with initial semantics
[ETN-94-95736] p 3812 N94-31577
On the validity of the BLP model
[REPT-93-70] p 3917 N94-31640
Design Methods based On Nets: DEMON
[PB94-147493] p 3813 N94-31687
Designing in virtual reality: Modelling Objects in a Virtual Environment (MOVE)
[REPT-93-91] p 3813 N94-31704
Experiences with EDO: An Evolutionary Database Optimizer
[TR-93-23] p 3918 N94-32105
Parallel and distributed computing combinatorial algorithms
[AD-A277333] p 3826 N94-32243
Communication networks for autonomous mobile robot computer architectures and distributed real-time computing p 3680 N94-32310
Massively parallel systems design for real-time embedded applications
[AD-A277256] p 3826 N94-32323
Modular Simulator System (MSS). Engineering design guide
[AD-A276967] p 3589 N94-32394
Modular Simulator System (MSS): Interface design document for the generic MSS
[AD-A277270] p 3590 N94-32403
High performance real-time flight simulation at NASA Langley p 3591 N94-32473
Developing a personal-computer-based records retention system using Paradox(tm)
[DE94-007984] p 3819 N94-32749
Selection criteria and facilitation training for the study of groupware
[NASA-CR-195906] p 3822 N94-33114

COMPUTER SYSTEMS PERFORMANCE

Sandia's research network for Supercomputing 1993: A demonstration of advanced technologies for building high-performance networks
[DE94-005319] p 3823 N94-31149
Performability modelling using DyQNtool+
[MEMO-INF-93-45] p 3812 N94-31659
Using atomic actions in replica groups to simplify the replication implementation
[REPT-93-78] p 3813 N94-31695
Compiler techniques for managing data motion
[AD-A276514] p 3918 N94-31930
The use of service limits for efficient operation of multi-station single-medium communication systems
[CWI-BS-R9312] p 3677 N94-32085

COMPUTER SYSTEMS PROGRAMS

The development and use of an evaluation mechanism for the assessment of software configuration management tools
[AD-A275961] p 3810 N94-31383

COMPUTER SYSTEMS SIMULATION

Proof of concept for the rewrite rule machine: Interensemble studies
[AD-A276506] p 3809 N94-31263

COMPUTER TECHNIQUES

Discovery systems for manufacturing
[AD-A276216] p 3828 N94-31061
Symbolic derivation of Runge-Kutta methods
[MATHS-REPT-A-205] p 3840 N94-31160
An analysis of the records management process to determine the impact of automation on productivity
[AD-A275923] p 3916 N94-31344
An active computer supported medium for distributed planning in enterprises
[ETN-94-95738] p 3829 N94-31372
Possible improvements of satellite ephemeris programs used in geodesy
[PB94-148681] p 3743 N94-31592
Designing in virtual reality: Modelling Objects in a Virtual Environment (MOVE)
[REPT-93-91] p 3813 N94-31704
On-line physical parameter identification and adaptive control of a launch vehicle p 3602 N94-31891
Beyond the read-eval loop: The artifacts system
[AD-A276589] p 3803 N94-32034
Performance metrics for low probability of intercept-communication system
[AD-A277346] p 3677 N94-32073
Transformational derivation of (parallel) programs using skeletons
[TR-93-20] p 3825 N94-32196
MULTIGRAPH: An architecture for model-based programming. Model-based program synthesis for parallel computing. PREMOS: Programming environment for model-based program synthesis, version 01.00.00
[AD-A276949] p 3817 N94-32219
Multiple inheritance via intersection types
[TR-93-18] p 3848 N94-32292
New approaches for real time decision support systems p 3915 N94-32426
Institute for Computational Mechanics in Propulsion (ICOMP)
[NASA-TM-106542] p 3710 N94-32969
An evaluation framework for designing a night vision, computer-based trainer
[AD-A278005] p 3590 N94-33139
Cumulative reports and publications through December 31, 1993
[NASA-CR-194889] p 3806 N94-33286

COMPUTER VIRUSES

The FELICIA bulletin board system and the IRBIS anonymous FTP server: Computer security information sources for the DOE community
[DE94-008219] p 3825 N94-31920

COMPUTER VISION

Computing the precision of localization in a plane using projective invariants
[TELECOM-93-D-005] p 3840 N94-31095
Camera-space manipulation with natural visual information p 3829 N94-31207
Digit-Eyes: Vision-based human hand tracking
[NASA-CR-195913] p 3803 N94-31447
Polyhedric object recognition by indexing in a model base
[ETN-94-95913] p 3812 N94-31542
CAD-based off-line planning for an active-vision system
[ISBN-0-315-86317-X] p 3813 N94-31713
Volumetric modelling of three dimensional scenes by octree decomposition of geometric models
[ISBN-0-315-86866-X] p 3814 N94-31728
Real-time control of the Trussarm variable-geometry-truss manipulator utilizing machine vision
[ISBN-0-315-87054-0] p 3830 N94-31735
A neural network model for the visual perception of the depth of a scene from stereoscopy and shading
[ISBN-0-315-86753-1] p 3831 N94-31750
Synchronized laser scanning three dimensional acquisition system
[ISBN-0-315-86848-1] p 3879 N94-31756
Strategy for tracking and grabbing a moving object with the aid of a decouplable manipulator with six degrees of freedom general architecture, guided by a vision system
[ISBN-0-315-86864-3] p 3831 N94-31757
Safe navigation and active vision for autonomous vehicles: A purposive and direct solution
p 3832 N94-31842
Robot motion vision by fixation p 3833 N94-31991
Visual evaluation of computer-generated textures
[AD-A277201] p 3816 N94-32093
Neural models of spatial orientation in novel environments
[AD-A277383] p 3835 N94-32340

COMPUTERIZED SIMULATION

Model of spacecraft atomic oxygen and solar exposure microenvironments p 3593 N94-31021
Evaluation of HardSys/HardDraw, an expert system for electromagnetic interactions modelling
[AD-A276218] p 3670 N94-31063
Modelling the late part of room impulse responses using adaptive filtering: On the recreation of reality
[CTH-E-93-01] p 3859 N94-31076
Scattering of a random acoustic field by an infinite cylinder: Application to the modelization of the acoustic environment of the 'Ariane 5' launcher scale-model using experimental data
[ONERA-NT-1993-11] p 3860 N94-31226
Molecular dynamics computer simulations of charged metal electrode-aqueous electrolyte interfaces
[AD-A276401] p 3863 N94-31237
ADCIRC: An advanced three-dimensional circulation model for shelves, coasts, and estuaries. User's manual for ADCIRC-2DDI
[AD-A276150] p 3787 N94-31250
Description of a package for the analysis and display of the results of numerical simulations
[AD-A276285] p 3841 N94-31252
Hydrogenated amorphous silicon (a-Si:H) based gamma camera: Monte Carlo simulations
[DE94-007042] p 3795 N94-31323
Developing the Multimedia User Interface Component (MUSIC) for the Icarus Presentation System (IPS)
[AD-A276341] p 3810 N94-31335
Using Monte Carlo techniques and parallel processing for debris hazard analysis of rocket systems
[DE94-007250] p 3609 N94-31382
The threshold energy for defect production in SiC: A molecular dynamic study
[DE94-007123] p 3896 N94-31499
Delft Ising computing engine
[PB94-148251] p 3806 N94-31567
Virtual annotation: Verbal communication in virtual reality
[REPT-93-67] p 3674 N94-31645
The influence of the deorbit-burn manoeuvre on the footprint of a re-entry capsule
[LR-727] p 3609 N94-31705
Model-based scientific discovery: A study in space bioengineering p 3799 N94-31990
Computer modelling of cyclic deformation of high-temperature materials
[AD-A277056] p 3623 N94-32012
On an adaptation method for dense, 2D, C-type grids
[W-9321] p 3706 N94-32045
Selection of climate station data using clustering and triangulated irregular network techniques
[AD-A276658] p 3784 N94-32046

The Second International Workshop on Discrete Time Domain Modelling of Electromagnetic Fields and Networks. Program and information
[AD-A277136] p 3677 N94-32067
Atmospheric structure simulation: An autoregressive model for smooth geophysical power spectra with known autocorrelation function
[AD-A276691] p 3773 N94-32118
Using TSAR with the post-processing far-field option
[DE94-006615] p 3679 N94-32188
Proceedings of the International Workshop on Computational Electronics
[AD-A277020] p 3692 N94-32259
Validation support of the ERIM ocean model
[AD-A277364] p 3788 N94-32284
Parallel Monte Carlo reactor neutronics
[DE94-007642] p 3826 N94-32357
Parallel particle simulations of low-density fluid flows
[DE94-007858] p 3707 N94-32373
High-resolution numerical methods for compressible multi-phase flow in hierarchical porous media
[DE94-008261] p 3707 N94-32410
Assembly flow simulation of a radar
p 3823 N94-32431
Literacity: A multimedia adult literacy package combining NASA technology, recursive ID theory, and authentic instruction theory p 3924 N94-32462
Technology transfer of operator-in-the-loop simulation
p 3802 N94-32472
High performance real-time flight simulation at NASA Langley p 3591 N94-32473
Construction of a parallel processor for simulating manipulators and other mechanical systems
[NASA-CR-191327] p 3826 N94-32482
VME rollback hardware for time warp multiprocessor systems
[NASA-CR-191796] p 3826 N94-32483
Molecular Science Research Center
[DE94-007464] p 3871 N94-32605
Complete model description of an electron beam using ACCEPT Monte Carlo simulation code
[DE94-007063] p 3872 N94-32628
Automatic contact in DYNA3D for vehicle crashworthiness
[DE94-007143] p 3738 N94-32637
Molecular interactions in dilute supercritical mixtures: Molecular dynamics investigation
[DE94-007610] p 3872 N94-32644
Particle-in-Cell (PIC) code simulation results and comparison with theory scaling laws for photoelectron-generated radiation
[DE94-006132] p 3695 N94-32662
Development of a computer model for polycrystalline thin-film CuInSe2 and CdTe solar cells
[DE94-006853] p 3762 N94-32763
The Numerical Tokamak Project (NTP) simulation of turbulent transport in the core plasma: A grand challenge in plasma physics
[DE94-008279] p 3892 N94-32838
Fluid Dynamics Lagrangian Simulation Model
[AD-A277438] p 3710 N94-33009
Implementation of a vibrationally linked chemical reaction model for DSMC
[NASA-TM-109109] p 3710 N94-33020
Simultaneous excitation of parametric decay cascades and the OTSI in 1D numerical simulations based on Aakarov's equations
[AD-A278108] p 3893 N94-33042
Design and Monte Carlo analysis of an unmanned aerial vehicle
[AD-A277648] p 3560 N94-33056
Visual perception of 3-dimensional structure from different types of optical deformation
[AD-A278272] p 3884 N94-33141
Computational methods in continuum mechanics
[AD-A278144] p 3859 N94-33161
How well was total ozone abundance inferred with Mariner 9 p 3947 N94-33212
Snowmelt forecasting. Further cold regions development of operational hydrological forecasting, volume 2
[AD-A278123] p 3757 N94-33269
Simulation of CO2 release at 800 km altitude
[AD-A276692] p 3776 N94-33272

COMPUTERS
Standardization and intellectual property control: A reflection on the informatics case
[TELECOM-93-E-016] p 3915 N94-31172
Pen-based computers: Computers without keys
p 3808 N94-32434

CONCATENATED CODES
Spread-spectrum radio systems and networks
[AD-A276449] p 3671 N94-31260

CONCRETE STRUCTURES
Dual-band infrared imaging to detect corrosion damage within airframes and concrete structures
[DE94-006047] p 3580 N94-32658

CONCRETES
Nonlocal theory for fracturing of quasibrittle materials
[AD-A278283] p 3740 N94-33143

CONCURRENT PROCESSING
Proof of concept for the rewrite rule machine: Interensemble studies
[AD-A276506] p 3809 N94-31263
Design Methods based On Nets: DEMON
[PB94-147493] p 3813 N94-31687

CONDENSATES
Minimax: Multiparticle physics at the Tevatron collider
[DE94-007095] p 3873 N94-32689

CONDENSATION NUCLEI
Counting particles emitted by stratospheric aircraft and measuring size of particles emitted by stratospheric aircraft
[NASA-CR-195908] p 3769 N94-33170

CONDENSED MATTER PHYSICS
International Journal of Quantum Chemistry. Quantum Biology Symposium number 20. Proceedings of the International Symposium on the Application of Fundamental Theory to Problems of Biology and Pharmacology
[AD-A276294] p 3792 N94-31294
Summary of the 1993 Winter ACP Workshop on Collective Dynamics in Disordered System
[AD-A276355] p 3864 N94-31402

CONDITIONED REFLEXES
Stress-induced enhancement of the startle reflex
[AD-A278414] p 3802 N94-33327

CONDITIONING (LEARNING)
Stress-induced enhancement of the startle reflex
[AD-A278414] p 3802 N94-33327

CONDUCTING FLUIDS
Stability and instability criteria for magnetohydrodynamics
[PB94-148475] p 3889 N94-31772

CONDUCTING POLYMERS
The Sixth Symposium on Unconventional Photoactive Solids. Abstracts
[AD-A277198] p 3655 N94-32016
Polymer electrolyte fuel cells
[DE94-007558] p 3761 N94-32762
Novel sol-gel deposition for repair of conducting paths in polyceramic systems
[AD-A278381] p 3864 N94-33350

CONDUCTION BANDS
Experimental and theoretical studies of hydrogenated amorphous semiconductor alloys and superlattices
[AD-A276159] p 3686 N94-31079

CONDUCTION ELECTRONS
X ray pulse considerations and electron flow in high voltage diodes
[AD-A277301] p 3868 N94-32044

CONDUCTIVE HEAT TRANSFER
Space Station WP-2 application of LDEF MLI results
p 3592 N94-31016
THERM3D: A boundary element computer program for transient heat conduction problems
[DE94-008112] p 3708 N94-32709
Numerical model of the thermal behavior of an extremity in a cold environment including counter-current heat exchange between the blood vessels
[AD-A278099] p 3798 N94-33040
Computational methods in continuum mechanics
[AD-A278144] p 3859 N94-33161

CONDUCTIVITY
Novel electroactive polymers and block copolymers
[AD-A276119] p 3650 N94-31509

CONDUCTIVITY METERS
Perspectives of glucose sensing based on a charge-modulating competition reaction
[ISBN-9-09-005754-4] p 3795 N94-31652

CONDUCTORS
A simple model for determining photoelectron-generated radiation scaling laws
[DE94-006130] p 3761 N94-32660
An electrical test system for conductor formation process analysis
[DE94-007291] p 3696 N94-32786
Grounding ring for ground adapters
[AD-D016118] p 3697 N94-32962

CONFERENCES
LDEF Materials Results for Spacecraft Applications
[NASA-CP-3257] p 3591 N94-31012
Workshop on Physics of Accretion Disks Around Compact and Young Stars
[NASA-CR-195756] p 3927 N94-31116
The 1988 Goddard Space Flight Center Battery Workshop
[NASA-CP-3237] p 3758 N94-31233
Proceedings of the 37th international symposium on electron, ion, and photon beams
[AD-A276478] p 3875 N94-31247
Physical chemistry of molecules and grains in space
[AD-A276037] p 3932 N94-31280
The 18th annual electronics manufacturing seminar
[AD-A276038] p 3687 N94-31281
International Journal of Quantum Chemistry. Quantum Biology Symposium number 20. Proceedings of the International Symposium on the Application of Fundamental Theory to Problems of Biology and Pharmacology
[AD-A276294] p 3792 N94-31294
Workshop on advances in smooth particle hydrodynamics
[DE94-006221] p 3956 N94-31308
First theory institute on computational differentiation
[DE94-006491] p 3841 N94-31309
Proceedings of the 4th Tunnel Detection Symposium on Subsurface Exploration Technology
[AD-A276372] p 3771 N94-31369
The Second Annual International Space University Alumni Conference
[NASA-CP-3253] p 3598 N94-31425
Minutes: Accredited Standards Committee on Bioacoustics, S3. US TAG for ISO/TC 43, acoustics, IEC/TC 29 electroacoustics, and ISO/TC 108/SC4 human exposure to mechanical vibration and shock
[AD-A276201] p 3795 N94-31490
Proceedings of a Joint US-Japan Seminar in the Environmental Sciences
[DE94-004727] p 3741 N94-31606
Proceedings of the Seventeenth DOE Solar Photochemistry Research Conference
[DE94-005552] p 3759 N94-31648
Double photoionization of helium with synchrotron x rays: Proceedings
[DE94-006737] p 3866 N94-31668
Proceedings of the DCIEM Diver Thermal Protection Workshop
[DCIEM-92-10] p 3795 N94-31738
Current Research Information in Europe: Conference proceedings
[PB94-127933] p 3917 N94-31768
Proceedings of the International Workshop on Artificial Intelligence Applications in Solar-Terrestrial Physics
[PB94-142064] p 3832 N94-31808
Aerospace software engineering for advanced systems architectures
[AD-A277101] p 3581 N94-31977
The Sixth Symposium on Unconventional Photoactive Solids. Abstracts
[AD-A277198] p 3655 N94-32016
Proceedings of the 1993 Antenna Applications Symposium, volume 1
[AD-A277202] p 3676 N94-32049
Proceedings of the 1993 Antenna Applications Symposium, volume 2
[AD-A277203] p 3677 N94-32050
The Second International Workshop on Discrete Time Domain Modelling of Electromagnetic Fields and Networks. Program and information
[AD-A277136] p 3677 N94-32067
The 10th International Conference on Internal Friction and Ultrasonic Attenuation in Solids (ICIFUAS)
[AD-A276849] p 3902 N94-32209
The 14th Annual West Coast Theoretical Chemistry/Statistical Mechanics Conference
[AD-A276942] p 3656 N94-32239
Workshop on Commercialization of Pulsed Power Science and Technology Proceedings
[AD-A276987] p 3692 N94-32258
Proceedings of the International Workshop on Computational Electronics
[AD-A277020] p 3692 N94-32259
WOCSDICE 1993 --- 17th European Workshop on Compound Semiconductor Devices and Integrated Circuits
[AD-A276766] p 3693 N94-32307
Technology 2003: The Fourth National Technology Transfer Conference and Exposition, volume 2
[NASA-CP-3249] p 3956 N94-32420
Proceedings of the Ad Hoc Workshop on Ceramics for Li/FeS2 batteries
[DE94-007460] p 3694 N94-32607
Proceedings of the Ninth Annual Pacific Climate (PACLIM) Workshop
[DE94-003024] p 3766 N94-32693
Interagency Advanced Power Group: Steering Group meeting minutes
[DE94-007951] p 3761 N94-32701
Flywheel Energy Storage Technology Workshop
[DE94-008064] p 3761 N94-32705
Proceedings of the Workshop on B Physics at Hadron Accelerators
[DE94-007961] p 3877 N94-32748
Proceedings of the International Workshop on Low Energy Muon Science: LEMS 1993
[DE94-006495] p 3874 N94-32804

The 1994 International Sherwood Fusion Theory Conference
[DE94-008961] p 3877 N94-32844
The 6th International Conference on Modulated Semiconductor Structures
[AD-A276815] p 3906 N94-32908
Proceedings, Strongly Correlated Electronic Materials: The 1993 Los Alamos Symposium
[DE94-009293] p 3906 N94-32913
Silicon-Based Optoelectronic Materials Symposium and Materials Research Society Proceedings, volume 298
[AD-A277518] p 3662 N94-32952
International Free Electron Laser Conference
[AD-A277576] p 3721 N94-33000
Proceedings of the NIPS 1993 Postconference Workshop on Pulling It All Together: Methods for Combining Neural Networks
[AD-A277507] p 3836 N94-33014
CRAD Signal and Information Processing Working Group Workshop on Neural networks, volume 1
[DREA-TC-93-305-VOL-1] p 3836 N94-33149
Cockpit Electronic Display Workshop: Proceedings (computer diskette)
[AD-M000330] p 3805 N94-33171
Conference on operator, wavelet and control theory
[AD-A277429] p 3838 N94-33174
The Northern Plains MSATT Meeting, and a call for a field-oriented successor to MSATT
p 3947 N94-33210
From animals to animats
[AD-A277427] p 3802 N94-33241
Cockpit Electronic Display Workshop: A synopsis
[AD-A277728] p 3583 N94-33280
The 28th Aerospace Mechanisms Symposium
[NASA-CP-3260] p 3603 N94-33291
Proceedings of the Symposium/Workshop on Applications of Expert Systems in DND
[DSIS-93-00343] p 3853 N94-33335

CONFIGURATION MANAGEMENT
The development and use of an evaluation mechanism for the assessment of software configuration management tools
[AD-A275961] p 3810 N94-31383
A model and algorithms for a software evolution control system
[AD-A276431] p 3811 N94-31449
Beyond the read-eval loop: The artifacts system
[AD-A276589] p 3803 N94-32034

CONFINEMENT
Toroidal pinch experiments
[DE94-005876] p 3887 N94-31558
Cooling and trapping of neutral atoms
[AD-A276957] p 3870 N94-32360
New polymer target-shell properties and characterizations
[DE94-008420] p 3890 N94-32415
Divertor pumping and other reactor application issues for H-mode
[DE94-007431] p 3892 N94-32810

CONFORMAL MAPPING
Sound scattering by cylinders of noncircular cross section
[AD-A276663] p 3861 N94-32089

CONGRESSIONAL REPORTS
Global change research and NASA's Earth Observing System
[PB94-126992] p 3741 N94-31068

CONICAL SCANNING
Radar rainfall measurements from space
p 3782 N94-31889

CONIFERS
Research and applications of a canopy reflectance model p 3747 N94-32492
Effects of long-term elevated atmospheric CO2 concentrations on Pinus ponderosa
[DE94-008832] p 3769 N94-32966

CONJUGATE GRADIENT METHOD
Design and analysis of scalable parallel algorithms
[AD-A276255] p 3809 N94-31251
Lattice geometrodynamics p 3857 N94-31825
Variational elliptic solver for atmospheric applications
[DE94-007725] p 3774 N94-32647

CONJUGATION
Conjugated polymer fluorescence: Interplay of correlations and alternation
[DE94-005587] p 3660 N94-32729

CONNECTORS
Nd-YAG laser welding of the fiber optic connector to the header shell on the 2SL actuator
[DE94-006104] p 3723 N94-31621
New thick film feedthrough configurations
[DE94-008706] p 3694 N94-32582

CONSERVATION EQUATIONS
Can a variable alpha induce limit cycle behavior and exponential luminosity decay in transient soft x ray sources? p 3929 N94-31129

CONSERVATION LAWS
Fully discrete arbitrary-order schemes for a model hyperbolic conservation law
[CRANFIELD-AERO-9307] p 3843 N94-31539
Multidimensional WAF-type schemes for model conservation laws
[CRANFIELD-AERO-9312] p 3843 N94-31541
A numerical method for mixing/chemically reacting compressible flow with finite rate chemistry
p 3634 N94-31824
A polling system with a dormant server
[CWI-BS-R9313] p 3835 N94-32193

CONSISTENCY
High-performance speech recognition using consistency modeling
[AD-A276775] p 3679 N94-32185

CONSOLIDATION
Empirical optimization of the consolidation of thermoplastic prepregs
[ISBN-0-315-86455-9] p 3652 N94-31722
Effect of surface forces on the rheology of particle-liquid systems and the consolidation of ceramic powders
[AD-A277092] p 3657 N94-32391

CONSTANTS
Experimental studies on the effect of coherency strains on coarsening kinetics: Current status and future outlook
[DE94-008480] p 3647 N94-32964

CONSTRAINTS
A Gauss-Seidel type solver for special convex programs, with application to frictional contact mechanics
[REPT-93-77] p 3813 N94-31694
Space Station Freedom solar array containment box mechanisms p 3603 N94-33292

CONSUMERS
Strategies for survival in the new environmental era
[AD-A276827] p 3785 N94-32195

CONTACT LOADS
Point-contact and point-impact dynamics for multibody chains
[ISBN-0-315-87056-7] p 3734 N94-31737
Development of a robotic simulator for studying interference and contact problems
[ISBN-0-315-86705-1] p 3588 N94-31747
Application of contact mechanics for the validation of robotized operations of grasping objects subjected to static and dynamic force fields
[ISBN-0-315-86831-7] p 3725 N94-31754
Automatic analysis of force distribution in multi-fingered articulated hands
[ISBN-0-315-87205-5] p 3725 N94-31878
Computational methods for frictional contact with applications to the Space Shuttle orbiter nose-gear tire
p 3608 N94-32295
New micro- and macroscopic models of contact and friction
[AD-A277240] p 3726 N94-32320
A procedure for 3-D contact stress analysis of spiral bevel gears
[NASA-CR-194472] p 3728 N94-32929

CONTACT RESISTANCE
Electromagnetic scattering through loaded aperture panels with nonzero contact impedance
[ONERA-NT-1993-2] p 3673 N94-31418

CONTAINERS
A compatibility study of FEFO with various containment materials
[DE94-005753] p 3649 N94-31198

CONTAMINANTS
An overview of the on-orbit contamination of the Long Duration Exposure Facility (LDEF) p 3598 N94-31049
Photothermal laser deflection, an innovative technique to measure particles in exhausts
[AD-A277151] p 3718 N94-32366

CONTAMINATION
Anodized aluminum on LDEF p 3592 N94-31017
Modeling of LDEF contamination environment
p 3592 N94-31019
Degradation of optical components in space
p 3594 N94-31029
Atmosphere quality standards in manned space vehicles
[ESA-PSS-03-401-ISSUE-1] p 3802 N94-31224
Information systems to enhance technology exchange
[DE94-007744] p 3920 N94-32808
Focused feasibility study final field sampling plan
[AD-A277445] p 3769 N94-33105

CONTEXT
The interpretation of free focus
[CL-93-01] p 3855 N94-31390

CONTEXT FREE LANGUAGES
Informal introduction to the extended affix grammar formalism and its compiler
[TR-93-19] p 3817 N94-32287

CONTINENTAL SHELVES
Gas hydrate detection and mapping on the US east coast
[DE94-005959] p 3742 N94-31504
Deep water studies of CTD data
[AD-A277741] p 3791 N94-33176
Fluid mechanical measurements within the bottom boundary layer over the Northern California continental shelf during stress
[AD-A277916] p 3791 N94-33243

CONTINUOUS RADIATION
Development of a frequency-domain electromagnetic scattering measurement system
[AD-A276738] p 3678 N94-32179

CONTINUOUS WAVE LASERS
Near resonant absorption by atoms in intense fluctuating laser fields
[DE94-005873] p 3714 N94-31200
High-power CW diode-laser-array-pumped solid-state lasers and efficient nonlinear optical frequency conversion
[AD-A276126] p 3714 N94-31278
The development and testing of a backscatter absorption gas imaging (BAGI) system designed to image at a range of 300 m
[DE94-006192] p 3675 N94-31761

CONTINUUM MECHANICS
Computational methods in continuum mechanics
[AD-A278144] p 3859 N94-33161

CONTINUUM MODELING
Development of an advanced continuum theory for composite laminates, volume 1
[AD-A277275] p 3625 N94-32591
Development of an advanced continuum theory for composite laminates, volume 2
[AD-A277276] p 3625 N94-32592

CONTINUUMS
Observations of accretion and angular momentum regulation in young circumstellar disks and the implications for planetary formation p 3928 N94-31122
Thermal continua of AGN accretion disks
p 3931 N94-31137

CONTOURS
Steepest descent paths for integrals defining the modified Bessel functions of imaginary order
[CWI-AM-R9303] p 3848 N94-32227
Surface conforming flexible eddy current probe for scanning varying surface contours
[AD-D016173] p 3627 N94-33018

CONTRACT MANAGEMENT
Management of government quality assurance functions for NASA contracts
[NHB-5300.4(2B-2)] p 3731 N94-32387

CONTRACTORS
Common modeling system for digital simulation
p 3823 N94-32429

CONTROL BOARDS
Optimal planning of residential photovoltaic systems under various rate structure
[DE94-757272] p 3762 N94-32919

CONTROL EQUIPMENT
International Space Station Alpha's bearing, motor, and roll ring module developmental testing and results
p 3603 N94-33295

CONTROL MOMENT GYROSCOPES
Adaptive nonlinear control of spacecraft
p 3609 N94-31564

CONTROL SIMULATION
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-flight controls module, volume 3
[AD-A276970] p 3590 N94-32395
Plan recognition for an air traffic control simulation
[DSIS-94-01221] p 3577 N94-32505

CONTROL STABILITY
Feasibility and stability results for constrained stable generalized predictive control
[MATHS-REPT-A-203] p 3828 N94-31158
Robot grasping: Stability and optimization issues
p 3724 N94-31724
Automatic analysis of force distribution in multi-fingered articulated hands
[ISBN-0-315-87205-5] p 3725 N94-31878
Antiwindup analysis and design approaches for MIMO systems
[NASA-CR-195304] p 3584 N94-32075
Control strategies for systems with limited actuators
[NASA-CR-195307] p 3727 N94-32741

CONTROL SURFACES
Active control for fin buffet alleviation
[AD-A276844] p 3586 N94-32224
Combined contamination and space environmental effects on solar cells and thermal control surfaces
[NASA-TM-106592] p 3617 N94-33022

CONTROL SYSTEMS DESIGN
A direct digital design for a multichannel structural test system using the characteristic locus method
[MATHS-REPT-A-206] p 3828 N94-31161
AGARD highlights 94/1, April 1994
[AGARD-HIGHLIGHTS-94/1] p 3956 N94-31196
Control of hypersonic aerodynamic forces with surface blowing p 3567 N94-31216
Control of a flexible space robot tracking a moving target p 3722 N94-31469
ControlShell: A real-time software framework
[AD-A276481] p 3811 N94-31475
A neural network methodology for engineering applications: The learning control of robotic systems
[RR-480] p 3830 N94-31500
Real time simulation model for designing converter regulation
[ETN-94-95735] p 3689 N94-31576
Digital state-feedback H(infinity) control of Pritchard-Salamon systems: A Popov function approach
[REPT-93-69] p 3830 N94-31647
A Hyland-Bernstein approach to the digital control of Pritchard-Salamon systems
[REPT-93-76] p 3844 N94-31693
Development of a feedforward controller for a flexible manipulator
[ISBN-0-315-86515-6] p 3832 N94-31801
A real-time computer control and trajectory generation environment for Trussarm
[ISBN-0-315-87060-5] p 3832 N94-31833
Development of a reconfigurable helicopter flight control system
[ISBN-0-315-87218-7] p 3585 N94-31837
Real-time control and application to robotics: Hardware and software architectures
[ISBN-0-315-87192-X] p 3833 N94-31876
On-line physical parameter identification and adaptive control of a launch vehicle p 3602 N94-31891
High-speed path constrained manipulator operation using optimal-feedback combined controller p 3833 N94-31962
Control of a flexible-link robotic arm manipulating an unknown dynamic payload p 3725 N94-31973
Adaptive control of telerobotic systems worn by humans
[AD-A276608] p 3834 N94-32036
Antiwindup analysis and design approaches for MIMO systems
[NASA-CR-195304] p 3584 N94-32075
Novel failure analysis techniques using photon probing with a scanning optical microscope
[DE94-006594] p 3692 N94-32112
Approximation theory and computational methods for the identification and control of distributed parameter systems
[AD-A277335] p 3848 N94-32244
Control strategies for systems with limited actuators
[NASA-CR-195307] p 3727 N94-32741
Active vortex control for a high performance wing
[AD-D016140] p 3573 N94-32974
Parametric robust control and system identification: Unified approach
[NASA-CR-195826] p 3836 N94-32980
Implementing software safety in the NASA environment
[NASA-TM-106597] p 3731 N94-33032
Investigation of drive-reinforcement learning and application of learning to flight control
[AD-A277442] p 3801 N94-33053
Pointing and tracking space mechanism for laser communication p 3606 N94-33310

CONTROL THEORY
Feasibility and stability results for constrained stable generalized predictive control
[MATHS-REPT-A-203] p 3828 N94-31158
Observations of the notion of minimality in the generalized state space
[MATHS-REPT-A-207] p 3840 N94-31162
Vibration control and design of composite cantilevers taking into account structural uncertainties and damage p 3733 N94-31213
A neural network methodology for engineering applications: The learning control of robotic systems
[RR-480] p 3830 N94-31500
Adaptive nonlinear control of spacecraft p 3609 N94-31564
A Hyland-Bernstein approach to the digital control of Pritchard-Salamon systems
[REPT-93-76] p 3844 N94-31693
On the convergence of stochastic iterative dynamic programming
[AD-A276517] p 3815 N94-31933
Modeling and control of nonlinear systems
[AD-A277377] p 3834 N94-32095
Control of a random walk with noisy delayed information
[CWI-BS-R9316] p 3846 N94-32108
Control experiments in liquid metal combustion
[AD-A276918] p 3635 N94-32234
Approximation theory and computational methods for the identification and control of distributed parameter systems
[AD-A277335] p 3848 N94-32244
Stochastic realization of a Gaussian stochastic control system
[CWI-BS-R9320] p 3852 N94-32350
Study of dynamic stall phenomenon and its control using vorticity, stream function and circulation form of the unsteady Navier-Stokes equations p 3572 N94-32714
Control strategies for systems with limited actuators
[NASA-CR-195307] p 3727 N94-32741
Parametric robust control and system identification: Unified approach
[NASA-CR-195826] p 3836 N94-32980
Investigation of drive-reinforcement learning and application of learning to flight control
[AD-A277442] p 3801 N94-33053
Conference on operator, wavelet and control theory
[AD-A277429] p 3838 N94-33174
Adaptive control of nonlinear and stochastic systems
[AD-A278411] p 3839 N94-33325

CONTROL VALVES
Design of a two dimensional planer pressurized air labyrinth seal test rig
[AD-A277232] p 3726 N94-32370

CONTROLLED ATMOSPHERES
Atmosphere quality standards in manned space vehicles
[ESA-PSS-03-401-ISSUE-1] p 3802 N94-31224

CONTROLLED FUSION
Anomalous thermalization of fast ions in magnetized plasma
[DE94-007109] p 3891 N94-32631
The 1994 International Sherwood Fusion Theory Conference
[DE94-008961] p 3877 N94-32844

CONTROLLERS
Taming chaotic circuits p 3910 N94-31289
An analysis of instruction-cached SIMD computer architecture
[AD-A276519] p 3806 N94-31934
High-speed path constrained manipulator operation using optimal-feedback combined controller p 3833 N94-31962
Control of a flexible-link robotic arm manipulating an unknown dynamic payload p 3725 N94-31973
Antiwindup analysis and design approaches for MIMO systems
[NASA-CR-195304] p 3584 N94-32075
Geometric structure of the adaptive controller of the human arm
[AD-A276797] p 3834 N94-32152
Refining fuzzy logic controllers with machine learning p 3839 N94-32421
A fuzzy classifier system for process control p 3839 N94-32422
Fuzzy-neural control of an aircraft tracking camera platform p 3839 N94-32423
Feed-forward control of gear mesh vibration using piezoelectric actuators
[NASA-TM-106366] p 3728 N94-32902
State-space self-tuner for on-line adaptive control
[NASA-CR-195836] p 3835 N94-32943
Operational experience and evaluation of a dual-element stretched-membrane heliostat
[DE94-008827] p 3763 N94-32965
Intelligent control of a multi-degree-of freedom reaction compensating platform system using fuzzy logic p 3605 N94-33306

CONVECTION
Convection and electrodynamic signatures in the vicinity of a Sun-aligned arc: Results from the Polar Acceleration Regions and Convection Study (Polar ARCS) p 3954 N94-31102
Convective solar nebula p 3930 N94-31130
Rotational effects in turbulence driven by convection p 3930 N94-31131
Compressible convection with ionization p 3911 N94-31498
Regional sources of error growth in the National Meteorological Center's medium-range forecast model p 3781 N94-31554
Surface fluxes of trace gases derived from convective-layer profiles p 3704 N94-31774
Thermocapillary convection in evaporating sessile drops
[NASA-TM-109758] p 3705 N94-31886
Cumulus convection parameterization and numerical modelling of moist atmospheres p 3783 N94-31989
A model of the ion chemistry of electrified convection p 3868 N94-31993
Convection in Type 2 supernovae
[DE94-009373] p 3938 N94-32914
Operations summary for the convection and moisture experiment (CAMEX)
[NASA-TM-108445] p 3786 N94-33004
Characteristics of ion flow in the quiet state of the inner plasma sheet
[AD-A277451] p 3894 N94-33106

CONVECTION CURRENTS
Tropical squall lines p 3778 N94-30992

CONVECTION-DIFFUSION EQUATION
Viscous limiter functions for model convection-diffusion equations
[CRANFIELD-AERO-9103] p 3702 N94-31559
A stability estimate based on numerical ranges with application to a spectral discretization of a convection-diffusion equation
[TW-93-12] p 3847 N94-32200

CONVECTIVE FLOW
Effects of the deep tropical convection in the large scale atmospheric flow p 3778 N94-30994
Compressible convection with ionization p 3911 N94-31498
Steady thermal convection in multiple liquid layers p 3705 N94-31844

CONVECTIVE HEAT TRANSFER
Origin and thermal evolution of Mars p 3940 N94-31109
A tectonic resurfacing model for Venus p 3941 N94-31113
The resurfacing controversy for Venus: An overview and a mechanistic perspective p 3941 N94-31114
Plains tectonism on Venus: The deformation belts of Lavinia Planitia p 3941 N94-31115
Development of a three-dimensional icing model for predicting ice accretion on aircraft
[ONERA-NT-1993-5] p 3574 N94-31230
Thermocapillary convection in evaporating sessile drops
[NASA-TM-109758] p 3705 N94-31886
Heat transfer studies on a rectangular channel with offset plate fins
[AD-A277300] p 3912 N94-32043
Computational modeling of convective heat transfer to liquid hydrogen coolant p 3707 N94-32485

CONVENTIONS
Current policies of the major countries coping with the global warming problem and-the energy demand and supply
[DE94-757291] p 3769 N94-32920

CONVERGENCE
The generalized multi delay adaptive filter: Structure and convergence analysis
[TELECOM-93-D-004] p 3808 N94-31094
Stirling's formula and approximations for n(factorial) and the middle ratio
[REPT-93-73] p 3843 N94-31642
Solution of the average-passage equations for the incompressible flow through multiple-blade-row turbomachinery
[AD-A276515] p 3583 N94-31931
On the convergence of stochastic iterative dynamic programming
[AD-A276517] p 3815 N94-31933
On the relationship between generalization error, hypothesis complexity, and sample complexity for radial basis functions
[AD-A276802] p 3851 N94-32142
Numerical transport theory
[DE94-009064] p 3857 N94-32589
Measurement of ICF fuel ion temperature on Nova
[DE94-006150] p 3892 N94-32730
Convergence results for the EM approach to mixtures of experts architectures
[AD-A276801] p 3852 N94-33276

CONVERGENT-DIVERGENT NOZZLES
Simulation of low-density nozzle plumes in non-zero ambient pressures
[NASA-TM-106501] p 3615 N94-32742

CONVEXITY
A Gauss-Seidel type solver for special convex programs, with application to frictional contact mechanics
[REPT-93-77] p 3813 N94-31694

COOLANTS
Computational modeling of convective heat transfer to liquid hydrogen coolant p 3707 N94-32485

COOLERS
The 4 K Stirling cryocooler demonstration
[NASA-CR-191792] p 3669 N94-32484

COOLING
Heat transfer studies on a rectangular channel with offset plate fins
[AD-A277300] p 3912 N94-32043

Cooling and trapping of neutral atoms
[AD-A276957] p 3870 N94-32360
Characterization of thermally stable dye-doped polyimide based electrooptic materials
[DE94-005309] p 3882 N94-32674

COOLING FLOWS (ASTROPHYSICS)
Accretion disks around black holes
p 3928 N94-31117
Structure and stability of spherical accretion flows onto compact objects p 3935 N94-31946

COOLING SYSTEMS
A review of microclimate cooling systems in the chemical, biological, radiological environment
[AD-A276446] p 3802 N94-31302
Thermocapillary convection in evaporating sessile drops
[NASA-TM-109758] p 3705 N94-31886
The 4 K Stirling cryocooler demonstration
[NASA-CR-191792] p 3669 N94-32484

COORDINATES
Geometric structure of the adaptive controller of the human arm
[AD-A276797] p 3834 N94-32152

COORDINATION
Coordination of mesoscale meteorological research between ASL and European group
[AD-A276730] p 3784 N94-32162

COPOLYMERIZATION
Reactions of electrophilic maleic anhydride and epoxy groups with nucleophilic functionalities such as carboxyl, hydroxyl, and amine groups. Polymer Technology Publication series no. 16
[PB94-135589] p 3648 N94-31069

COPOLYMERS
Viscoelastic fracture characterization of polymeric solids p 3652 N94-31745
Isomeric poly(benzophenone)s: Synthesis of highly crystalline poly (4, 4 foot-benzophenone) and amorphous poly (2, 5-benzophenone), a soluble poly (p-phenylene) derivative
[AD-A277261] p 3655 N94-32017
Microstructure of copolymers containing disperse red 1 and methyl methacrylate
[AD-A277140] p 3660 N94-32722

COPPER
Reliability of multilayer copper/polyimide
[AD-A276228] p 3650 N94-31284
The influence of transmutation, void swelling, and flux/spectra uncertainties on the electrical properties of copper and copper alloys
[DE94-006213] p 3641 N94-31626
Aging effects on the microstructure, surface characteristics and wettability of Cu pretinned with Sn-Pb solders
[DE94-007033] p 3641 N94-31638
Oxidation resistant copper
[AD-D016099] p 3696 N94-32721
Induced adsorption of chloride and bromide by submonolayer amounts of copper underpotentially deposited on Pt(111)
[AD-A278023] p 3648 N94-33182

COPPER ALLOYS
The influence of transmutation, void swelling, and flux/spectra uncertainties on the electrical properties of copper and copper alloys
[DE94-006213] p 3641 N94-31626

COPPER COMPOUNDS
Gettering of metal impurities by cavities in silicon
[DE94-005248] p 3645 N94-32672
Strongly anisotropic s-wave versus d-wave gap in cuprate superconductors: Evidence and theory
[DE94-007579] p 3904 N94-32746
Indentability of conventional and negative Poisson's ratio foams p 3629 N94-33131

COPPER OXIDES
High T(sub c) superconductor tunnel junctions for photon detectors
[DE94-007686] p 3904 N94-32602
Investigation of superconductivity and magnetism in d and f-electron materials
[DE94-008535] p 3907 N94-32933
The path for long range conduction in high J(sub c) TlBa2Ca2Cu3O(8+x) spray-pyrolyzed deposits
[DE94-007211] p 3909 N94-33271

COPPER SELENIDES
Role of polycrystallinity in CdTe and CuInSe2 photovoltaic cells
[DE94-000293] p 3758 N94-31236
Development of a computer model for polycrystalline thin-film CuInSe2 and CdTe solar cells
[DE94-006853] p 3762 N94-32763

CORNEA
High peak power microwaves: A health hazard
[AD-A277168] p 3681 N94-32576
Noninvasive spectroscopic diagnosis of superficial ocular lesions and corneal infections
[DE94-006231] p 3797 N94-32732

CORNERS
Shock impingement near mild hypersonic expansion corners p 3569 N94-31879

CORONAL LOOPS
Theoretical studies of magnetohydrodynamic equilibria and dynamics of a solar coronal loop
p 3953 N94-31792

COROTATION
Disk instability and the spectral evolution of the 1992 outburst of the intermediate polar GK Persei
p 3928 N94-31123

CORRECTION
NOAA-9 Earth Radiation Budget Experiment (ERBE) scanner offsets determination
[NASA-TM-109086] p 3785 N94-32737

CORRELATION
Near resonant absorption by atoms in intense fluctuating laser fields
[DE94-005873] p 3714 N94-31200
Influence of long-range correlations on the spectral functions and response of 48Ca and 90Zr
[ETN-94-96017] p 3865 N94-31537
Correlations between micromagnetic, microstructural and microchemical properties in ultrathin epitaxial magnetic structures
[AD-A277200] p 3901 N94-32092
Conjugated polymer fluorescence: Interplay of correlations and alternation
[DE94-005587] p 3660 N94-32729
Spatial correlation of ionospheric variability
[AD-A278105] p 3776 N94-33041

CORRELATION COEFFICIENTS
Nonlinear model validation using correlation tests
[RR-463] p 3842 N94-31394

CORROSION
Development and characterization of intermediary layers allowing the bond between a metal alloy and a plasma sprayed ceramic
[ECL-91-39] p 3619 N94-31377
Dual-band infrared imaging to detect corrosion damage within airframes and concrete structures
[DE94-006047] p 3580 N94-32658
Characterization of the corrosion resistance of duplex stainless steels using local current density mapping techniques
[DE94-007980] p 3646 N94-32699
Nanoscale structural changes upon electrooxidation of Au(111) as probed by potentiodynamic scanning tunneling microscopy
[AD-A276780] p 3909 N94-33275

CORROSION PREVENTION
Evaluation of corrosion protective organic coatings for steel structures in fresh water
[PB94-138484] p 3649 N94-31072
Method and apparatus for inhibiting the disbonding of a paint from metal surfaces
[AD-D016106] p 3663 N94-32960
Evaluation of the Hughes conversion coating touch-up pen
[AD-A278398] p 3664 N94-33166

CORROSION RESISTANCE
Evaluation of corrosion protective organic coatings for steel structures in fresh water
[PB94-138484] p 3649 N94-31072
Study of type 2 and 3 anodized Al 5052-0 in aqueous DS2 solutions
[AD-A276960] p 3644 N94-32240
Robotic weld overlay coatings for erosion control
[DE94-008004] p 3658 N94-32408
Characterization of the corrosion resistance of duplex stainless steels using local current density mapping techniques
[DE94-007980] p 3646 N94-32699

CORROSION TESTS
Evaluation of corrosion protective organic coatings for steel structures in fresh water
[PB94-138484] p 3649 N94-31072
Study of type 2 and 3 anodized Al 5052-0 in aqueous DS2 solutions
[AD-A276960] p 3644 N94-32240
Characterization of the corrosion resistance of duplex stainless steels using local current density mapping techniques
[DE94-007980] p 3646 N94-32699

CORRUGATED PLATES
Vibrational and acoustic response of ribbed plates
p 3736 N94-31955

COSMIC DUST
Circumstellar material around young stars in Orion
p 3930 N94-31133
CO observations in external galaxies and gas mass determination p 3925 N94-31790

COSMIC GASES
CO observations in external galaxies and gas mass determination p 3925 N94-31790

COSMIC PLASMA
Laboratory and space experiments as a key to the plasma universe
[TRITA-ALP-1993-01] p 3885 N94-31088

COSMIC RAYS
Mitigation of adverse environmental effects on lunar-based astronomical instruments
p 3598 N94-31426
Nuclear physics and astrophysics
[DE94-007168] p 3939 N94-33147

COSMIC X RAYS
Stellar x ray polarimeter polarizer development and calibration at LEA/LLNL
[DE94-006400] p 3712 N94-31783

COSMOLOGY
Gravitational effects of cosmic strings
[ISBN-0-315-75484-2] p 3934 N94-31789

COST ANALYSIS
An analysis of non-integerizing the aircraft engines Cost Effectiveness Analysis Spreadsheet Model (CEAMOD version 2.0)
[AD-A276251] p 3583 N94-31290
Economic feasibility analysis of distributed electric power generation based upon the natural gas fired fuel cell
[DE94-005795] p 3759 N94-31487
Budget allocation and monopolistic pricing in a multiproduct firm
[REPT-93-86] p 3924 N94-31617
Design of a logistics model for building and supporting a lunar station
[ILR-MITT-282(1993)] p 3803 N94-31852
Prospects for the French fighter industry in a post-cold war environment: Is the future more than a mirage?
p 3565 N94-31959
Identification of research relating to the critical loads concept and its potential application to the regulation of acidic deposition
[DE94-008234] p 3767 N94-32752

COST EFFECTIVENESS
Initial estimates of Integrated Maintenance Information System (IMIS) costs and benefits, volume 1
[AD-A276144] p 3565 N94-31830
Design of a logistics model for building and supporting a lunar station
[ILR-MITT-282(1993)] p 3803 N94-31852
A PC program to optimize system configuration for desired reliability at minimum cost p 3823 N94-32438
A user's manual for the cost effectiveness analysis spreadsheet model for aircraft engines (CEAMOD version 2.0)
[AD-A278042] p 3585 N94-33266

COST ESTIMATES
Feasibility study for the recycling of nickel metal hydride electric vehicle batteries
[DE94-000268] p 3690 N94-31598

COST REDUCTION
Status of developing a multifunctional aviation grease
[AD-A276755] p 3656 N94-32184
Thin EFG octagons
[DE94-006855] p 3905 N94-32764
LLNL casting technology
[DE94-008282] p 3669 N94-32839
Innovative fabrication processing of advanced composite materials concepts for primary aircraft structures
[NASA-CR-189558] p 3626 N94-32877
Composite fuselage crown panel manufacturing technology p 3629 N94-33133
Leveraging metal matrix composites to reduce costs in space mechanisms p 3604 N94-33301

COSTS
Design, development, and testing of a lightweight optical sensor cover system p 3604 N94-33302

COULOMB POTENTIAL
Analytic properties of the OCP and ionic mixtures in the strongly coupled fluid state
[DE94-006216] p 3637 N94-32801

COULOMETRY
Employment of a porous gold actuator in ISFET-based coulometric sensor-actuator systems with application to protein characterization
[ISBN-9-09-005887-7] p 3689 N94-31536

COUNTERFLOW
Ignition studies in nonpremixed hydrogen/air combustion
[AD-A275954] p 3632 N94-31348

COUNTERS
Counting particles emitted by stratospheric aircraft and measuring size of particles emitted by stratospheric aircraft
[NASA-CR-195908] p 3769 N94-33170

COUPLING
Instrumentation for EXELFS measurements using convergent beam diffraction coupling to the electron energy loss spectrometer
[USIP-93-07] p 3858 N94-31084
COUPLINGS
Flexible drive shaft coupling
[AD-D016096] p 3727 N94-32718
COVALENCE
Rare Earth Doped Semiconductors and Materials Research Society Symposium Proceedings, Volume 301
[AD-A277517] p 3908 N94-33055
COVALENT BONDS
Rare Earth Doped Semiconductors and Materials Research Society Symposium Proceedings, Volume 301
[AD-A277517] p 3908 N94-33055
COVARIANCE
Line transects, covariance functions and set approximation
[CWI-BS-R9311] p 3846 N94-32084
Note on the variance of autospectral density processed using Welch's method
[DE94-005352] p 3849 N94-32675
Statistical intercomparison of global climate models: A common principal component approach
[DE94-008671] p 3768 N94-32882
COVERINGS
Design and performance of the telescope and detector covers on the Extreme Ultraviolet Explorer satellite
p 3605 N94-33309
CRACK GEOMETRY
Nonlinear effects in interfacial fracture
p 3737 N94-31974
CRACK INITIATION
Thermal-mechanical fatigue crack growth in aircraft engine materials
[ISBN-0-315-86543-1] p 3734 N94-31707
Viscoelastic fracture characterization of polymeric solids p 3652 N94-31745
Cracking induced in small fretting: Application to the case of aeronautical aluminum alloys
[ECL-92-50] p 3735 N94-31870
Fundamental studies in crack initiation
[AD-A278387] p 3741 N94-33356
CRACK OPENING DISPLACEMENT
Stage 1 behavior in a stress corrosion study of Type 304 stainless steel
[DE94-008054] p 3645 N94-32614
Compliance measurements of chevron notched four point bend specimen
[NASA-TM-106538] p 3740 N94-32932
Simpler J(sub Ic) test and data analysis procedures for high strength steels
[AD-A277731] p 3648 N94-33281
CRACK PROPAGATION
High temperature ductility loss in titanium alloys: A review
[DE94-006606] p 3640 N94-31345
Reliability analysis of structural ceramics subjected to biaxial flexure p 3650 N94-31454
Modeling of fracture and damage in quasibrittle materials p 3734 N94-31479
Multiple-site damage in aircraft fuselage structures
[LR-729] p 3578 N94-31675
Thermal-mechanical fatigue crack growth in aircraft engine materials
[ISBN-0-315-86543-1] p 3734 N94-31707
Viscoelastic fracture characterization of polymeric solids p 3652 N94-31745
Acoustic emission from crack growth in 7050 aluminum and 7075 aluminum as a function of temperature and heat treatment
[DREP-CRS-93-15] p 3642 N94-31871
Low velocity impact damage in carbon fiber/PEEK composite laminates
[ISBN-0-315-86546-6] p 3622 N94-31909
Fatigue crack propagation and fractography of 3Y-TZP and ZTA
[ISBN-0-315-86561-X] p 3736 N94-31912
A fracture mechanics methodology for characterizing the performance of flawed polymeric dielectric materials
p 3654 N94-31956
Effects of frequency and amplitude variations of superimposed minor loading sequences on the corrosion fatigue behavior of aircraft structural aluminum alloys
p 3578 N94-31957
Nonlinear effects in interfacial fracture
p 3737 N94-31974
Fracture mechanics and micromechanisms in fiber-reinforced composites p 3622 N94-31986
Fracture and fatigue strength evaluation of multiple site damaged aircraft fuselages - curved panel testing and analysis
[AD-A277100] p 3579 N94-32015
Effects of interphases on the mechanical, thermal and hygromechanical response of fiber-reinforced composites p 3624 N94-32496
The effect of ductile phase (Nb) reinforcement morphology on the mechanical behavior of an intermetallic matrix (MoSi2) p 3615 N94-32500
Mechanics of cracking for composite material
p 3624 N94-32501
Joining of silicon nitrides using oxynitride glasses
[DE94-008517] p 3658 N94-32517
Stage 1 behavior in a stress corrosion study of Type 304 stainless steel
[DE94-008054] p 3645 N94-32614
Fracture micromechanics of continuous fiber and textile reinforced metal and ceramic matrix composites
[AD-A277434] p 3627 N94-33008
Simpler J(sub Ic) test and data analysis procedures for high strength steels
[AD-A277731] p 3648 N94-33281
Fundamental studies in crack initiation
[AD-A278387] p 3741 N94-33356
CRACK TIPS
Viscoelastic fracture characterization of polymeric solids p 3652 N94-31745
Influences of pressure-sensitive yielding and non-singular stress on plane-stress elastic-plastic crack-tip fields p 3737 N94-31965
CRACKING (CHEMICAL ENGINEERING)
Studies of the fundamental nature of catalytic acidity, sites and intermediates
[DE94-006999] p 3646 N94-32805
CRACKING (FRACTURING)
The impact of LDEF results on the space application of metal matrix composites p 3595 N94-31034
Reliability analysis of structural ceramics subjected to biaxial flexure p 3650 N94-31454
Acceptance criteria for weld defects in aluminium weldments
[PB94-138575] p 3735 N94-31841
Toughening mechanisms in fiber-reinforced ceramic-matrix composites p 3622 N94-31943
Nonlinear effects in interfacial fracture
p 3737 N94-31974
Fracture mechanics and micromechanisms in fiber-reinforced composites p 3622 N94-31986
Prediction of hydrogen entry and permeation in metals and alloys
[AD-A276637] p 3642 N94-31995
Fatigue in single crystal nickel superalloys
[AD-A276662] p 3643 N94-32047
Finite element analysis of MB326H Macchi wing lower spar cap fatigue cracks
[AD-A277062] p 3580 N94-32264
The effect of ductile phase (Nb) reinforcement morphology on the mechanical behavior of an intermetallic matrix (MoSi2) p 3615 N94-32500
Mechanics of cracking for composite material
p 3624 N94-32501
Nonlocal theory for fracturing of quasibrittle materials
[AD-A278283] p 3740 N94-33143
Structural integrity of intelligent materials and structures
[AD-A278397] p 3630 N94-33165
A review of weldment failure modes and weldability testing methods
[AD-A278096] p 3729 N94-33251
CRACKS
Processing of novel nanoparticle dispersion strengthened ceramics for improved mechanical performance
[AD-A275965] p 3649 N94-31276
Multiple-site damage in aircraft fuselage structures
[LR-729] p 3578 N94-31675
Finite element analysis of MB326H Macchi wing lower spar cap fatigue cracks
[AD-A277062] p 3580 N94-32264
Compliance measurements of chevron notched four point bend specimen
[NASA-TM-106538] p 3740 N94-32932
CRASHES
Estimating the impact of crashworthiness standards on mortality and morbidity events in the US Army rotary-wing aircraft mishaps
[AD-A277121] p 3575 N94-32363
CRASHWORTHINESS
Estimating the impact of crashworthiness standards on mortality and morbidity events in the US Army rotary-wing aircraft mishaps
[AD-A277121] p 3575 N94-32363
Automatic contact in DYNA3D for vehicle crashworthiness
[DE94-007143] p 3738 N94-32637
CRATERING
Constraints on the Martian cratering rate imposed by the SNC meteorites and Vallis Marineris layered deposits p 3945 N94-33197
CRATERS
Morphology correlation of craters formed by hypervelocity impacts p 3594 N94-31031
Micrometeoroid/space debris effects on materials
p 3595 N94-31032
CRAY COMPUTERS
List ranking and list scan on the CRAY C-90
[AD-A276411] p 3824 N94-31259
Compiler techniques for managing data motion
[AD-A276514] p 3918 N94-31930
CREEP PROPERTIES
Effects of oxidation and creep damage mechanisms on creep behavior in HIPed silicon nitrides
[DE94-006559] p 3618 N94-31313
Viscoelastic fracture characterization of polymeric solids p 3652 N94-31745
Creep-fatigue criteria and inelastic behavior of modified 9Cr-1Mo steel at elevated temperatures
[DE94-007915] p 3642 N94-31918
High temperature materials technology research for advanced thermionic systems
[DE94-008444] p 3644 N94-32416
Joining of silicon nitrides using oxynitride glasses
[DE94-008517] p 3658 N94-32517
CREEP STRENGTH
Effects of oxidation and creep damage mechanisms on creep behavior in HIPed silicon nitrides
[DE94-006559] p 3618 N94-31313
Creep properties of vanadium-base alloys
[DE94-006541] p 3641 N94-31486
CREEP TESTS
Creep properties of vanadium-base alloys
[DE94-006541] p 3641 N94-31486
Creep-fatigue criteria and inelastic behavior of modified 9Cr-1Mo steel at elevated temperatures
[DE94-007915] p 3642 N94-31918
CRETACEOUS-TERTIARY BOUNDARY
Biospheric effects of a large extraterrestrial impact: Case study of the Cretaceous/Tertiary boundary crater
[NASA-CR-195827] p 3942 N94-32740
CRITICAL FREQUENCIES
Analysis of ionospheric parameters in Europe and creation of the prediction algorithm
[AD-A276342] p 3771 N94-31326
CRITICAL TEMPERATURE
High pressure experiments on the Y-Ba-Cu-O superconductors: A major role for holes
[ETN-94-96013] p 3897 N94-31547
CROP GROWTH
Rapid estimates of crop acreage and production at European scale using high resolution imagery
p 3754 N94-32557
Statistical analysis and mapping of cotton and food crop cultivation surfaces in the west of Burkina Faso: Contribution of combined SPOT P and XS data
p 3757 N94-32575
CROP IDENTIFICATION
Monitoring land cover and crop types in Denmark using ERS-1 SAR and optical satellite images
p 3748 N94-32528
Rapid estimates of crop acreage and production at European scale using high resolution imagery
p 3754 N94-32557
European MARS project: The potential integration of SPOT and air- and satellite-borne radar data over two pilot areas for agricultural statistics. PROSPER programme and ERS-1 pilot project
[BRGM-93035] p 3754 N94-32561
Evaluation of surface phase change on large zones
p 3755 N94-32567
CROP INVENTORIES
European MARS project: The potential integration of SPOT and air- and satellite-borne radar data over two pilot areas for agricultural statistics. PROSPER programme and ERS-1 pilot project
[BRGM-93035] p 3754 N94-32561
CROSS FLOW
The effect of an axial flow component on a circular cylinder wake p 3699 N94-31209
CROSS POLARIZATION
Mathematical nonlinear optics
[AD-A277320] p 3882 N94-32510
CROSSLINKING
Electrical communication between glucose oxidase and electrodes based on poly(vinylimidazole) complex of Os(bpy)2Cl2
[AD-A276585] p 3635 N94-32231
Stable second-order nonlinear optical materials based on interpenetrating polymer networks
[AD-A277410] p 3658 N94-32579
Characterization of crosslinked electrooptic polyimides
[DE94-007934] p 3661 N94-32819
A relaxation study of poled nonlinear optical polymers by infrared reflection-absorption spectroscopy
[AD-A277513] p 3663 N94-33054

Second-order nonlinear optical polymers: From fundamentals to applications
[AD-A277514] p 3664 N94-33348
CROSSTALK
III-V compound semiconductor strip-loaded waveguide devices for PICs: Design for minimum crosstalk and high density
[DE94-006588] p 3897 N94-31502
CRUCIBLES
Ultrahigh-current-density metal-ion implantation and diamondlike-hydrocarbon films for tribological applications
[DE94-008958] p 3906 N94-32843
CRUDE OIL
Emissions of greenhouse gases from the use of transportation fuels and electricity
[DE94-006166] p 3765 N94-31625
CRUSTAL FRACTURES
The basement fracture pattern of southern Ontario: A tectonic interpretation based on Landsat TM imagery, airphotos and field data
[ISBN-0-315-87086-9] p 3772 N94-31834
CRYOGENIC COOLING
The 4 K Stirling cryocooler demonstration
[NASA-CR-191792] p 3669 N94-32484
CRYOGENIC EQUIPMENT
Various magnet options for Delta launched version of ASTROMAG
[DE94-006292] p 3955 N94-31635
CRYOGENIC FLUID STORAGE
Aerospace test facilities at NASA LERC Plumbrook
[NASA-TM-109755] p 3602 N94-31814
CRYOGENIC TEMPERATURE
Structural damping studies at cryogenic temperatures
[NASA-TM-109073] p 3740 N94-33118
CRYOGENIC WIND TUNNELS
Structural damping studies at cryogenic temperatures
[NASA-TM-109073] p 3740 N94-33118
CRYOGENICS
Various magnet options for Delta launched version of ASTROMAG
[DE94-006292] p 3955 N94-31635
Controlling hazardous energy sources (lockout/tagout)
[NASA-TM-105290] p 3669 N94-32861
CRYOPUMPING
Divertor pumping and other reactor application issues for H-mode
[DE94-007431] p 3892 N94-32810
CRYOSTATS
Various magnet options for Delta launched version of ASTROMAG
[DE94-006292] p 3955 N94-31635
CRYPTOGRAPHY
PEM public key certificate cache server
[DE94-006404] p 3675 N94-31784
The trustworthy digital camera: Restoring credibility to the photographic image p 3714 N94-32470
CRYSTAL DEFECTS
The 10th International Conference on Internal Friction and Ultrasonic Attenuation in Solids (ICIFUAS)
[AD-A276849] p 3902 N94-32209
Defect cascades produced by neutron irradiation in YBa2Cu3O(7-delta) superconductors
[DE94-007700] p 3903 N94-32372
A scanning defect mapping system for semiconductor characterization p 3885 N94-32446
Microanalytical study of defect formation in thin bismuth strontium calcium copper oxide films
[DE94-008217] p 3661 N94-32751
The path for long range conduction in high J(sub c) TlBa2Ca2Cu3O(8+x) spray-pyrolyzed deposits
[DE94-007211] p 3909 N94-33271
CRYSTAL DISLOCATIONS
Attempts to model the generation of new grain boundaries during the deformation of polycrystals
[DE94-007527] p 3903 N94-32597
Structure, stability, and mechanical properties of intermetallic phases
[DE94-009178] p 3647 N94-32852
CRYSTAL GROWTH
Electrooptic crystal growth and properties
[AD-A276023] p 3896 N94-31439
Characterization and growth mechanisms of the MgAl2O4 phase in Al2O3-reinforced Al-Mg composites
[ISBN-0-315-86531-8] p 3620 N94-31706
In-situ characterization of growth and interfaces in a-Si:H devices
[DE94-000291] p 3760 N94-31812
Thermocapillary convection in evaporating sessile drops
[NASA-TM-109758] p 3705 N94-31886
Chemical vapor deposition of metal nitrides, phosphides, and arsenides
[DE94-008096] p 3654 N94-31976
Oriented Si and Ge nanocrystals formed in Al2O3 by ion implantation and annealing
[DE94-005593] p 3901 N94-32172
Materials processing and manufacturing technologies for diamond substrates multichip modules
[AD-A276904] p 3692 N94-32215
Femtosecond probe-probe transmission studies of LT-grown GaAs near the band edge
[DE94-006660] p 3904 N94-32634
Thin EFG octagons
[DE94-008855] p 3905 N94-32764
Nucleation and growth of cubic boron nitride films produced by ion-assisted pulsed laser deposition
[DE94-007295] p 3661 N94-32796
Development of materials for spectral hole burning applications
[AD-A278408] p 3909 N94-33324
Novel precursor approached for CMC derived by polymer pyrolysis
[AD-A278383] p 3665 N94-33352
CRYSTAL LATTICES
Experimental evidence for lattice effects in high temperature superconductors
[DE94-006250] p 3899 N94-31633
CRYSTAL OPTICS
A noncritically phase matched femtosecond optical parametric oscillator near 3 microns
[DE94-008050] p 3720 N94-32704
CRYSTAL STRUCTURE
Experimental and theoretical studies of hydrogenated amorphous semiconductor alloys and superlattices
[AD-A276159] p 3686 N94-31079
Silicone grease as a precursor to a pseudo crown-ether ligand: Crystal structure of (K(+)K(Me2SiO)7(+)) (Hln(CH2CMe3)3(-))4)
[AD-A276343] p 3895 N94-31327
Incoherent imaging by Z-contrast stem: Towards 1 Angstrom resolution
[DE94-006551] p 3896 N94-31489
Experimental evidence for lattice effects in high temperature superconductors
[DE94-006250] p 3899 N94-31633
The effects of amorphous layer regrowth on carbon activation in GaAs and InP
[DE94-006290] p 3899 N94-31634
Practical neutron training course: Course notes
[PB94-145158] p 3867 N94-31681
Optimization of the forming parameters of PEEK/carbon fiber composite
[ISBN-0-315-86410-9] p 3620 N94-31716
Anomalous small angle x ray scattering studies of amorphous metal-germanium alloys
[DE94-007258] p 3900 N94-32065
The new Metals and Alloys Indexes, search manual: A phase diagram research tool
[DE94-005371] p 3643 N94-32098
SUNY beamline facilities at the National Synchrotron Light Source
[DE94-006343] p 3905 N94-32770
Properties of doped and undoped (Ca,Sr)CuO2 thin films
[DE94-007230] p 3905 N94-32785
Evidence for symmetry breaking local distortions in thallium barium copper oxide
[DE94-006149] p 3907 N94-32944
Low energy ion beam assisted growth of homoepitaxial silicon films at low temperature
[AD-A278092] p 3908 N94-33039
CRYSTAL SURFACES
Characterization and growth mechanisms of the MgAl2O4 phase in Al2O3-reinforced Al-Mg composites
[ISBN-0-315-86531-8] p 3620 N94-31706
CRYSTALLINITY
Experimental and theoretical studies of hydrogenated amorphous semiconductor alloys and superlattices
[AD-A276159] p 3686 N94-31079
Azo polymers for reversible optical storage. 4. Cooperative motion of rigid groups in semicrystalline polymers
[AD-A277107] p 3654 N94-31978
Isomeric poly(benzophenone)s: Synthesis of highly crystalline poly (4, 4 foot-benzophenone) and amorphous poly (2, 5-benzophenone), a soluble poly (p-phenylene) derivative
[AD-A277261] p 3655 N94-32017
The charging effect in high-Tc superconducting thin films
[AD-A277265] p 3900 N94-32040
Amorphous/crystalline structure and phase transformations in metastable semiconducting Ge(1-x)Sn(x)
[DE94-006659] p 3901 N94-32115
CRYSTALLIZATION
Solidification structure synthesis in undercooled liquids
[AD-A276166] p 3910 N94-31054
Silicone grease as a precursor to a pseudo crown-ether ligand: Crystal structure of (K(+)K(Me2SiO)7(+)) (Hln(CH2CMe3)3(-))4)
[AD-A276343] p 3895 N94-31327
Competition between crystallization and mixing/demixing in polymer mixture
[ETN-94-95753] p 3651 N94-31513
Optimization of the forming parameters of PEEK/carbon fiber composite
[ISBN-0-315-86410-9] p 3620 N94-31716
In-situ TEM crystallization of anorthite-glass films on (alpha)-Al2O3
[DE94-006317] p 3652 N94-31780
Strongly coupled ionic mixtures and the H/He EOS
[DE94-006391] p 3934 N94-31782
Amorphous/crystalline structure and phase transformations in metastable semiconducting Ge(1-x)Sn(x)
[DE94-006659] p 3901 N94-32115
CRYSTALLOGRAPHY
Charge-dependent atomic-scale structures of high-index and (110) gold electrode surfaces as revealed by scanning tunneling microscopy
[AD-A276782] p 3869 N94-32170
SUNY beamline facilities at the National Synchrotron Light Source
[DE94-006343] p 3905 N94-32770
Microreflectance infrared study of electron-molecular vibrational coupling and lattice softness in BEDT-TTF salts
[DE94-008490] p 3907 N94-32989
Sensitivity of electrochemical adlayer structure to the metal crystallographic orientation: Potential-independent iodide adsorption on Au(100) in comparison with other low-index surfaces
[AD-A276714] p 3909 N94-33273
CRYSTALS
Stellar x ray polarimeter polarizer development and calibration at LEA/LLNL
[DE94-006400] p 3712 N94-31783
Metal clusters: Dynamics and structure
[AD-A276842] p 3643 N94-32091
On the nature of striae in strontium barium niobate
[DE94-006486] p 3901 N94-32176
The Los Alamos National Laboratory precision double crystal spectrometer
[DE94-008075] p 3713 N94-32706
CUBES (MATHEMATICS)
Least squares approximation by G1 piecewise parametric cubes
[AD-A277978] p 3850 N94-33265
CUES
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-physical cues module, volume 10
[AD-A276977] p 3589 N94-32316
CUMULUS CLOUDS
Boundary-layer cumulus over land: Some observations and conceptual models
[DE93-040820] p 3781 N94-31597
Numerical simulations of monsoon rainfall with the NRL/NCSU regional nestsd grid model p 3782 N94-31791
Cumulus convection parameterization and numerical modelling of moist atmospheres p 3783 N94-31989
CURIE TEMPERATURE
Piezoelectric materials research in Europe
[AD-A276207] p 3648 N94-31059
CURING
Intramolecular charge transfer complexes as fluorescence probes for UV and visible light induced acrylate polymerization
[AD-A277129] p 3657 N94-32381
CURRENT DENSITY
Noninductive current drive experiments on D3-D, and future plans
[DE94-007373] p 3886 N94-31324
CURRENT DISTRIBUTION
Noninductive current drive experiments on D3-D, and future plans
[DE94-007373] p 3886 N94-31324
The form factors of the nucleons
[DE94-007096] p 3872 N94-32630
Multicast communication with guaranteed quality of service
[AD-A277650] p 3682 N94-33025
CURVED PANELS
Fracture and fatigue strength evaluation of multiple site damaged aircraft fuselages - curved panel testing and analysis
[AD-A277100] p 3579 N94-32015
Innovative fabrication processing of advanced composite materials concepts for primary aircraft structures
[NASA-CR-189558] p 3626 N94-32877

CURVES (GEOMETRY)
Least squares approximation by G1 piecewise parametric cubes
[AD-A277978] p 3850 N94-33265
CYANIDES
Time-resolved infrared absorption studies applied to the study of radical plus molecule reactions
[DE94-005921] p 3863 N94-31202
Infrared spectroelectrochemical study of cyanide adsorption and reactions at platinum electrodes in aqueous perchlorate electrolyte
[AD-A276402] p 3631 N94-31238
Scanning tunneling microscopy and infrared spectroscopy as combined in-situ probes of electrochemical adlayer structure: Cyanide on Pt(111)
[AD-A276715] p 3909 N94-33274
CYANO COMPOUNDS
Time-resolved infrared absorption studies applied to the study of radical plus molecule reactions
[DE94-005921] p 3863 N94-31202
CYCLIC COMPOUNDS
Metal ion complexation by ionizable crown ethers
[DE94-008301] p 3661 N94-32847
CYCLIC HYDROCARBONS
Electronic and nuclear factors in intramolecular charge and excitation transfer processes
[DE94-006598] p 3870 N94-32178
High-energy chemical processes: Laser irradiation of aromatic hydrocarbons
[DE94-008107] p 3720 N94-32707
CYCLIC LOADS
Effects of frequency and amplitude variations of superimposed minor loading sequences on the corrosion fatigue behavior of aircraft structural aluminum alloys
p 3578 N94-31957
The cyclic fatigue behaviour of adhesive joints
[AD-A277080] p 3738 N94-32351
Effect of elevated temperature and cyclic loading on properties and damage modes in ceramic composites
[DE94-008736] p 3662 N94-32891
CYCLOGENESIS
The influence of cumulus parameterization on model forecasts of rapid oceanic cyclogenesis
[AD-A277207] p 3784 N94-32094
CYCLOHEXANE
Photopolymerization of cyclohexene oxide: A visible light initiating system and mechanistic investigations
[AD-A277110] p 3654 N94-31981
CYCLONES
Short term teleconnections associated with an individual tropical cyclone
[AD-A277210] p 3783 N94-32019
Recurvature dynamics of a typhoon
[AD-A276792] p 3784 N94-32164
Tropical cyclone forecasters reference guide. 5: Numerical track forecast guidance
[AD-A277318] p 3785 N94-32278
Forecasters handbook for the Philippine Islands and surrounding waters
[AD-A277993] p 3787 N94-33089
CYCLOTRON RADIATION
Noninductive current drive experiments on D3-D, and future plans
[DE94-007373] p 3886 N94-31324
Electron cyclotron resonance plasma oxidation studies of InP
[AD-A277431] p 3893 N94-33007
CYCLOTRON RESONANCE
Electron cyclotron resonance plasma oxidation studies of InP
[AD-A277431] p 3893 N94-33007
CYCLOTRON RESONANCE DEVICES
Fusion applications of high power millimeter wave sources
[DE94-007374] p 3718 N94-32202
Gyrotrons and free electron lasers for atmospheric sensing
[AD-A277281] p 3718 N94-32406
CYLINDRICAL BODIES
An efficient three-dimensional Poisson solver for SIMD high-performance-computing architectures
p 3823 N94-31120
Scattering of a random acoustic field by an infinite cylinder: Application to the modelization of the acoustic environment of the 'Ariane 5' launcher scale-model using experimental data
[ONERA-NT-1993-11] p 3860 N94-31226
Small cylindrical adhesive bonds
[PB94-148210] p 3651 N94-31585
A thermal viscoelastic analysis for thick-walled composite cylinders
[AD-A274143] p 3625 N94-32604
CYLINDRICAL SHELLS
Deformation and rupture of cylindrical shells under dynamic loading p 3733 N94-31288
Tearing resistance of a thin shell against projectile penetration: Material property effects
[DE94-007466] p 3733 N94-31316
CZOCHRALSKI METHOD
On the nature of striae in strontium barium niobate
[DE94-006486] p 3901 N94-32176

D

DAMAGE
A laboratory study of multiple site damage in fuselage lap splices
[AD-A276151] p 3578 N94-31078
Vibration control and design of composite cantilevers taking into account structural uncertainties and damage
p 3733 N94-31213
Modeling of fracture and damage in quasibrittle materials p 3734 N94-31479
Engineering of damage in ion implanted silicon
[ISBN-9-09-005097-3] p 3897 N94-31521
Methodology for damage study of a tube-grill contact
[ECL-92-49] p 3734 N94-31562
Damage tolerance aspects of a full composite airplane fuselage: Requirements, modelling, predictions, experiments
[LR-728] p 3578 N94-31674
Multiple-site damage in aircraft fuselage structures
[LR-729] p 3578 N94-31675
Finite element analysis of damage in fibrous composites using a micromechanical model
[AD-A277226] p 3623 N94-32024
Dual-band infrared imaging to detect corrosion damage within airframes and concrete structures
[DE94-006047] p 3580 N94-32658
Effect of elevated temperature and cyclic loading on properties and damage modes in ceramic composites
[DE94-008736] p 3662 N94-32891
Comparison of resin film infusion, resin transfer molding, and consolidation of textile preforms for primary aircraft structure p 3630 N94-33136
DAMAGE ASSESSMENT
Low-Earth orbit effects on organic composite materials flown on LDEF p 3595 N94-31036
Summary of materials and hardware performance on LDEF p 3595 N94-31037
Methodology for damage study of a tube-grill contact
[ECL-92-49] p 3734 N94-31562
Evaluation of Fluorescence Line Imager (FLI) airborne imaging spectrometer data for roadside tree damage assessment p 3745 N94-31866
Ultrasonic characterization of damage in a simulated CF-18 composite structure
[DREP-LN-93-26] p 3730 N94-31872
Computer modelling of cyclic deformation of high-temperature materials
[AD-A277056] p 3623 N94-32012
Assessment of impact damage in composite structures
[AD-A277063] p 3624 N94-32265
Remote sensing for hurricane Andrew impact assessment p 3758 N94-32464
Feasibility in the use of satellite remote sensing data as a fast reaction tool for natural disaster relief
p 3748 N94-32526
Automatic contact in DYNA3D for vehicle crashworthiness
[DE94-007143] p 3738 N94-32637
Fundamental studies in crack initiation
[AD-A278387] p 3741 N94-33356
DAMPING
Chaotic attitude motion of satellites in the central gravitational field
[ISBN-0-315-78768-6] p 3610 N94-31723
Attitude dynamics of spinning rockets in space with internal mass motion p 3601 N94-31802
Mass-loaded coating for reducing the resonant frequency of a ceramic disc
[AD-D016095] p 3660 N94-32739
Interpenetrating polymer network acoustic damping material
[AD-D016141] p 3663 N94-32975
Deployable and retractable telescoping tubular structure development p 3607 N94-33317
DASSAULT AIRCRAFT
Prospects for the French fighter industry in a post-cold war environment: Is the future more than a mirage?
p 3565 N94-31959
DATA ACQUISITION
A generic model for data acquisition: Connectionist methods of information processing
[TELECOM-93-E-003] p 3730 N94-31166
Ground based radiometric and atmospheric measurements p 3744 N94-31855
Recommendations for meteorological data collection during physiological field studies
[AD-A276834] p 3901 N94-32153
Spacecraft On-Board Information Extraction Computer (SOBIEC) p 3808 N94-32433
Pen-based computers: Computers without keys
p 3808 N94-32434
Using the National Information Infrastructure for social science, education, and informed decision making
[DE94-005442] p 3920 N94-32676
A miniaturized ASIC-based multichannel scaler instrument
[DE94-007222] p 3807 N94-32783
Preliminary evaluation of the University of South Florida Mobile Data Acquisition System, the Idaho National Engineering Laboratory Versatile Data Acquisition System, and the Autologger Vehicle User Survey System produced by Instrumental Solutions of Ottawa, Canada for the Site Operator Program Field Data Collection
[DE94-008514] p 3920 N94-32827
A flexible IBM-PC based data acquisition system for nuclear physics experiments
[USIP-92-02] p 3922 N94-32856
Accelerated reliability testing utilizing design of experiments
[AD-A277989] p 3732 N94-33088
Statistical characteristics of bistatic surface scatter and mean bistatic surface scattering strengths
[AD-A278155] p 3862 N94-33096
Performance statistics bulletin. High latitude meteor scatter propagation, June, July, August, September 1992
[AD-A277508] p 3685 N94-33347
DATA BASE MANAGEMENT SYSTEMS
LDEF materials special investigation group's data bases p 3596 N94-31038
Transformation of database populations and operations from the conceptual to the internal level
[TR-92-27] p 3916 N94-31175
Report on implementing part relationships using VML metaclasses
[PB94-147485] p 3813 N94-31686
The advent of failure analysis software technology
[DE94-006593] p 3692 N94-32111
CMS Distribution Subsystem user's guide
[DE94-005328] p 3816 N94-32146
Atomic and molecular data needs for fusion
[DE94-006555] p 3870 N94-32177
Moving BASISplus and TECHLIBplus from VAX/VMS to UNIX
[DE94-004696] p 3826 N94-32248
The intelligent monitoring system: Generic Database Interface (GDI). Revised user manual
[AD-A277131] p 3919 N94-32382
An intelligent interactive visual database management system for Space Shuttle closeout image management
p 3923 N94-32469
A simulation of uncertain reasoning on parametric databases using data-dependency derived inference nets p 3919 N94-32499
Managing performance of DB2 Ad Hoc Reports
[DE94-006669] p 3920 N94-32635
Developing a personal-computer-based records retention system using Paradox(tm)
[DE94-007984] p 3819 N94-32749
The hypermedia technology as front end to knowledge processing systems p 3854 N94-33343
DATA BASES
LDEF materials special investigation group's data bases p 3596 N94-31038
Databases and demands for solar heating materials
[PB94-137494] p 3758 N94-31070
Transformation of database populations and operations from the conceptual to the internal level
[TR-92-27] p 3916 N94-31175
A probabilistic view of Datalog parallelization
[TELECOM-93-D-021] p 3824 N94-31183
The meaning of duplicates in the relational database model
[CT-93-04] p 3916 N94-31392
The Global Climatology Network precipitation data
[DE93-019199] p 3764 N94-31596
Hydrologic Database user's manual
[DE94-003950] p 3743 N94-31603
Current Research Information in Europe: Conference proceedings
[PB94-127933] p 3917 N94-31768
Texture library for 3-dimensional visualization systems
[AD-A276125] p 3917 N94-31829
Systems for the monitoring of working conditions relating to health and safety: Extensive description. Norway
[PB94-138542] p 3803 N94-31839
Shiptrack database analysis
[AD-A277226] p 3746 N94-32025
Experiences with EDO: An Evolutionary Database Optimizer
[TR-93-23] p 3918 N94-32105

Coordination of mesoscale meteorological research between ASL and European group
[AD-A276730] p 3784 N94-32162
EVORM: A conceptual modelling technique for evolving application domains
[TR-93-16] p 3918 N94-32290
Fiber optic chemical sensors
[AD-A277128] p 3881 N94-32380
The intelligent monitoring system: Generic Database Interface (GDI). Revised user manual
[AD-A277131] p 3919 N94-32382
Analytical Design Package (ADP2): A computer aided engineering tool for aircraft transparency design
p 3823 N94-32430
High-speed data search p 3923 N94-32441
Database tomography for commercial application
p 3923 N94-32442
Mapping analysis and planning system for the John F. Kennedy Space Center p 3757 N94-32463
Space flight risk data collection and analysis project: Risk and reliability database
[NASA-CR-195879] p 3603 N94-32494
Using the National Information Infrastructure for social science, education, and informed decision making
[DE94-005442] p 3920 N94-32676
Preliminary evaluation of the University of South Florida Mobile Data Acquisition System, the Idaho National Engineering Laboratory Versatile Data Acquisition System, and the Autologger Vehicle User Survey System produced by Instrumental Solutions of Ottawa, Canada for the Site Operator Program Field Data Collection
[DE94-008514] p 3920 N94-32827
MDFF HELP library, version 2: On-line documentation for the map data formatting facility
[AD-A277763] p 3922 N94-32987
Briefing and review meeting implementation of the military handbook 17 for polymer matrix and metal matrix composites
[AD-A277446] p 3663 N94-33010
COINS: A composites information database system
p 3627 N94-33123
DTIC Thesaurus on diskette with dBase 4.1 runtime (computer diskette)
[AD-M000306] p 3922 N94-33256
DTIC Thesaurus on diskette without runtime (computer diskette)
[AD-M000310] p 3923 N94-33258
DTIC Thesaurus on diskette without runtime (computer diskette)
[AD-M000312] p 3923 N94-33259
A new method for calculating wing along aerodynamics to angle of attack 180 deg
[AD-A277965] p 3574 N94-33263
Performance statistics bulletin. High latitude meteor scatter propagation, June, July, August, September 1992
[AD-A277508] p 3685 N94-33347

DATA COMPRESSION

Regular wavelets: Application to fixed image compression
[TELECOM-93-E-004] p 3858 N94-31167
Texture library for 3-dimensional visualization systems
[AD-A276125] p 3917 N94-31829
Applications of data compression to 3-D scalar field visualization p 3817 N94-32294
Neural network wavelet technology: A frontier of automation p 3839 N94-32425
MDFF HELP library, version 2: On-line documentation for the map data formatting facility
[AD-A277763] p 3922 N94-32987
Data processing algorithms for on-board satellite event analysis
[AD-A278406] p 3838 N94-33168

DATA CONVERSION ROUTINES

System for monitoring and analyzing field energy exposure
[AD-D016115] p 3681 N94-32625

DATA CORRELATION

Alternatives to hierarchical techniques in stereo correlation
[AD-A276570] p 3746 N94-31938

DATA FLOW ANALYSIS

An analysis of instruction-cached SIMD computer architecture
[AD-A276519] p 3806 N94-31934
Automated detection of ship tracks in multispectral satellite data
[AD-A276697] p 3746 N94-32119
Assessing the vulnerability of multi-commodity networks with failing components
[AD-A278434] p 3684 N94-33334

DATA INTEGRATION

Information acquisition from multi-agent resources; abstract
[LP-93-08] p 3917 N94-31452
Fusion of multispectral (XS) and Panchromatic (P) SPOT images and radar images p 3750 N94-32541

DATA LINKS

Study of structures of different complexity for the communication between two processors
[ETN-94-95750] p 3674 N94-31615
High frequence and automatic link establishment (HF and ALE) radio propagation test to Antarctica
[AD-A277730] p 3682 N94-33001
An analysis of cellular telephone and INMARSAT systems for providing radio data link computer communications for US Navy vessels
[AD-A278143] p 3684 N94-33160

DATA MANAGEMENT

Model borne data management system for wind tunnel testing, phase 2
[AD-A276296] p 3587 N94-31295
CMS Preprocessing Subsystem user's guide: Software version 2.0
[DE94-005327] p 3816 N94-32145
Atomic and molecular data needs for fusion
[DE94-006555] p 3870 N94-32177
Untying the gordian data knot. A paper on Information Engineering (IE) and Corporate Information Management (CIM)
[AD-A276862] p 3918 N94-32210
An algorithm for probabilistic, totally-ordered temporal projection
[AD-A277341] p 3817 N94-32257
Description of DCS (Data Converting System) and CT (Cone Tool). A reprint of a note published in Fire and Materials titled Fire Test Data Available for Your Purpose
[PB94-138559] p 3918 N94-32293
The intelligent monitoring system: Generic Database Interface (GDI). Revised user manual
[AD-A277131] p 3919 N94-32382
Automated mainframe data collection in a network environment p 3923 N94-32443

DATA PROCESSING

Radar measurements p 3685 N94-31002
Filtering of satellite altimetry data with optimal smoothing cubic splines to compute geoid heights, along-tract geoid and gravity gradients in the Indonesian waters and its surroundings
[PB94-147527] p 3741 N94-31074
Summary of some data processing routines in the molecular physics group of Stockholm University
[USIP-93-05] p 3808 N94-31087
Entropy, information (and image), part 1
[TELECOM-93-D-009] p 3910 N94-31098
First-wall heat-flux measurements during ELMing H-mode plasma
[DE94-008310] p 3888 N94-31765
The European Imaging Spectroscopy Airborne Campaign (EISAC). Data takes and evaluation programme: An overview p 3743 N94-31854
Noninvasive spectral analysis and beam mapping of focused ultrasound, part 2
[AD-A276629] p 3861 N94-32059
CMS Preprocessing Subsystem user's guide: Software version 2.0
[DE94-005327] p 3816 N94-32145
MULTIGRAPH: An architecture for model-based programming. Model-based program synthesis for parallel computing. PREMOS: Programming environment for model-based program synthesis, version 01.00.00
[AD-A276949] p 3817 N94-32219
Self-consistent effects of magnetospheric hydromagnetic waves on ring current ions
[AD-A277406] p 3774 N94-32346
Spacecraft On-Board Information Extraction Computer (SOBIEC) p 3808 N94-32433
Note on the variance of autospectral density processed using Welch's method
[DE94-005352] p 3849 N94-32675
MDFF HELP library, version 2: On-line documentation for the map data formatting facility
[AD-A277763] p 3922 N94-32987
Earth observational research using multistage EOS-like data
[NASA-CR-195833] p 3757 N94-33019
Fine and microstructure observations at Fieberlin g Guyot R/V new horizon cruise report
[AD-A277917] p 3791 N94-33109
Cruise report: Oceanus 250 leg 4 high resolution profiler survey for the North Atlantic Tracer Release Experiment, 25 March - 24 April, 1992
[AD-A277935] p 3791 N94-33245

DATA PROCESSING EQUIPMENT

A flexible IBM-PC based data acquisition system for nuclear physics experiments
[USIP-92-02] p 3922 N94-32856

DATA RECORDING

Model borne data management system for wind tunnel testing, phase 2
[AD-A276296] p 3587 N94-31295

DATA REDUCTION

Multiple regression and measurement errors: Relative efficiency of two models, the standard model and Fuller's model, for estimating structural relationships
[ISBN-0-315-86834-1] p 3845 N94-31755
A critical assessment of UH-60 main rotor blade airfoil data
[NASA-TM-103985] p 3571 N94-32063
Automated detection of ship tracks in multispectral satellite data
[AD-A276697] p 3746 N94-32119
BATSE data analysis
[NASA-CR-195818] p 3927 N94-32942
Analysis of data from the plasma composition experiment on the International Sun-Earth Explorer (ISEE 1)
[NASA-CR-195880] p 3893 N94-33074
Data processing algorithms for on-board satellite event analysis
[AD-A278406] p 3838 N94-33168

DATA RETRIEVAL

Automated mainframe data collection in a network environment p 3923 N94-32443

DATA SAMPLING

Application of radon transformation for improved analysis of sparsely sampled data: A feasibility study
[PB94-147535] p 3741 N94-31075

DATA STORAGE

Compiler techniques for managing data motion
[AD-A276514] p 3918 N94-31930
A redundant disk array architecture for efficient small writes
[AD-A276645] p 3815 N94-31940
An MS-DOS file system for UNIX
[AD-A276523] p 3816 N94-32081
Using TSAR with the post-processing far-field option
[DE94-006615] p 3679 N94-32188
Toroidal computer memory for serial and parallel processors
[AD-D016144] p 3807 N94-32978
DTIC Thesaurus on diskette (ASC2) (computer diskette)
[AD-M000309] p 3922 N94-33257

DATA STRUCTURES

Transformation of database populations and operations from the conceptual to the internal level
[TR-92-27] p 3916 N94-31175
Detecting the erosion of hierarchic information structures
[RUU-CS-93-10] p 3916 N94-31365
The meaning of duplicates in the relational database model
[CT-93-04] p 3916 N94-31392
Extension of the LUSTRE language and application to circuit design: The LUSTRE V4 language and the POLLUX system
[ETN-94-95918] p 3812 N94-31543
Report on implementing part relationships using VML metaclasses
[PB94-147485] p 3813 N94-31688
An MS-DOS file system for UNIX
[AD-A276523] p 3816 N94-32081

DATA SYSTEMS

CMS Preprocessing Subsystem user's guide: Software version 2.0
[DE94-005327] p 3816 N94-32145
CMS Distribution Subsystem user's guide
[DE94-005328] p 3816 N94-32146
Untying the gordian data knot. A paper on Information Engineering (IE) and Corporate Information Management (CIM)
[AD-A276862] p 3918 N94-32210
High-speed data search p 3923 N94-32441

DATA TRANSFER (COMPUTERS)

Sandia's research network for Supercomputing 1993: A demonstration of advanced technologies for building high-performance networks
[DE94-005319] p 3823 N94-31149
The FELICIA bulletin board system and the IRBIS anonymous FTP server: Computer security information sources for the DOE community
[DE94-008219] p 3825 N94-31920
Compiler techniques for managing data motion
[AD-A276514] p 3918 N94-31930
An MS-DOS file system for UNIX
[AD-A276523] p 3816 N94-32081
Description of DCS (Data Converting System) and CT (Cone Tool). A reprint of a note published in Fire and Materials titled Fire Test Data Available for Your Purpose
[PB94-138559] p 3918 N94-32293
Communication networks for autonomous mobile robot computer architectures and distributed real-time computing p 3680 N94-32310
IRIG J asynchronous ASCII time code formats
[AD-A277244] p 3681 N94-32332

Automated mainframe data collection in a network environment p 3923 N94-32443

DATA TRANSMISSION

Channel equalization for block transmission systems [TELECOM-93-D-002] p 3670 N94-31093

Towards simplicity: Noise and cooperation in the perfect integrator [AD-A276256] p 3799 N94-31291

Communications networks in stressed environments [AD-A275967] p 3672 N94-31384

Development of a low-latency scalar communication routine on message-passing architectures [DE94-007061] p 3827 N94-32683

COVICS: A covert video communications system [DE94-007568] p 3682 N94-32745

Long distance transmission of 15 Gb/s digital using subcarrier multiplexing and external modulation [DE94-008298] p 3682 N94-32756

DAYGLOW

An analysis of ionospheric dayglow from observations of the Naval Postgraduate School Middle Ultraviolet Spectrograph (MUSTANG) [AD-A277351] p 3773 N94-32335

DE HAVILLAND AIRCRAFT

Shearographic inspection of a DeHavilland DHC-7 [AD-A276716] p 3566 N94-32157

DEACTIVATION

The development of precipitated iron catalysts with improved stability [DE94-008711] p 3638 N94-32886

DEBONDING (MATERIALS)

Fracture mechanics and micromechanisms in fiber-reinforced composites p 3622 N94-31986

Mechanics of failure of high temperature metal matrix composites [AD-A277397] p 3624 N94-32342

DEBRIS

Using Monte Carlo techniques and parallel processing for debris hazard analysis of rocket systems [DE94-007250] p 3609 N94-31382

DECISION MAKING

An analysis of non-integerizing the aircraft engines Cost Effectiveness Analysis Spreadsheet Model (CEAMOD version 2.0) [AD-A276251] p 3583 N94-31290

An active computer supported medium for distributed planning in enterprises [ETN-94-95738] p 3829 N94-31372

Pairwise-comparison using the logarithmic least squares method and the generalized pseudoinverse [REPT-93-84] p 3844 N94-31701

Control of a random walk with noisy delayed information [CWI-BS-R9316] p 3846 N94-32108

New approaches for real time decision support systems p 3915 N94-32426

Knowledge-based commodity distribution planning p 3915 N94-32427

The limits of intelligence in design [DE94-004668] p 3819 N94-32668

Using the National Information Infrastructure for social science, education, and informed decision making [DE94-005442] p 3920 N94-32676

Ethics and rationality in information-enriched decisions: A model for technical communication [DE93-040251] p 3681 N94-32679

Selection criteria and facilitation training for the study of groupware [NASA-CR-195906] p 3822 N94-33114

A decision support system for electronic warfare analysts p 3853 N94-33336

DECISION THEORY

Tractable deduction in some fragments of auto-epistemic logic [REPT-93-89] p 3844 N94-31673

Hierarchical mixtures of experts and the EM algorithm [AD-A276516] p 3814 N94-31932

DECODERS

Design, performance, and test standards for flight termination receivers/decoders. Volume 1: Design and performance requirements [AD-A277245] p 3602 N94-32333

DECODING

Methods of implementing the Viterbi algorithm on a massively parallel computer of the SIMD (single instruction multiple data) type [ISBN-0-315-86783-3] p 3814 N94-31752

DECOMPOSITION

Characterization of polymer decomposition products by laser desorption mass spectrometry p 3597 N94-31046

Evidence for a correct SiO2 voltage acceleration model [DE94-006578] p 3690 N94-31594

Group 12 thiolates: Syntheses, characterization and decomposition pathways [AD-A277055] p 3900 N94-32011

Parallel supercomputing: Advanced methods, algorithms, and software for large-scale linear and nonlinear problems [DE94-008446] p 3836 N94-32992

Effective computational strategy for predicting the response of complex systems [AD-A277452] p 3740 N94-33011

Perfluoropolyalkylether decomposition on catalytic aluminas [NASA-TM-106547] p 3617 N94-33021

DECONTAMINATION

Study of type 2 and 3 anodized Al 5052-0 in aqueous DS2 solutions [AD-A276960] p 3644 N94-32240

An investigation of the radiolytic stability of a resorcinol-formaldehyde ion exchange resin [DE94-007971] p 3660 N94-32698

DECOUPLING

Thin-film decoupling capacitors for multi-chip modules [DE94-007743] p 3695 N94-32650

DEDUCTION

Tractable deduction in some fragments of auto-epistemic logic [REPT-93-89] p 3844 N94-31673

DEEP SPACE NETWORK

The quest for contact [NASA-TM-109778] p 3806 N94-32389

DEEP WATER

Estimating subpycnocline density fluctuations in the California current region from upper ocean observations [AD-A277278] p 3789 N94-32325

Deep water studies of CTD data [AD-A277741] p 3791 N94-33176

DEFECTS

Atomic oxygen interaction at defect sights in protective coatings on polymers flown on LDEF p 3593 N94-31024

Passivation of III-V compound semiconductor based devices [AD-A276178] p 3894 N94-31056

Experimental and theoretical studies of hydrogenated amorphous semiconductor alloys and superlattices [AD-A276159] p 3686 N94-31079

The role of defects in laser damage of multilayer coatings [DE94-006731] p 3714 N94-31269

Rotordynamic effects driven by fluid forces from a geometrically imperfect labyrinth [AD-A276424] p 3722 N94-31333

The threshold energy for defect production in SiC: A molecular dynamic study [DE94-007123] p 3896 N94-31499

Engineering of damage in ion implanted silicon [ISBN-9-09-005097-3] p 3897 N94-31521

Defect-solute interactions near irradiation grain boundaries [DE94-006215] p 3641 N94-31627

In-situ characterization of growth and interfaces in a-Si:H devices [DE94-000291] p 3760 N94-31812

Research on the stability, electronic properties, and structure of a-Si:H and its alloys [DE94-000292] p 3899 N94-31813

Acceptance criteria for weld defects in aluminium weldments [PB94-136575] p 3735 N94-31841

Fracture and fatigue strength evaluation of multiple site damaged aircraft fuselages - curved panel testing and analysis [AD-A277100] p 3579 N94-32015

Shearographic inspection of a DeHavilland DHC-7 [AD-A276716] p 3566 N94-32157

Temperature-humidity-bias aging technique to identify defective surface mount capacitors [DE94-005354] p 3660 N94-32727

Space flight printed wiring board measling investigation [NASA-TM-104602] p 3732 N94-33101

DEFENSE PROGRAM

NATO contributions to European environmental security [AD-A275918] p 3763 N94-31275

DoD information systems capacity management function [AD-A275987] p 3916 N94-31355

V-22: Dual-use technology or red herring? [AD-A276577] p 3579 N94-32058

Application of Artificial Intelligence to the DoD Corporate Information Management (CIM) program [AD-A276656] p 3834 N94-32061

Lifting the fog of corporate information management [AD-A276680] p 3918 N94-32090

A comparison of military and commercial aircraft development [AD-A276830] p 3575 N94-32168

Common modeling system for digital simulation p 3823 N94-32429

DTIC Thesaurus on diskette with dBase 4.1 runtime (computer diskette) [AD-M000306] p 3922 N94-33256

DTIC Thesaurus on diskette without runtime (computer diskette) [AD-M000310] p 3923 N94-33258

DTIC Thesaurus on diskette without runtime (computer diskette) [AD-M000312] p 3923 N94-33259

DEFINITION

Legal regime of human activities in outer space law p 3599 N94-31431

DEFLAGRATION

Reactive flows in compact objects p 3934 N94-31567

DEFLECTION

Deformation and rupture of cylindrical shells under dynamic loading p 3733 N94-31288

Fast acting optical deflection [AD-A276630] p 3879 N94-32037

Photothermal laser deflection, an innovative technique to measure particles in exhausts [AD-A277151] p 3718 N94-32366

A case study of analysis methods for large deflections of a cantilever beam [NASA-TM-108454] p 3739 N94-32903

DEFORMATION

Patterns of deformation and volcanic flows associated with lithospheric loading by large volcanoes on Venus p 3776 N94-31106

Vibration control and design of composite cantilevers taking into account structural uncertainties and damage p 3733 N94-31213

Computer modelling of cyclic deformation of high-temperature materials [AD-A277056] p 3623 N94-32012

High temperature materials technology research for advanced thermionic systems [DE94-008444] p 3644 N94-32416

DEGENERATION

Degenerate four-wave mixing as a diagnostic of plasma chemistry [DE94-008588] p 3889 N94-31766

DEGRADATION

Space environment durability of beta cloth in LDEF thermal blankets p 3591 N94-31015

Degradation of optical components in space p 3594 N94-31029

Physical properties of glasses exposed to Earth-facing and trailing-side environments on LDEF p 3594 N94-31030

Analysis of GER imaging spectrometry data for the identification of soil and vegetation parameters in land degradation studies p 3744 N94-31857

Combined contamination and space environmental effects on solar cells and thermal control surfaces [NASA-TM-106592] p 3617 N94-33022

Depth-diameter ratios for Martian impact craters: Implications for target properties and episodes of degradation p 3943 N94-33191

DEGREES OF FREEDOM

Six degree of freedom flight dynamic model of a Mk-82 store [AD-A277065] p 3580 N94-32362

Design and Monte Carlo analysis of an unmanned aerial vehicle [AD-A277648] p 3580 N94-33056

Design, characterization, and control of the NASA three degree of freedom reaction compensation platform p 3605 N94-33304

DEHYDRATED FOOD

Novel ultrasonic method for food hydration [AD-A277411] p 3804 N94-32580

DEHYDRATION

Novel ultrasonic method for food hydration [AD-A277411] p 3804 N94-32580

DEICING

Aircraft icing handbook (update) [AD-A276499] p 3574 N94-31678

WHIPICE --- computer program for analysis of aircraft deicing [NASA-TM-109749] p 3574 N94-31803

Continuous measurement of aircraft wing icing p 3576 N94-32454

DELAMINATING

Ultrasonic characterization of damage in a simulated CF-18 composite structure [DREP-LN-93-26] p 3730 N94-31872

Low velocity impact damage in carbon fiber/PEEK composite laminates [ISBN-0-315-86546-6] p 3622 N94-31909

Structural integrity of intelligent materials and structures
[AD-A278397] p 3630 N94-33165

DELAY
The generalized multi delay adaptive filter: Structure and convergence analysis
[TELECOM-93-D-004] p 3808 N94-31094
Civil tiltrotor market penetration: Effects on Northeast corridor airport delay
[AD-A277534] p 3576 N94-32955

DELTA WINGS
Shock-dependent, optimum thrust wings in supersonic flow p 3570 N94-32027

DELTAS
Martian deltas: Morphology and distribution p 3950 N94-33230

DEMODULATION
Phase-lock roll control of inertially pointing spacecraft p 3609 N94-31470
A technique for multiplexing 3x3-coupler terminated interferometric fiber-optic sensors
[AD-A276739] p 3880 N94-32180

DEMULTIPLEXING
A technique for multiplexing 3x3-coupler terminated interferometric fiber-optic sensors
[AD-A276739] p 3880 N94-32180

DENMARK
Monitoring land cover and crop types in Denmark using ERS-1 SAR and optical satellite images p 3748 N94-32528

DENSIFICATION
Ion-irradiation-induced densification of zirconia sol-gel thin films
[DE94-006248] p 3656 N94-32103
Pressureless sintering of ceramic composites
[AD-A277274] p 3657 N94-32404

DENSITY (MASS/VOLUME)
Effect of irradiation damage and helium on the swelling and structure of vanadium-base alloys
[DE94-006540] p 3641 N94-31666

DENSITY DISTRIBUTION
Estimating subpycnocline density fluctuations in the California current region from upper ocean observations
[AD-A277278] p 3789 N94-32325

DENSITY MEASUREMENT
An overview of the Evaluation of Oxygen Interaction with Materials-third phase (EOIM-3) experiment: Space Shuttle Mission 46 p 3596 N94-31040
Using laser absorption spectroscopy to monitor composition and physical properties of metal vapors
[DE94-001530] p 3716 N94-31599
Measurement of viscosity, density, and gas solubility of refrigerant blends in selected synthetic lubricants
[DE94-007723] p 3653 N94-31917
Estimating subpycnocline density fluctuations in the California current region from upper ocean observations
[AD-A277278] p 3789 N94-32325

DEPENDENCE
The decidability of dependency in intuitionistic propositional logic
[ML-93-20] p 3856 N94-31410

DEPLETION
Electron: Cluster interactions
[DE94-009089] p 3874 N94-32807

DEPLOYMENT
Deployable and retractable telescoping tubular structure development p 3607 N94-33317
The Galileo high gain antenna deployment anomaly p 3807 N94-33319

DEPOSITION
Electrostatic reduction of particulates for laser resistant hafnia coatings
[DE94-005824] p 3651 N94-31557
Deposition of DLC via intense ion beam ablation
[DE94-005583] p 3651 N94-31650
Low energy ion beam assisted growth of homoepitaxial silicon films at low temperature
[AD-A278092] p 3908 N94-33039
Induced adsorption of chloride and bromide by submonolayer amounts of copper underpotentially deposited on Pt(111)
[AD-A278023] p 3648 N94-33182
Deposition rates of oxidized iron on Mars p 3945 N94-33198
Obliquity variation in a Mars climate evolution model p 3951 N94-33236
Novel sol-gel deposition for repair of conducting paths in polyceramic systems
[AD-A278381] p 3664 N94-33350

DEPOSITS
The zinc electrode: Reactions and mechanisms
[DE94-007977] p 3691 N94-31919
Geologic controls of erosion and sedimentation on Mars p 3951 N94-33232
Polar sediment accumulation: Role of surface winds at the two poles p 3951 N94-33233
Carbonates, surfates, phosphates, nitrates, and organic materials: Their association in a Martian meteorite p 3952 N94-33239

DERIVATION
First theory institute on computational differentiation
[DE94-006491] p 3841 N94-31309

DESERTIFICATION
Climatic evolution and desertization p 3780 N94-31009

DESERTS
Arid regions and wind erosion p 3780 N94-31005
Optical and image transmission through desert atmospheres
[AD-A276022] p 3742 N94-31496

DESIGN ANALYSIS
Chamber optics for testing passive remote sensing vapor detectors
[AD-A275909] p 3878 N94-31340
Analysis and synthesis of MOS translinear circuits
[ISBN-9-09-005495-2] p 3690 N94-31616
Design Methods based On Nets: DEMON
[PB94-147493] p 3813 N94-31687
Modular Simulator System (MSS) management guide
[AD-A277098] p 3588 N94-32014
A low-cost, CCD solid state star tracker
[NASA-CR-192722] p 3882 N94-32417
A PC program to optimize system configuration for desired reliability at minimum cost p 3823 N94-32438
The relationship between integrative task design for information systems professionals and perceived information systems effectiveness p 3919 N94-32487
Design and evaluation of coils for a 50 mm diameter induction coilgun launcher
[DE94-005244] p 3603 N94-32671
Detailed design of the 2MW Demonstration Plant
[DE94-000042] p 3762 N94-32823
Application of a design-build-team approach to low cost and weight composite fuselage structure
[NASA-CR-4418] p 3626 N94-32863
Analysis and design of a high speed, wide range stepwise tunable optical filter/amplifier
[PB94-149572] p 3698 N94-33169

DESORPTION
Experimental investigations and molecular dynamics simulations of radiation induced surface damage
[AD-A277323] p 3871 N94-32621

DESTABILIZATION
On wave interactions of rotational and irrotational flows p 3700 N94-31219

DESTRUCTION
Using Monte Carlo techniques and parallel processing for debris hazard analysis of rocket systems
[DE94-007250] p 3609 N94-31382

DETECTION
Proceedings of the 4th Tunnel Detection Symposium on Subsurface Exploration Technology
[AD-A276372] p 3771 N94-31369
Detection of a chi-square fluctuating target in Gaussian noise
[AD-A276078] p 3850 N94-31462
Perspectives of glucose sensing based on a charge-modulating competition reaction
[ISBN-9-09-005754-4] p 3795 N94-31652
Microwave sensor for ice detection p 3583 N94-32457
Visual processing of object velocity and acceleration
[AD-A277425] p 3801 N94-32998
Real-time sensor data validation
[NASA-CR-195295] p 3616 N94-33099

DETERIORATION
Evidence for a correct SiO2 voltage acceleration model
[DE94-006578] p 3690 N94-31594

DETONATION
Using Monte Carlo techniques and parallel processing for debris hazard analysis of rocket systems
[DE94-007250] p 3609 N94-31382

DETONATION WAVES
A study of near-surface and underwater explosions by computer simulations
[DE94-009038] p 3708 N94-32849

DETONATORS
Laser Diode Ignition (LDI)
[DE94-006590] p 3666 N94-31579

DEUTERIUM
Stark broadening of the 2S state of hydrogen and deuterium in arc plasmas of low density
[ETN-94-95731] p 3888 N94-31572
Modern integral equation techniques for quantum reactive scattering theory
[DE94-007039] p 3857 N94-31639
Dynamics of block poly(styrene-co-vinylpyridine) (SVP) in solution and on silica
[AD-A277139] p 3657 N94-32364
New polymer target-shell properties and characterizations
[DE94-008420] p 3890 N94-32415
Experimental survey of the L-H transition conditions in the D3-D tokamak
[DE94-007428] p 3891 N94-32595
Fusion with highly spin polarized HD and D2
[DE94-006209] p 3876 N94-32731
Deuterium absorption and material phase characteristics of SAES St198 Zr-Fe alloy
[DE94-006275] p 3646 N94-32781

DEW POINT
Coastal boundary layer and refractivity measurements using the ground-based high resolution interferometer sounder (GB-HIS)
[AD-A277980] p 3683 N94-33159

DIABETES MELLITUS
Perspectives of glucose sensing based on a charge-modulating competition reaction
[ISBN-9-09-005754-4] p 3795 N94-31652

DIAGNOSIS
Hierarchical fault catalog process for diagnosis of analog circuits
[ETN-94-95730] p 3689 N94-31571
Development of a video fluorescence system for assessing burn depth
[AD-A278127] p 3798 N94-33092

DIAMAGNETISM
Diamagnetism in helium Rydberg atoms
[ETN-94-96015] p 3865 N94-31549
Transport phenomena in the Earth's plasma sheet p 3772 N94-31970
Isothermal sintering, microstructure, and superconducting properties of Y1Ba2Cu3O(7-x) compound
[DE94-008132] p 3905 N94-32779

DIAMOND FILMS
Degenerate four-wave mixing as a diagnostic of plasma chemistry
[DE94-008588] p 3889 N94-31766
Materials processing and manufacturing technologies for diamond substrates multichip modules
[AD-A276904] p 3692 N94-32215
Ultrahigh-current-density metal-ion implantation and diamondlike-hydrocarbon films for tribological applications
[DE94-006958] p 3906 N94-32843

DIAMONDS
Deposition of DLC via intense ion beam ablation
[DE94-005583] p 3651 N94-31650
Materials processing and manufacturing technologies for diamond substrates multichip modules
[AD-A276904] p 3692 N94-32215
Heteroepitaxial diamond growth
[AD-A277178] p 3902 N94-32306
Compilation of diamond-like carbon properties for barriers and hard coatings
[DE94-008231] p 3661 N94-32803
Diamond turning in the production of x ray optics p 3604 N94-33298

DIAPHRAGMS (MECHANICS)
A silicon condenser microphone: Materials and technology
[ISBN-9-09-005899-0] p 3688 N94-31518
Development of high-pressure diaphragms for the AEDC impulse tunnel
[AD-A277053] p 3588 N94-32009

DIATOMIC GASES
Vibrational energy transfer of diatomic gases in hypersonic expanding flows p 3570 N94-31958

DIATOMIC MOLECULES
Implementation of a vibrationally linked chemical reaction model for DSMC
[NASA-TM-109109] p 3710 N94-33020

DICHROISM
Element-specific magnetic hysteresis measurements, a new application of circularly polarized soft x-rays
[DE94-007122] p 3858 N94-31397
Azo polymers for reversible optical storage. 4. Cooperative motion of rigid groups in semicrystalline polymers
[AD-A277107] p 3654 N94-31978
Dependence of x ray absorption magnetic circular dichroism on layer periodicity in iron-platinum multilayers
[DE94-008786] p 3647 N94-32892

DIELECTRIC POLARIZATION
Electrical properties of double layer dielectric structures for space technology
[ISBN-0-315-86547-4] p 3610 N94-31910

DIELECTRIC PROPERTIES
Microwave dielectric behavior of soils. Report 3: Measurement and modeling
[AD-A276060] p 3771 N94-31457
Satellite radar altimetry over the continental ice sheets p 3742 N94-31570

Passive vibration damping materials: Piezoelectric ceramic composites for vibration damping applications
[AD-A276550] p 3653 N94-31935
Electromagnetic probe technique for fluid flow measurements p 3711 N94-32455
Microwave sensor for ice detection
p 3583 N94-32457
Dielectric viscometer including fixed and variable cells
[AD-D016139] p 3639 N94-32973
Dielectric properties of Mars' surface: Proposed measurement on a Mars lander p 3951 N94-33237

DIELECTRICS
Sol-gel metal oxide and metal oxide/polymer multilayers applied by meniscus coating
[DE94-005813] p 3649 N94-31199
Structure estimation of phase objects from the diffraction near field: Microwave and model calculations
[ETN-94-95737] p 3674 N94-31608
Photonic bandgaps in periodic dielectric structures
[ISBN-0-315-86902-X] p 3899 N94-31729
A fracture mechanics methodology for characterizing the performance of flawed polymeric dielectric materials
p 3654 N94-31956
Photonic band gap materials
[DE94-005566] p 3677 N94-32101
Determination of BPSG thin-film properties using IR reflection spectroscopy of product wafers
[DE94-006591] p 3634 N94-32110
Chemical structure and kinetics at liquid/solid interfaces
[AD-A277112] p 3636 N94-32304

DIENES
Phase behavior, structure, and properties of model block polymers
[AD-A277530] p 3662 N94-32954

DIESEL ENGINES
Soot and liquid-phase fuel distributions in a newly designed optically accessible DI diesel engine
[DE94-005648] p 3723 N94-31651
Materials development program: Ceramic technology project bibliography, 1984-1992
[DE94-009297] p 3662 N94-32935

DIFFERENTIAL ABSORPTION LIDAR
Gyrotrons and free electron lasers for atmospheric sensing
[AD-A277281] p 3718 N94-32406

DIFFERENTIAL CALCULUS
First theory institute on computational differentiation
[DE94-006491] p 3841 N94-31309

DIFFERENTIAL EQUATIONS
Symplectic Runge-Kutta schemes 3: Canonical elementary differentials
[MATHS-REPT-A-204] p 3840 N94-31159
Symbolic derivation of Runge-Kutta methods
[MATHS-REPT-A-205] p 3840 N94-31160
Taming chaotic circuits p 3910 N94-31289
On wavelet representations of differential equations
[RR-482] p 3842 N94-31412
Numerical detection and continuation of codimension-two homoclinic bifurcations
[CWI-AM-R9308] p 3847 N94-32191
A stability estimate based on numerical ranges with application to a spectral discretization of a convection-diffusion equation
[TW-93-12] p 3847 N94-32200
On the error committed by stopping the Newton iteration in Runge-Kutta methods and linear multistep methods
[TW-93-13] p 3847 N94-32206
Preconditioned time-difference methods for advection-diffusion-reaction equations
[DE94-006472] p 3838 N94-32840
A study of weak solutions and their regularizations by numerical methods
[AD-A277453] p 3850 N94-33175

DIFFERENTIAL GEOMETRY
Some calculations on supersymmetric graphs as communication networks
[REPT-93-72] p 3824 N94-31641

DIFFERENTIAL INTERFEROMETRY
Evaluation of surface phase change on large zones
p 3755 N94-32567
Developments in ERS-1 SAR interferometry: Use of the spectral shift p 3756 N94-32569
Differential interferometry study of an earthquake
p 3756 N94-32570
Performance analysis of an integrated GPS/inertial attitude determination system
[NASA-CR-188289] p 3577 N94-32864

DIFFRACTION
Photoelectron diffraction and holography: Present status and future prospects
[DE94-006298] p 3712 N94-31629

DIFFRACTION PATTERNS
Photoelectron diffraction and holography: Present status and future prospects
[DE94-006298] p 3712 N94-31629
Ultra wide band radar holographic imaging of subsurface targets
[DE94-004271] p 3713 N94-32681

DIFFUSION
Defect-solute interactions near irradiation grain boundaries
[DE94-006215] p 3641 N94-31627
Generalized steady-state method for solving 2-D diffusion systems
[REPT-93-83] p 3825 N94-31700
Design of new polymers to improve radiation stability of plastic scintillators
[DE94-008220] p 3652 N94-31764
Numerical transport theory
[DE94-009064] p 3857 N94-32589
Fabrication, phase transformation studies and characterization of SiC-AlN-Al2OC ceramics
[DE94-008587] p 3659 N94-32657
Adjacent-cell Preconditioners for solving optically thick neutron transport problems
[DE94-007219] p 3872 N94-32666
Ab initio study of the epitaxial growth of Ge on Si(100) surface
[DE94-007245] p 3904 N94-32724
Anomalous transport equations in toroidal plasmas
[DE94-009206] p 3893 N94-32922
Numerical model of the thermal behavior of an extremity in a cold environment including counter-current heat exchange between the blood vessels
[AD-A276099] p 3798 N94-33040

DIFFUSION COEFFICIENT
Solvent diffusion coefficient concentration dependence in polymer solutions
[AD-A277023] p 3655 N94-32005
Particle diffusion from the beam-beam interaction in synchrotron colliders
[DE94-007111] p 3876 N94-32685

DIFFUSION FLAMES
NATO Advanced Study Institute on Unsteady Combustion. Volume 2: Research papers, September 6-17, 1993
[AD-A276572] p 3634 N94-32033

DIFFUSION THEORY
Numerical transport theory
[DE94-009064] p 3857 N94-32589

DIFFUSION WELDING
Joining of alumina by vacuum brazing
[VTT-TIED-1495] p 3724 N94-31656
Liquid-assisted diffusion bonding of NiAl
[DE94-008687] p 3645 N94-32522

DIFFUSIVITY
Notes on the Langevin model for turbulent diffusion of marked particles
[DE94-007847] p 3708 N94-32652
Experimental studies on the effect of coherency strains on coarsening kinetics: Current status and future outlook
[DE94-008480] p 3647 N94-32964

DIGITAL COMPUTERS
MDFF HELP library, version 2: On-line documentation for the map data formatting facility
[AD-A277763] p 3922 N94-32987
An experimental study of pilot/vehicle dynamics using a tilt rotor flying machine
[AD-A277516] p 3805 N94-33349

DIGITAL DATA
Entropy, information (and image), part 1
[TELECOM-93-D-009] p 3910 N94-31098
An intelligent interactive visual database management system for Space Shuttle closeout image management
p 3923 N94-32469
MDFF HELP library, version 2: On-line documentation for the map data formatting facility
[AD-A277763] p 3922 N94-32987

DIGITAL ELECTRONICS
Study of continuous-time and mixed analog-digital operators
[TELECOM-93-E-010] p 3687 N94-31170
VLSI for high-speed digital signal processing
[AD-A277617] p 3697 N94-32957
Superconducting and semiconducting hybrids and advance memory concepts for superconducting electronics
[AD-A277766] p 3907 N94-32988
A diagnostic expert system for digital circuits
p 3699 N94-33340

DIGITAL FILTERS
The generalized multi delay adaptive filter: Structure and convergence analysis
[TELECOM-93-D-004] p 3808 N94-31094
Concurrent architectures for VLSI signal and image processing
[AD-A276124] p 3688 N94-31445
Remote infrared vapor detection of volatile organic compounds
[AD-A276982] p 3746 N94-31999
Digital beamforming and filtering circuit
[AD-D016142] p 3697 N94-32976

DIGITAL RADAR SYSTEMS
Analysis of key performance parameters of phase sampling digital RF memories
[AD-A276019] p 3688 N94-31494

DIGITAL SIMULATION
Numerical method for the investigation of the magnetohydrodynamic stability of three dimensional plasma equilibria
[ETN-94-95752] p 3887 N94-31512
Real time simulation model for designing converter regulation
[ETN-94-95735] p 3689 N94-31576
Methods of implementing the Viterbi algorithm on a massively parallel computer of the SIMD (single instruction multiple data) type
[ISBN-0-315-86783-3] p 3814 N94-31752
An analog preprocessing architecture for high-speed analog-to-digital conversion
[AD-A276737] p 3807 N94-32163
Common modeling system for digital simulation
p 3823 N94-32429

DIGITAL SYSTEMS
Fault coverage measurement for digital microcircuits
[AD-A276226] p 3686 N94-31066
A generic model for data acquisition: Connectionist methods of information processing
[TELECOM-93-E-003] p 3730 N94-31166
Concurrent architectures for VLSI signal and image processing
[AD-A276124] p 3688 N94-31445
The trustworthy digital camera: Restoring credibility to the photographic image p 3714 N94-32470
Digital image profilers for detecting faint sources which have bright companions
[NASA-CR-191348] p 3927 N94-32695
MDFF HELP library, version 2: On-line documentation for the map data formatting facility
[AD-A277763] p 3922 N94-32987
Advanced silicon technology for microwave circuits
[AD-A278039] p 3698 N94-33091

DIGITAL TECHNIQUES
A direct digital design for a multichannel structural test system using the characteristic locus method
[MATHS-REPT-A-206] p 3828 N94-31161
A Hyland-Bernstein approach to the digital control of Pritchard-Salamon systems
[REPT-93-76] p 3844 N94-31693
Alternatives to hierarchical techniques in stereo correlation
[AD-A276570] p 3746 N94-31938
Example of SPOT/ERS-1 complementarity
p 3749 N94-32533
Study of subpolar glaciers of Spitzbergen using SPOT, ERS-1, and hypsometric data: Results and perspectives
p 3753 N94-32553
Comparing SPOT and SIR A for mapping superficial formations in tropical forest regions: Example of the Yaoundy Region (Cameroon) p 3755 N94-32562
Precision and level of artefacts in the computation of digital terrain models by interferometry
p 3756 N94-32571
Fields of experiments in ERS-1 SAR interferometry in Bonn and Naples p 3756 N94-32572

DIMENSIONAL MEASUREMENT
Apron heights around stepped massifs in the Cydonia Mensae region: Do they record the local paleobathymetry of Oceanus Borealis? p 3949 N94-33224

DIMERS
Ab initio study of the epitaxial growth of Ge on Si(100) surface
[DE94-007245] p 3904 N94-32724
Possible effect of the chlorine oxide dimer on transient ozone loss in rocket plumes
[AD-A278135] p 3616 N94-33094

DIODES
Theoretical studies on ionospheric irregularities and ion diode performance
[AD-A277115] p 3772 N94-31984
X ray pulse considerations and electron flow in high voltage diodes
[AD-A277301] p 3868 N94-32044
Time resolved measurements of light produced by onset of plasma formation on electrodes of fast pulsed high voltage diodes
[AD-A277974] p 3894 N94-33264

DIPOLE ANTENNAS
Predicting antenna parameters from antenna physical dimensions
[AD-A276442] p 3672 N94-31300

DIRECT CURRENT
Modal analysis of multiterminal high voltage direct current transmission
[DE94-006426] p 3691 N94-31785

DIRECTIONAL ANTENNAS
Low sidelobe reflector antenna design for communications
[AD-A276079] p 3673 N94-31463
DIRECTIONAL SOLIDIFICATION (CRYSTALS)
An experimental study of void formation during aluminum solidification in reduced gravity p 3667 N94-31944
DIRECTIONAL STABILITY
Controls design with crossfeeds for hovering rotorcraft using quantitative feedback theory
[NASA-CR-195765] p 3585 N94-31203
DIRECTIVITY
Experimental and computational studies on propeller noise due to inflow distortion p 3860 N94-31846
DIRICHLET PROBLEM
Finite volume discretization of the k-epsilon turbulence model in general coordinates
[REPT-93-90] p 3703 N94-31703
DISASTERS
Feasibility in the use of satellite remote sensing data as a fast reaction tool for natural disaster relief p 3748 N94-32526
DISCONNECT DEVICES
Design and performance of the telescope and detector covers on the Extreme Ultraviolet Explorer satellite p 3605 N94-33309
Payload holddown and release mechanism p 3607 N94-33321
Advanced release technologies program p 3607 N94-33322
DISCRETE COSINE TRANSFORM
A visual detection model for DCT coefficient quantization p 3850 N94-32467
COVICS: A covert video communications system
[DE94-007568] p 3682 N94-32745
DISCRIMINANT ANALYSIS (STATISTICS)
A differential theory of learning for efficient statistical pattern recognition
[AD-A277313] p 3800 N94-32277
DISEASES
Muscle disuse through tail-suspension: Etiology and therapeutics p 3796 N94-31746
DISK GALAXIES
Three-dimensional radiative transfer calculations on an SIMD machine applied to accretion disks p 3932 N94-31141
The stellar and gaseous content of massive low surface brightness disk galaxies p 3933 N94-31495
DISK OPERATING SYSTEM (DOS)
An MS-DOS file system for UNIX
[AD-A276523] p 3816 N94-32081
DISLOCATIONS (MATERIALS)
Engineering of damage in ion implanted silicon
[ISBN-9-09-005097-3] p 3897 N94-31521
DISPERSING
Analysis of strong acoustic excitation on the breakup and dispersion of a liquid jet
[ONERA-NT-1993-9] p 3701 N94-31422
DISPERSION STRENGTHENING
Processing of novel nanoparticle dispersion strengthened ceramics for improved mechanical performance
[AD-A275965] p 3649 N94-31276
DISPLACEMENT
An efficient higher order theory for laminated composite plates and a finite element implementation p 3617 N94-31215
Electron energy dependence of amorphization in Zr3Fe
[DE94-008459] p 3906 N94-32875
DISPLAY DEVICES
Active matrix liquid crystal display. Industry survey results
[AD-A276415] p 3895 N94-31329
Theoretical basis for state vector comparison, relative position display, and relative position/rendezvous prediction
[AD-A277216] p 3608 N94-32020
PSIDD: A Post-Scan Interactive Data Display system for ultrasonic scans
[NASA-TM-4545] p 3732 N94-33038
Three dimensional audio versus head down TCAS displays
[NASA-CR-177636] p 3576 N94-33063
Cockpit Electronic Display Workshop: Proceedings (computer diskette)
[AD-M000330] p 3805 N94-33171
Cockpit Electronic Display Workshop: A synopsis
[AD-A277728] p 3583 N94-33280
An experimental study of pilot/vehicle dynamics using a tilt rotor flying machine
[AD-A277516] p 3805 N94-33349
DISSOLVING
Characterization of the corrosion resistance of duplex stainless steels using local current density mapping techniques
[DE94-007980] p 3646 N94-32699
DISTANCE
Measuring the Hubble constant and our Virgo-infall velocity independently p 3926 N94-31968
DISTORTION
Bounds on least-squares four-parameter sine-fit errors due to harmonic distortion and noise
[DE94-007859] p 3849 N94-32653
DISTRIBUTED PARAMETER SYSTEMS
Invariance of the generalized steady-state for 1-D distributed parameter systems
[REPT-93-66] p 3825 N94-31662
Generalized steady-state method for solving 2-D diffusion systems
[REPT-93-83] p 3825 N94-31700
Approximation theory and computational methods for the identification and control of distributed parameter systems
[AD-A277335] p 3848 N94-32244
Control and stabilization of distributed parameter systems; theoretical and computational aspects
[AD-A277239] p 3738 N94-32275
DISTRIBUTED PROCESSING
Using atomic actions in replica groups to simplify the replication implementation
[REPT-93-78] p 3813 N94-31695
A theory of distributed time
[AD-A276631] p 3815 N94-31994
CMS Distribution Subsystem user's guide
[DE94-005328] p 3816 N94-32146
Parallel and distributed computing combinatorial algorithms
[AD-A277333] p 3826 N94-32243
Communication networks for autonomous mobile robot computer architectures and distributed real-time computing p 3680 N94-32310
Modular Simulator System (MSS). Engineering design guide
[AD-A276967] p 3589 N94-32394
Modular Simulator System (MSS): Interface design document for the generic MSS
[AD-A277270] p 3590 N94-32403
Spacecraft On-Board Information Extraction Computer (SOBIEC) p 3808 N94-32433
A high-speed linear algebra library with automatic parallelism p 3828 N94-32440
High performance real-time flight simulation at NASA Langley p 3591 N94-32473
A software architecture for multidisciplinary applications: Integrating task and data parallelism
[NASA-CR-194896] p 3820 N94-32928
DISTRIBUTION FUNCTIONS
The kinematics of dense clusters of galaxies p 3937 N94-32029
On constructing multi-variate orthonormal polynomials associated with spectral distribution functions
[CWI-BS-R9310] p 3851 N94-32225
On the minimum of independent geometrically distributed random variables
[NASA-CR-194883] p 3821 N94-33075
DISULFIDES
Proceedings of the Ad Hoc Workshop on Ceramics for Li/FeS2 batteries
[DE94-007460] p 3694 N94-32607
The relative performance of FeS2 and CoS in long-life thermal-battery applications
[DE94-006145] p 3695 N94-32663
DITCHING (LANDING)
Rotorcraft ditchings and water-related impacts that occurred from 1982 - 1989, phase 2
[AD-A276473] p 3574 N94-31246
DIURNAL VARIATIONS
Evolution of diurnal surface winds and surface currents for Monterey Bay
[AD-A277649] p 3790 N94-33057
The influence of thermal inertia on Mars' seasonal pressure variation and the effect of the weather component p 3952 N94-33238
Diurnal, seasonal and solar activity variations of F-region parameters
[AD-A278106] p 3776 N94-33285
DIVERTERS
First-wall heat-flux measurements during ELMing H-mode plasma
[DE94-008310] p 3888 N94-31765
Overview of H-mode studies in D3-D
[DE94-007430] p 3891 N94-32612
Divertor pumping and other reactor application issues for H-mode
[DE94-007431] p 3892 N94-32810
Cooperative program on D3-D (FY 1993)
[DE94-008343] p 3892 N94-32820
DIVING (UNDERWATER)
Proceedings of the DCIEM Diver Thermal Protection Workshop
[DCIEM-92-10] p 3795 N94-31738
Effects of combined breathing impediments on diver's respiratory performance
[AD-A277437] p 3805 N94-33084
DOCUMENTATION
A hypertext system that learns from user feedback p 3923 N94-32428
DONOR MATERIALS
Recent developments in polymeric charge transfer complexes
[AD-A277108] p 3654 N94-31979
DOPED CRYSTALS
Growth and characterization of III-V semiconductors with rare earth impurities for optoelectronic devices
[AD-A276021] p 3896 N94-31455
Novel electroactive polymers and block copolymers
[AD-A276119] p 3650 N94-31509
Processing boron and boron carbide thin films for protective coatings and device fabrication
[AD-A277266] p 3900 N94-32041
Oriented Si and Ge nanocrystals formed in Al2O3 by ion implantation and annealing
[DE94-005593] p 3901 N94-32172
Conductivity measurements of ceria-based solid electrolytes using AC impedance
[DE94-007380] p 3694 N94-32593
Boron and hydrogen in Ni3Al. Part 2: Mechanical testing of bicrystals
[DE94-007441] p 3904 N94-32606
Characterization of thermally stable dye-doped polyimide based electrooptic materials
[DE94-005309] p 3882 N94-32674
Properties of doped and undoped (Ca,Sr)CuO2 thin films
[DE94-007230] p 3905 N94-32785
Characterization of crosslinked electrooptic polyimides
[DE94-007934] p 3661 N94-32819
Investigation of superconductivity and magnetism in d and f-electron materials
[DE94-008535] p 3907 N94-32933
Optical properties of lanthanide-doped RbTiOAsO4 and transition metal-doped KTiOPO4
[DE94-008433] p 3907 N94-32963
A relaxation study of poled nonlinear optical polymers by infrared reflection-absorption spectroscopy
[AD-A277513] p 3663 N94-33054
Rare Earth Doped Semiconductors and Materials Research Society Symposium Proceedings, Volume 301
[AD-A277517] p 3908 N94-33055
Development of materials for spectral hole burning applications
[AD-A278408] p 3909 N94-33324
DOPPLER RADAR
Radar measurements p 3685 N94-31002
DOSIMETERS
Investigation of scintillator and fibre light in plastic scintillation dosimetry
[ISBN-0-315-87190-3] p 3879 N94-31877
System for monitoring and analyzing field energy exposure
[AD-D016115] p 3681 N94-32625
Complete model description of an electron beam using ACCEPT Monte Carlo simulation code
[DE94-007063] p 3872 N94-32628
DOWNLINKING
Data processing algorithms for on-board satellite event analysis
[AD-A278406] p 3838 N94-33168
DOWNRANGE
Phase-only correction of scintillated laser beams: Downrange experimental results
[AD-A277778] p 3722 N94-33282
DRAG COEFFICIENTS
A critical assessment of UH-60 main rotor blade airfoil data
[NASA-TM-103985] p 3571 N94-32063
DRAG MEASUREMENT
Aerodynamic drag of droplets in turbulent flow fields
[ISBN-0-315-75827-9] p 3571 N94-32491
DRAG REDUCTION
Computational study of single-expansion-ramp nozzles with external burning
[NASA-TM-106550] p 3700 N94-31229
Shock-dependent, optimum thrust wings in supersonic flow p 3570 N94-32027
DRAINAGE PATTERNS
Respective contributions of VIS-PIR, SAR-ERS 1, and airborne radar data for morphostructural and morphoneotectonic analysis: Practical examples p 3752 N94-32549

DREDGING
Results of real-time testing and demonstration of the US Army Corps of Engineers real-time on-the-fly positioning system
[AD-A276160] p 3576 N94-31080
DROP SIZE
Solidification structure synthesis in undercooled liquids
[AD-A276166] p 3910 N94-31054
Cloud studies seen from a physical chemist's perspective
[DE94-006059] p 3771 N94-31527
Drop size distributions and related properties of fog for five locations measured from aircraft
[NASA-CR-4585] p 3787 N94-33065
DROPS (LIQUIDS)
Solidification structure synthesis in undercooled liquids
[AD-A276166] p 3910 N94-31054
Single scattering of light by ensembles of particles with various shapes
[ETN-94-96016] p 3878 N94-31550
Thermocapillary convection in evaporating sessile drops
[NASA-TM-109758] p 3705 N94-31886
A parameterization of cloud droplet nucleation
[DE94-007469] p 3785 N94-32268
Aerodynamic drag of droplets in turbulent flow fields
[ISBN-0-315-75827-9] p 3571 N94-32491
DROUGHT
Some aspects of the drought in North Africa and in the Mediterranean basin p 3778 N94-30989
DRUGS
Drug-related problems in the workplace
[CRANFIELD-AERO-9306] p 3914 N94-31538
DRY FRICTION
A Gauss-Seidel type solver for special convex programs, with application to frictional contact mechanics
[REPT-93-77] p 3813 N94-31694
DRYING
Thermocapillary convection in evaporating sessile drops
[NASA-TM-109758] p 3705 N94-31886
Conductive paints
[DE94-008508] p 3661 N94-32788
Dry deposition of PAN to grassland vegetation
[DE94-005111] p 3768 N94-32894
Physics of heat pipe rewetting
[NASA-CR-195902] p 3913 N94-33148
DRYING APPARATUS
Novel ultrasonic method for food hydration
[AD-A277411] p 3804 N94-32580
DUCTILITY
High temperature ductility loss in titanium alloys: A review
[DE94-006606] p 3640 N94-31345
DURABILITY
Space environment durability of beta cloth in LDEF thermal blankets p 3591 N94-31015
Molecular interactions at metal/polyimide interfaces: A correlation with adhesion and bond durability
[AD-A276301] p 3650 N94-31297
Surface chemistry and durability of borosilicate glass
[DE94-006734] p 3656 N94-32116
Development of stitched/RTM composite primary structures p 3628 N94-33127
Resin transfer molding for advanced composite primary wing and fuselage structures p 3628 N94-33128
DUST
Mars atmospheric dust properties: A synthesis of Mariner 9, Viking, and Phobos observations p 3945 N94-33200
Groundbased monitoring of Martian atmospheric opacity p 3947 N94-33207
Temporal and spatial mapping of atmospheric dust opacity and surface albedo on Mars p 3947 N94-33211
Studies of atmospheric dust from Viking IR thermal mapper data p 3948 N94-33216
The wavelength dependence of Martian atmospheric dust radiative properties p 3950 N94-33228
DUST STORMS
Desert aerosols: Sources, transports, and impacts determined by remote sensing p 3770 N94-31003
Arid regions and wind erosion p 3780 N94-31005
Might it be possible to predict the onset of major Martian dust storms? p 3948 N94-33215
DWARF STARS
Reactive flows in compact objects p 3934 N94-31567
A chemical analysis of solar neighborhood dwarfs p 3926 N94-31951
DYES
Mechanisms of laser induced reactions in opaque heterogeneous environments
[AD-A276642] p 3717 N94-31996
Characterization of thermally stable dye-doped polyimide based electrooptic materials
[DE94-005309] p 3882 N94-32674
Characterization of crosslinked electrooptic polyimides
[DE94-007934] p 3661 N94-32819
A relaxation study of poled nonlinear optical poimers by infrared reflection-absorption spectroscopy
[AD-A277513] p 3663 N94-33054
Development of a video fluorescence system for assessing burn depth
[AD-A278127] p 3798 N94-33092
DYNAMIC CHARACTERISTICS
Model updating of vibrating systems based on measured or calculated frequency response functions
[CTH-E-93-03] p 3732 N94-31091
Vibration control and design of composite cantilevers taking into account structural uncertainties and damage p 3733 N94-31213
Asymptotic behavior of dynamic systems p 3911 N94-31894
Structural stability and bifurcations p 3911 N94-31895
Seasons and chaos in population dynamics p 3912 N94-31897
Dynamics of block poly(styrene-co-vinylpyridine) (SVP) in solution and on silica
[AD-A277139] p 3657 N94-32364
Quantum dynamics in dual spaces
[DE94-008303] p 3913 N94-32824
DYNAMIC CONTROL
Real-time control of the Trussarm variable-geometry-truss manipulator utilizing machine vision
[ISBN-0-315-87054-0] p 3830 N94-31735
Study of a path planning and tracking system for an articulated mobile robot
[ISBN-0-315-86502-4] p 3831 N94-31800
A real-time computer control and trajectory generation environment for Trussarm
[ISBN-0-315-87060-5] p 3832 N94-31833
Real-time control and application to robotics: Hardware and software architectures
[ISBN-0-315-87192-X] p 3833 N94-31876
Control of a flexible-link robotic arm manipulating an unknown dynamic payload p 3725 N94-31973
Dynamics and control of orbiting flexible systems: A formulation with applications
[ISBN-0-315-75390-0] p 3611 N94-32502
Design, characterization and control of the Unique Mobility Corporation robot p 3603 N94-33296
DYNAMIC LOADS
Deformation and rupture of cylindrical shells under dynamic loading p 3733 N94-31288
Limiting vibration in systems with constant amplitude actuators through command preshaping
[NASA-CR-188284] p 3739 N94-32907
Intelligent control of a multi-degree-of freedom reaction compensating platform system using fuzzy logic p 3605 N94-33306
DYNAMIC MODELS
Application of contact mechanics for the validation of robotized operations of grasping objects subjected to static and dynamic force fields
[ISBN-0-315-86831-7] p 3725 N94-31754
On the reciprocal relationship between life histories and population dynamics
[CWI-AM-R9302] p 3793 N94-32226
Six degree of freedom flight dynamic model of a Mk-82 store
[AD-A277065] p 3580 N94-32362
String-parton model description of relativistic heavy-ion collisions
[DE94-009164] p 3874 N94-32850
DYNAMIC PRESSURE
Research in marine boundary layer intermittency
[AD-A276076] p 3701 N94-31460
DYNAMIC PROGRAMMING
Exact solution of the single machine scheduling problem with earliness and flow time penalties
[REPT-93-038] p 3809 N94-31189
What comes first in dynamic semantics: A compositional, non-representational account of natural language presupposition
[LP-93-15] p 3855 N94-31389
Performability modelling using DyQNtool+
[MEMO-INF-93-45] p 3812 N94-31659
CAD-based off-line planning for an active-vision system
[ISBN-0-315-86317-X] p 3813 N94-31713
On the convergence of stochastic iterative dynamic programming
[AD-A276517] p 3815 N94-31933
DOME: Dynamic optimization on multiprocessor engines, a statistical approach p 3807 N94-31972
DYNAMIC RANGE
Advanced optical fiber communication systems
[AD-A276416] p 3878 N94-31330
DYNAMIC RESPONSE
Model updating of vibrating systems based on measured or calculated frequency response functions
[CTH-E-93-03] p 3732 N94-31091
Controls design with crossfeeds for hovering rotorcraft using quantitative feedback theory
[NASA-CR-195765] p 3585 N94-31203
Deformation and rupture of cylindrical shells under dynamic loading p 3733 N94-31288
A study of the Space Station Freedom response to the disturbance environment p 3600 N94-31434
Chaotic attitude motion of satellites in the central gravitational field
[ISBN-0-315-78768-6] p 3610 N94-31723
Heave dynamics of an air cushion vehicle bag and finger skirt
[ISBN-0-315-87053-2] p 3568 N94-31734
Vibrational and acoustic response of ribbed plates p 3736 N94-31955
A separation technique for asymptotic-numeric solution for general shells of revolution p 3736 N94-31961
Reciprocity-based experimental determination of dynamic forces and moments: A feasibility study
[NASA-CR-194905] p 3862 N94-33023
Response of a cantilevered plate in supersonic flow
[AD-A277487] p 3580 N94-33107
DYNAMIC STABILITY
Structural stability and bifurcations p 3911 N94-31895
DYNAMIC STRUCTURAL ANALYSIS
A study of the Space Station Freedom response to the disturbance environment p 3600 N94-31434
Study of wave propagation and dynamic response of laminated composite structures
[AD-A276123] p 3619 N94-31444
Fluid-structure interaction in case of water hammer with cavitation
[PB94-148277] p 3702 N94-31588
Random vibrations of composite beams and plates p 3735 N94-31777
Futurepath 3
[NASA-TM-109762] p 3735 N94-31819
Vibrational and acoustic response of ribbed plates p 3736 N94-31955
Vibration localization in dual-span axially moving elastic systems p 3736 N94-31964
Nonlinear vibration analysis of laminated plates on linear and nonlinear elastic foundations p 3737 N94-32079
Control and stabilization of distributed parameter systems; theoretical and computational aspects
[AD-A277239] p 3738 N94-32275
Multiple size scale structures in silica/siloxane composites studied by small-angle scattering
[DE94-007300] p 3625 N94-32642
Structural damping studies at cryogenic temperatures
[NASA-TM-109073] p 3740 N94-33118
DYNAMICAL SYSTEMS
On wavelet representations of differential equations
[RR-482] p 3842 N94-31412
Bifurcation and deterministic chaos in dynamic systems
[REPT-93-047] p 3911 N94-31893
Asymptotic behavior of dynamic systems p 3911 N94-31894
Structural stability and bifurcations p 3911 N94-31895
Deterministic chaos p 3912 N94-31896
DYNAMO THEORY
Evolution of dynamo-generated magnetic fields in accretion disks around compact and young stars p 3931 N94-31138
Steps toward understanding the solar dynamo
[AD-A277398] p 3953 N94-32343

E

E REGION
Performance statistics bulletin. High latitude meteor scatter propagation February, March, April, May 1991
[AD-A276723] p 3678 N94-32158
Performance statistics bulletin. High latitude meteor scatter propagation October, November, December 1991, January 1992
[AD-A276724] p 3678 N94-32159
Performance statistics bulletin. High latitude meteor scatter propagation
[AD-A276694] p 3680 N94-32298
Performance statistics bulletin. High latitude meteor scatter propagation
[AD-A276695] p 3680 N94-32299

Performance statistics bulletin. High latitude meteor scatter propagation
[AD-A276696] p 3680 N94-32300
Performance statistics bulletin. High latitude meteor scatter propagation, June, July, August, September 1992
[AD-A277508] p 3685 N94-33347

EARLY WARNING SYSTEMS
Vulnerability assessment of a space based weapon platform electronic system exposed to a thermonuclear weapon detonation
[DE94-007229] p 3611 N94-32667

EARTH ALBEDO
The surface parameters: Remote sensing observations and climatology applications p 3779 N94-31001

EARTH ATMOSPHERE
Wind-speed measurements with a scanning elastic-backscatter lidar
[DE94-004974] p 3785 N94-32726

EARTH CORE
Magnetohydrodynamics of the Earth's core. 1: Steady, rotating magnetoconvection. 2: Magnetic Rossby waves p 3770 N94-31104

EARTH IONOSPHERE
Theory, Image Simulation, and Data Analysis of Chemical Release Experiments
[NASA-CR-194865] p 3954 N94-31101
Analysis of ionospheric parameters in Europe and creation of the prediction algorithm
[AD-A276342] p 3771 N94-31326
The High-Frequency Benchmark propagation program
[AD-A276323] p 3672 N94-31334
Theoretical studies on ionospheric irregularities and ion diode performance
[AD-A277115] p 3772 N94-31984
An analysis of ionospheric dayglow from observations of the Naval Postgraduate School Middle Ultraviolet Spectrograph (MUSTANG)
[AD-A277351] p 3773 N94-32335
Spatial correlation of ionospheric variability
[AD-A278105] p 3776 N94-33041
Ionospheric plasma outflow in response to transverse ion heating: Self-consistent macroscopic treatment
[NASA-CR-195820] p 3893 N94-33048
Participation in the scientific activities of the Waves in Space Plasma (WISP) project
[NASA-CR-195903] p 3894 N94-33113
Millstone Hill radar studies of plasma waves and turbulence
[AD-A278409] p 3684 N94-33172
EUROCAP program
[AD-A278084] p 3776 N94-33184

EARTH MAGNETOSPHERE
Theory, Image Simulation, and Data Analysis of Chemical Release Experiments
[NASA-CR-194865] p 3954 N94-31101
Computer modeling of active experiments in space plasmas p 3890 N94-31927
Analysis of data from the plasma composition experiment on the International Sun-Earth Explorer (ISEE 1)
[NASA-CR-195880] p 3893 N94-33074
Characteristics of ion flow in the quiet state of the inner plasma sheet
[AD-A277451] p 3894 N94-33106
Participation in the scientific activities of the Waves in Space Plasma (WISP) project
[NASA-CR-195903] p 3894 N94-33113

EARTH MANTLE
Magnetohydrodynamics of the Earth's core. 1: Steady, rotating magnetoconvection. 2: Magnetic Rossby waves p 3770 N94-31104

EARTH MOVEMENTS
SAR interferometry with ERS-1 p 3755 N94-32566
Differential interferometry study of an earthquake p 3756 N94-32570
Procedures for computing site seismicity
[AD-A277666] p 3775 N94-33028

EARTH OBSERVATIONS (FROM SPACE)
The processing technology and some applications of Almaz-1 data p 3756 N94-32573
Earth observational research using multistage EOS-like data
[NASA-CR-195833] p 3757 N94-33019

EARTH OBSERVING SYSTEM (EOS)
Global change research and NASA's Earth Observing System
[PB94-126992] p 3741 N94-31068
MODIS. Volume 1: MODIS level 1A software baseline requirements
[NASA-TM-104594-VOL-1] p 3823 N94-33287
MODIS. Volume 2: MODIS level 1 geolocation, characterization and calibration algorithm theoretical basis document, version 1
[NASA-TM-104594-VOL-2] p 3613 N94-33289

EARTH ORBITAL ENVIRONMENTS
The performance of thermal control coatings on LDEF and implications to future spacecraft p 3591 N94-31013
Performance of silvered Teflon (trademark) thermal control blankets on spacecraft p 3591 N94-31014
Space Station WP-2 application of LDEF MLI results p 3592 N94-31016
Anodized aluminum on LDEF p 3592 N94-31017
Follow-up on the effects of the space environment on UHCRE thermal blankets p 3592 N94-31018
Modeling of LDEF contamination environment p 3592 N94-31019
Model of spacecraft atomic oxygen and solar exposure microenvironments p 3593 N94-31021
Atomic oxygen erosion considerations for spacecraft materials selection p 3593 N94-31022
Performance of selected polymeric materials on LDEF p 3593 N94-31023
Atomic oxygen interaction at defect sights in protective coatings on polymers flown on LDEF p 3593 N94-31024
Fluorescence observations of LDEF exposed materials as an indicator of induced material reactions p 3593 N94-31025
Laser-induced fluorescence of space-exposed polyurethane p 3593 N94-31026
On the linearity of fast atomic oxygen effects p 3594 N94-31027
Low-Earth orbit effects on organic composite materials flown on LDEF p 3595 N94-31036
Summary of materials and hardware performance on LDEF p 3595 N94-31037
Ground-based simulation of LEO environment: Investigations of a select LDEF material: FEP Teflon (trademark) p 3596 N94-31039
An overview of the Evaluation of Oxygen Interaction with Materials-third phase (EOIM-3) experiment: Space Shuttle Mission 46 p 3596 N94-31040
Preliminary results from the CONCAP-2-01 and EIOM-3 experiments on STS-46 p 3596 N94-31042
Effects of orbital exposure on RTV during the LDEF mission p 3597 N94-31043
Spacecraft materials: Comparison between flight results obtained on LDEF and MIR p 3597 N94-31045
Design application and development of spacecraft in LEO utilizing LDEF results p 3597 N94-31047
An overview of the on-orbit contamination of the Long Duration Exposure Facility (LDEF) p 3598 N94-31049
What LDEF means for development and testing of materials p 3598 N94-31050
Space hypervelocity microparticle impact damage in polymer matrix composites
[ISBN-0-315-87057-5] p 3652 N94-31692
Combined contamination and space environmental effects on solar cells and thermal control surfaces
[NASA-TM-106592] p 3617 N94-33022

EARTH ORBITS
Semianalytic Satellite Theory (SST): Mathematical algorithms
[AD-A276836] p 3610 N94-32208
Combined contamination and space environmental effects on solar cells and thermal control surfaces
[NASA-TM-106592] p 3617 N94-33022

EARTH RADIATION BUDGET EXPERIMENT
NOAA-9 Earth Radiation Budget Experiment (ERBE) scanner offsets determination
[NASA-TM-109086] p 3785 N94-32737

EARTH RESOURCES
European Imaging Spectroscopy Aircraft Campaign
[ESA-SP-360] p 3743 N94-31853
The European Imaging Spectroscopy Airborne Campaign (EISAC). Data takes and evaluation programme: An overview p 3743 N94-31854

EARTH SURFACE
The surface parameters: Remote sensing observations and climatology applications p 3779 N94-31001
Homogeneous global mean temperature time series
[DE94-002194] p 3766 N94-32690
Parameterizing atmosphere-land surface exchange for climate models with satellite data: A case study for the Southern Great Plains CART site
[DE94-005109] p 3775 N94-32874

EARTH TERMINALS
Satellite communications industry
[AD-A276685] p 3610 N94-32039

EARTHQUAKES
Differential interferometry study of an earthquake p 3756 N94-32570
Procedures for computing site seismicity
[AD-A277666] p 3775 N94-33028

ECCENTRICITY
Testing for preferred-frame effects in gravity with artificial Earth satellites
[PB94-148459] p 3610 N94-31771

ECHO SOUNDING
Multi-scale studies of seafloor topography
[AD-A277008] p 3789 N94-32400

ECOLOGY
Behavior and dynamics of tropical forests and savannas p 3757 N94-31004
Proceedings of a Joint US-Japan Seminar in the Environmental Sciences
[DE94-004727] p 3741 N94-31606

ECONOMIC ANALYSIS
Economic analysis of the hertzian spectrum
[TELECOM-93-E-012] p 3670 N94-31171
Economic feasibility analysis of distributed electric power generation based upon the natural gas fired fuel cell
[DE94-005795] p 3759 N94-31487
Feasibility study for the recycling of nickel metal hydride electric vehicle batteries
[DE94-000268] p 3690 N94-31598
Scenarios for multi-unit inertial fusion energy plants producing hydrogen fuel
[DE94-006614] p 3666 N94-32114
Estimating the impact of crashworthiness standards on mortality and morbidity events in the US Army rotary-wing aircraft mishaps
[AD-A277121] p 3575 N94-32363
Recovery of carboxylic acids at pH greater than pKa
[DE94-007030] p 3636 N94-32376

ECONOMIC FACTORS
Using the National Information Infrastructure for social science, education, and informed decision making
[DE94-005442] p 3920 N94-32676
Optimal planning of residential photovoltaic systems under various rate structure
[DE94-757272] p 3762 N94-32919
FAA aviation forecasts, fiscal years 1994-2005
[AD-A277808] p 3566 N94-33016

ECONOMICS
The contribution of aeronautics and astronautics to the quality of life on Earth
[ILR-MITT-283(1993)] p 3764 N94-31611
Strategies for survival in the new environmental era
[AD-A276827] p 3765 N94-32195
Solar activities at Sandia National Laboratories
[DE94-007737] p 3761 N94-32648
Environmental issues related to biomass: An overview
[DE94-007226] p 3767 N94-32784

ECOSYSTEMS
Behavior and dynamics of tropical forests and savannas p 3757 N94-31004
Proceedings of a Joint US-Japan Seminar in the Environmental Sciences
[DE94-004727] p 3741 N94-31606

EDDY CURRENTS
Continuous measurement of aging response in aluminum alloys by eddy current methods
[AD-A277233] p 3644 N94-32371
A versatile nondestructive evaluation imaging workstation p 3732 N94-32458
Surface conforming flexible eddy current probe for scanning varying surface contours
[AD-D016173] p 3627 N94-33018

EDGE DETECTION
Automated detection of ship tracks in multispectral satellite data
[AD-A276697] p 3746 N94-32119

EDITING ROUTINES (COMPUTERS)
Emacs Lisp in Edwin scheme
[AD-A276721] p 3818 N94-32504

EDUCATION
European business confronted with the 21st century: Men, the essential risk
[ESA-SP-1167] p 3914 N94-31181
Satellite direct readout: Opportunities for science education
[AD-A276257] p 3609 N94-31292
An innovative approach to space education p 3600 N94-31436
ISU in an era of partial reconvergence — International Space University p 3600 N94-31438
Solar physics and terrestrial effects. A curriculum guide for teachers, grade 7-12
[PB94-142247] p 3953 N94-31595
Practical neutron training course: Course notes
[PB94-145158] p 3867 N94-31681
Marsville: The cosmic village
[NASA-TM-109752] p 3913 N94-31806
NASA report to education, volume 9
[NASA-TM-109760] p 3913 N94-31817
Defying gravity
[NASA-TM-109747] p 3667 N94-31884
The sky is your classroom
[NASA-TM-109759] p 3914 N94-31887
Recommendations for meteorological data collection during physiological field studies
[AD-A276834] p 3901 N94-32153

X ray optics for science and technology
[AD-A277369] p 3880 N94-32155
A systems approach to computer-based training
p 3823 N94-32436
Literacity: A multimedia adult literacy package combining NASA technology, recursive ID theory, and authentic instruction theory p 3924 N94-32462
Virtual reality in medical education and assessment
p 3798 N94-32471
Using the National Information Infrastructure for social science, education, and informed decision making
[DE94-005442] p 3920 N94-32676
A facilitated mentoring process for engineers
[DE94-005823] p 3914 N94-32677
Multimedia as a desktop and classroom tool
[DE94-009116] p 3807 N94-32766
On the use of computers for teaching fluid mechanics
[NASA-TM-106587] p 3820 N94-32773
OPTIONS for systemic change in mathematics, science, and technology education: Scientist/teacher partnerships
[DE94-007472] p 3914 N94-32910
An exploratory study of neuro linguistic programming and communication anxiety
[AD-A277756] p 3682 N94-32986
Ada support for the mathematical foundations of software engineering
[AD-A278031] p 3822 N94-33284

EFFICIENCY
Design patterns mixing genericity and inheritance in the development of reusable components
[REPT-93-021] p 3808 N94-31178

EFFLUENTS
Time-dependent behavior of Mount Pinatubo aerosol
[DE94-001877] p 3764 N94-31601
Concentration system performance degradation in the aftermath of Mount Pinatubo
[DE94-001879] p 3764 N94-31602

EIGENVALUES
Arnoldi code for computing selected eigenvalues of sparse real unsymmetric matrices
[PB94-145182] p 3813 N94-31682
Stability and instability criteria for magnetohydrodynamics
[PB94-148475] p 3889 N94-31772
Applied Computational Electromagnetics Society Journal, volume 9, number 1, March 1994
[AD-A276753] p 3679 N94-32183

EIGENVECTORS
Experimental investigation of phonon eigenvectors using x ray interference fields
[ETN-94-95751] p 3865 N94-31511

EJECTORS
A mathematical model for simulating noise suppression of lined ejectors
[NASA-TP-3425] p 3861 N94-32930

EL NINO
Low frequence variability of the ocean atmosphere coupled system p 3777 N94-30986
The effect of westerly wind bursts on a tropical ocean general circulation model
[AD-A276423] p 3788 N94-31448
Air-sea interaction patterns in the equatorial Pacific
[AD-A277305] p 3788 N94-32072
ENSO forced variations of the sea surface temperature and adjusted sea level along the west coast of the United States
[AD-A277306] p 3789 N94-32327

ELASTIC BENDING
A case study of analysis methods for large deflections of a cantilever beam
[NASA-TM-108454] p 3739 N94-32903

ELASTIC BODIES
Vibration localization in dual-span axially moving elastic systems p 3736 N94-31964

ELASTIC DEFORMATION
Deformation and rupture of cylindrical shells under dynamic loading p 3733 N94-31288

ELASTIC PLATES
State of stress, faulting, and eruption characteristics of large volcanoes on Mars p 3940 N94-31108

ELASTIC PROPERTIES
Considering ties elasticities in high frequency rail dynamics
[ILR-MITT-281(1993)] p 3733 N94-31375
Evaluating in-plane elastic constants of damaged carbon-epoxy laminates using a quantitative ultrasonic technique p 3621 N94-31793
Creep-fatigue criteria and inelastic behavior of modified 9Cr-1Mo steel at elevated temperatures
[DE94-007915] p 3642 N94-31918
Nonlinear effects in interfacial fracture
p 3737 N94-31974
Elastic as limit of viscoelastic response, in a context of self-similar viscous limits
[AD-A277043] p 3738 N94-32273
On the mechanics of microballoon-reinforced metal matrix composites
[AD-A277928] p 3630 N94-33178

ELASTOHYDRODYNAMICS
Lubrication with binary mixtures: Liquid-liquid emulsion in elastohydrodynamics and metal forming
p 3658 N94-32490

ELASTOMERS
Novel electroactive polymers and block copolymers
[AD-A276119] p 3650 N94-31509
NMR studies of organic thin films
[AD-A276953] p 3656 N94-32221
Compatibility of refrigerants and lubricants with elastomers
[DE94-008552] p 3658 N94-32518
Electrostrictive response of elastomeric polymers
[AD-A277983] p 3664 N94-33247

ELASTOPLASTICITY
Contributions to the validation of the CJS model for granular materials
[ECL-92-56] p 3733 N94-31376
Micromechanics and effective properties of particulate composites and fluid suspensions p 3703 N94-31744
Influences of pressure-sensitive yielding and non-singular stress on plane-stress elastic-plastic crack-tip fields p 3737 N94-31965

ELECTRETS
A silicon condenser microphone: Modelling and electronic circuitry
[ISBN-9-09-005279-8] p 3688 N94-31517

ELECTRIC ARCS
Development and application of a multimesh auto-adaptive finite element method for the calculation of an electric arc plasma
[ECL-89-03] p 3886 N94-31378
Arcing in space structures in low Earth orbit
[NASA-CR-194223] p 3694 N94-32478
Arc-heater performance research
[NASA-CR-195821] p 3912 N94-32774
Evaluation of pyrolysis and arc tracking on candidate wire insulation designs for space applications
[NASA-CR-195332] p 3731 N94-32901

ELECTRIC AUTOMOBILES
Greenhouse gas emission impacts of electric vehicles under varying driving cycles in various countries and US cities
[DE94-007647] p 3765 N94-32600

ELECTRIC BATTERIES
Draft minutes of IAPG Mechanical Working Group meeting
[DE94-004954] p 3759 N94-31266
Feasibility study for the recycling of nickel metal hydride electric vehicle batteries
[DE94-000268] p 3690 N94-31598
The zinc electrode: Reactions and mechanisms
[DE94-007977] p 3691 N94-31919
Promising future energy storage systems: Nanomaterial based systems, Zn-air, and electromechanical batteries
[DE94-007443] p 3692 N94-32136
The hydrogen hybrid option
[DE94-006733] p 3667 N94-32148
Performance of the Sony lithium-ion rechargeable battery
[AD-A277076] p 3693 N94-32303
Proceedings of the Ad Hoc Workshop on Ceramics for Li/FeS2 batteries
[DE94-007460] p 3694 N94-32607
Low power, constant-flow air pump systems
[DE94-007463] p 3727 N94-32758
Polymer electrolyte fuel cells
[DE94-007558] p 3761 N94-32762
EDD-7 Electric Charge Point Meter test results
[DE94-008515] p 3696 N94-32828
Optimal planning of residential photovoltaic systems under various rate structure
[DE94-757272] p 3762 N94-32919

ELECTRIC BRIDGES
A series resonant converter in half bridge circuits with combined serial and parallel charge coupling and several output circuits
[ETN-94-95739] p 3687 N94-31373

ELECTRIC CHARGE
EDD-7 Electric Charge Point Meter test results
[DE94-008515] p 3696 N94-32828

ELECTRIC CONDUCTORS
Analysis of Dietz's single, rectangular pulse theory for the generation of radiation via photoelectrons
[DE94-006131] p 3681 N94-32661

ELECTRIC CONNECTORS
Hydrogen peroxide electrodes based on electrical connection of redox centers of various peroxidases to electrodes through a three-dimensional electron relaying polymer network
[AD-A276543] p 3691 N94-32056

ELECTRIC CONTACTS
Research on high reliability refractory ohmic contacts for GaAs FETs and MODFETs
[AD-A276848] p 3697 N94-33034

ELECTRIC CURRENT
Laboratory and space experiments as a key to the plasma universe
[TRITA-ALP-1993-01] p 3885 N94-31088
Introduction to electrochemical impedance
[AD-A277081] p 3636 N94-32352

ELECTRIC DISCHARGES
Development of a 3D numerical code to calculate the trajectories of the blow off electrons emitted by a vacuum surface discharge: Application to the study of the electromagnetic interference induced on a spacecraft
[ONERA-NT-1993-12] p 3863 N94-31227
Advanced high frequency partial discharge measuring system
[NASA-CR-195240] p 3697 N94-33044

ELECTRIC ENERGY STORAGE
Promising future energy storage systems: Nanomaterial based systems, Zn-air, and electromechanical batteries
[DE94-007443] p 3692 N94-32136

ELECTRIC EQUIPMENT
Payload holddown and release mechanism
p 3607 N94-33321

ELECTRIC EQUIPMENT TESTS
Influence of carbon dioxide on electronic equipment: Fire extinguishing with low concentration
[PB94-148749] p 3691 N94-31848
Structural probability concepts adapted to electrical engineering
[NASA-TM-106499] p 3739 N94-32735

ELECTRIC FIELDS
The double probe electric field experiment on Freja: Description and first results
[TRITA-ALP-1993-02] p 3885 N94-31089
Electrostatic reduction of particulates for laser resistant hafnia coatings
[DE94-005824] p 3651 N94-31557
Evidence for a correct SiO2 voltage acceleration model
[DE94-006578] p 3690 N94-31594
Transport phenomena in the Earth's plasma sheet
p 3772 N94-31970
A model of the ion chemistry of electrified convection
p 3868 N94-31993
MOM3D method of moments code theory manual
[NASA-CR-189594] p 3682 N94-32897
Electric field-induced changes in odd-numbered nylons
[AD-A278003] p 3664 N94-33138
Electrostrictive response of elastomeric polymers
[AD-A277983] p 3664 N94-33247

ELECTRIC GENERATORS
Draft minutes of IAPG Mechanical Working Group meeting
[DE94-004954] p 3759 N94-31266
Workshop on Commercialization of Pulsed Power Science and Technology Proceedings
[AD-A276987] p 3692 N94-32258

ELECTRIC MOTOR VEHICLES
Energy storage specification requirements for hybrid-electric vehicle
[DE94-008642] p 3694 N94-32521
Proceedings of the Ad Hoc Workshop on Ceramics for Li/FeS2 batteries
[DE94-007460] p 3694 N94-32607
Overview of Sandia's electric vehicle battery program
[DE94-008944] p 3696 N94-32806
Preliminary evaluation of the University of South Florida Mobile Data Acquisition System, the Idaho National Engineering Laboratory Versatile Data Acquisition System, and the Autologger Vehicle User Survey System produced by Instrumental Solutions of Ottawa, Canada for the Site Operator Program Field Data Collection
[DE94-008514] p 3920 N94-32827
EDD-7 Electric Charge Point Meter test results
[DE94-008515] p 3696 N94-32828

ELECTRIC NETWORKS
The Second International Workshop on Discrete Time Domain Modelling of Electromagnetic Fields and Networks. Program and information
[AD-A277136] p 3677 N94-32067

ELECTRIC POTENTIAL
Role of polycrystallinity in CdTe and CuInSe2 photovoltaic cells
[DE94-000293] p 3758 N94-31236
NN-interaction in (1)S0-state: Virtual level or dibaryon resonance?
[DE94-606492] p 3869 N94-32097
Novel failure analysis techniques using photon probing with a scanning optical microscope
[DE94-006594] p 3692 N94-32112

High power switch design for the Nova upgrade laser (Project HERCULES: High Energy Research Concerning the Ultimate Lifetime of Experimental Switches)
[DE94-007921] p 3719 N94-32654
X ray absorption study of pulsed laser deposited boron nitride films
[DE94-008295] p 3662 N94-32855
Stabilization method of A.C. arc plasma
[DE94-757268] p 3893 N94-32916
Advanced high frequency partial discharge measuring system
[NASA-CR-195240] p 3697 N94-33044

ELECTRIC POWER PLANTS
Emissions of greenhouse gases from the use of transportation fuels and electricity
[DE94-006166] p 3765 N94-31625

ELECTRIC POWER SUPPLIES
The 1988 Goddard Space Flight Center Battery Workshop
[NASA-CP-3237] p 3758 N94-31233
Development of silver-zinc cells of improved cycle life and energy density
[AD-A277311] p 3693 N94-32329
Flywheel Energy Storage Technology Workshop
[DE94-008064] p 3761 N94-32705

ELECTRIC POWER TRANSMISSION
Optimal reactive power dispatch of power systems using nonlinear programming
[MATHS-REPT-A-209] p 3808 N94-31164

ELECTRIC WIRE
Evaluation of pyrolysis and arc tracking on candidate wire insulation designs for space applications
[NASA-CR-195332] p 3731 N94-32901

ELECTRICAL ENGINEERING
A silicon condenser microphone: Modelling and electronic circuitry
[ISBN-9-09-005279-8] p 3688 N94-31517
Structural probability concepts adapted to electrical engineering
[NASA-TM-106499] p 3739 N94-32735

ELECTRICAL FAULTS
A hierarchical approach to test generation for CMOS VLSI circuits
[ISBN-9-09-005449-9] p 3689 N94-31535
Hierarchical fault catalog process for diagnosis of analog circuits
[ETN-94-95730] p 3689 N94-31571
X ray pulse considerations and electron flow in high voltage diodes
[AD-A277301] p 3868 N94-32044
Time resolved measurements of light produced by onset of plasma formation on electrodes of fast pulsed high voltage diodes
[AD-A277974] p 3894 N94-33264

ELECTRICAL GROUNDING
Grounding ring for ground adapters
[AD-D016118] p 3697 N94-32962

ELECTRICAL IMPEDANCE
Electromagnetic scattering through loaded aperture panels with nonzero contact impedance
[ONERA-NT-1993-2] p 3673 N94-31418
Introduction to electrochemical impedance
[AD-A277081] p 3636 N94-32352

ELECTRICAL INSULATION
Chemical structure and kinetics at liquid/solid interfaces
[AD-A277112] p 3636 N94-32304
Evaluation of pyrolysis and arc tracking on candidate wire insulation designs for space applications
[NASA-CR-195332] p 3731 N94-32901

ELECTRICAL MEASUREMENT
Advanced high frequency partial discharge measuring system
[NASA-CR-195240] p 3697 N94-33044

ELECTRICAL PROPERTIES
Role of polycrystallinity in CdTe and CuInSe2 photovoltaic cells
[DE94-000293] p 3758 N94-31236
The influence of transmutation, void swelling, and flux/spectra uncertainties on the electrical properties of copper and copper alloys
[DE94-006213] p 3641 N94-31626
Research on the stability, electronic properties, and structure of a-Si:H and its alloys
[DE94-000292] p 3899 N94-31813
Hydrogen peroxide electrodes based on electrical connection of redox centers of various peroxidases to electrodes through a three-dimensional electron relaying polymer network
[AD-A276543] p 3691 N94-32056
The relative performance of FeS2 and CoS in long-life thermal-battery applications
[DE94-006145] p 3695 N94-32663
Research on stable, high-efficiency amorphous silicon multijunction modules
[DE94-000298] p 3695 N94-32680
The ferroelectric behavior of odd-numbered nylons
[AD-A278126] p 3663 N94-33058
Electrical characteristics of GaAs MESFET fabrication by ion implantation of Si or Se
[AD-A278416] p 3909 N94-33328

ELECTRICAL RESISTANCE
The constant current loop: A new paradigm for resistance signal conditioning p 3685 N94-32461
Space flight printed wiring board measling investigation
[NASA-TM-104602] p 3732 N94-33101

ELECTRICAL RESISTIVITY
Analysis of deep seismic reflection and other data from the southern Washington Cascades
[DE94-005958] p 3771 N94-31525
The influence of transmutation, void swelling, and flux/spectra uncertainties on the electrical properties of copper and copper alloys
[DE94-006213] p 3641 N94-31626
Fermi surface instability at 0.4 K in a heavy-fermion YbBiPt: SDW?
[DE94-006224] p 3899 N94-31916
Oxidation resistant copper
[AD-D016099] p 3696 N94-32721
Strongly anisotropic s-wave versus d-wave gap in cuprate superconductors: Evidence and theory
[DE94-007579] p 3904 N94-32746
Isothermal sintering, microstructure, and superconducting properties of Y1Ba2Cu3O(7-x) compound
[DE94-008132] p 3905 N94-32779
Properties of doped and undoped (Ca,Sr)CuO2 thin films
[DE94-007230] p 3905 N94-32785
An electrical test system for conductor formation process analysis
[DE94-007291] p 3696 N94-32786
Resistivity measurements on the neutron irradiated detector grade silicon materials
[DE94-009083] p 3906 N94-32822
Analytic formulation for the ac electrical conductivity in two-temperature, strongly coupled, overdense plasma: FORTRAN subroutine
[DE94-009466] p 3893 N94-32915
Lightweight zinc electrode
[AD-D016181] p 3698 N94-33181

ELECTRICITY
Solar activities at Sandia National Laboratories
[DE94-007737] p 3761 N94-32648

ELECTRO-OPTICAL EFFECT
Manufacture of light-damage resistant, planar, single mode waveguide on lithium niobate
[DSIS-94-01503] p 3879 N94-31850
Reconfigurable optical switches with monolithic electrical-to-optical interfaces
[DE94-007745] p 3881 N94-32385
Energetics, bonding mechanism, and electronic structure of ceramic/ceramic and metal/ceramic interfaces
[DE94-008551] p 3659 N94-32656
Characterization of crosslinked electrooptic polyimides
[DE94-007934] p 3661 N94-32819

ELECTRO-OPTICS
The conoscopic microscope
[TELECOM-93-E-017] p 3877 N94-31173
Electrooptic crystal growth and properties
[AD-A276023] p 3896 N94-31439
Manufacture of light-damage resistant, planar, single mode waveguide on lithium niobate
[DSIS-94-01503] p 3879 N94-31850
Recent developments in polymeric charge transfer complexes
[AD-A277108] p 3654 N94-31979
The sol-gel-xerogel transition
[AD-A276647] p 3616 N94-32038
Multifunctional macromolecules
[AD-A277347] p 3656 N94-32246
Stable second-order nonlinear optical materials based on interpenetrating polymer networks
[AD-A277410] p 3658 N94-32579
Energetics, bonding mechanism, and electronic structure of ceramic/ceramic and metal/ceramic interfaces
[DE94-008551] p 3659 N94-32656
Characterization of thermally stable dye-doped polyimide based electrooptic materials
[DE94-005309] p 3882 N94-32674
Reconfigurable Array of Radiating Elements (RARE) controlled by light
[NASA-CR-195828] p 3884 N94-33073

ELECTROACOUSTICS
Minutes: Accredited Standards Committee on Bioacoustics, S3. US TAG for ISO/TC 43, acoustics, IEC/TC 29 electroacoustics, and ISO/TC 108/SC4 human exposure to mechanical vibration and shock
[AD-A276201] p 3795 N94-31490

ELECTROCATALYSTS
Polymer electrolyte fuel cells
[DE94-007558] p 3761 N94-32762

ELECTROCHEMICAL CELLS
Dielectric viscometer including fixed and variable cells
[AD-D016139] p 3639 N94-32973
Room temperature molten salts for advanced energy conversion and storage
[AD-A277777] p 3763 N94-33015

ELECTROCHEMICAL OXIDATION
Synthesis, characterization, phase diagrams and superconducting, and normal state magnetic properties of La(2-x)Sr(x)CuO4 (0 is less than or equal to x which is less than or equal to 0.08) and electrochemically oxidized La(2-x)Sr(x)CuO(4 + delta) (0 is less than or equal to x which is less than or equal to 0.33, 0 is less than or equal to delta which is less than or equal to 0.12)
[DE94-005260] p 3895 N94-31067
Electrochemical surface modification of silicon monocrystals: A surface analytic examination
[ETN-94-95733] p 3633 N94-31574
Electrical communication between glucose oxidase and electrodes based on poly(vinylimidazole) complex of Os(bpy)2Cl2
[AD-A276585] p 3635 N94-32231

ELECTROCHEMISTRY
Infrared spectroelectrochemical study of cyanide adsorption and reactions at platinum electrodes in aqueous perchlorate electrolyte
[AD-A276402] p 3631 N94-31238
The zinc electrode: Reactions and mechanisms
[DE94-007977] p 3691 N94-31919
Hydrogen peroxide electrodes based on electrical connection of redox centers of various peroxidases to electrodes through a three-dimensional electron relaying polymer network
[AD-A276543] p 3691 N94-32056
Electrical communication between glucose oxidase and electrodes based on poly(vinylimidazole) complex of Os(bpy)2Cl2
[AD-A276585] p 3635 N94-32231
Introduction to electrochemical impedance
[AD-A277081] p 3636 N94-32352
Scanning tunneling microscopy and infrared spectroscopy as combined in-situ probes of electrochemical adlayer structure: Cyanide on Pt(111)
[AD-A276715] p 3909 N94-33274
Nanoscale structural changes upon electrooxidation of Au(111) as probed by potentiodynamic scanning tunneling microscopy
[AD-A276780] p 3909 N94-33275

ELECTRODE MATERIALS
Hydrogen peroxide electrodes based on electrical connection of redox centers of various peroxidases to electrodes through a three-dimensional electron relaying polymer network
[AD-A276543] p 3691 N94-32056
A new-type of long-range restructuring of ordered metal surfaces induced by lateral adsorbate interactions: Iodide on AU(110) electrodes
[AD-A276633] p 3643 N94-32060
Proceedings of the Ad Hoc Workshop on Ceramics for Li/FeS2 batteries
[DE94-007460] p 3694 N94-32607

ELECTRODEPOSITION
Computerized Ultrasonic Testing System (CUTS) for in-process thickness determination
p 3862 N94-32456

ELECTRODES
Molecular dynamics computer simulations of charged metal electrode-aqueous electrolyte interfaces
[AD-A276401] p 3863 N94-31237
Infrared spectroelectrochemical study of cyanide adsorption and reactions at platinum electrodes in aqueous perchlorate electrolyte
[AD-A276402] p 3631 N94-31238
The zinc electrode: Reactions and mechanisms
[DE94-007977] p 3691 N94-31919
The charging effect in high-Tc superconducting thin films
[AD-A277265] p 3900 N94-32040
Hydrogen peroxide electrodes based on electrical connection of redox centers of various peroxidases to electrodes through a three-dimensional electron relaying polymer network
[AD-A276543] p 3691 N94-32056
A new-type of long-range restructuring of ordered metal surfaces induced by lateral adsorbate interactions: Iodide on AU(110) electrodes
[AD-A276633] p 3643 N94-32060
Charge-dependent atomic-scale structures of high-index and (110) gold electrode surfaces as revealed by scanning tunneling microscopy
[AD-A276782] p 3869 N94-32170

Electrical communication between glucose oxidase and electrodes based on poly(vinylimidazole) complex of Os(bpy)2Cl2
[AD-A276585] p 3635 N94-32231
Structure-property relationships of carbon aerogels
[DE94-007120] p 3660 N94-32687
Arc-heater performance research
[NASA-CR-195821] p 3912 N94-32774
Ionization EM calorimetry with accordion electrodes and liquid krypton or argon
[DE94-009082] p 3713 N94-32821
Magnetohydrodynamic boundary layer control system
[AD-D016120] p 3710 N94-32958
Dielectric viscometer including fixed and variable cells
[AD-D016139] p 3639 N94-32973
Lightweight zinc electrode
[AD-D016181] p 3698 N94-33181
Time resolved measurements of light produced by onset of plasma formation on electrodes of fast pulsed high voltage diodes
[AD-A277974] p 3894 N94-33264

ELECTROLYTES
Molecular dynamics computer simulations of charged metal electrode-aqueous electrolyte interfaces
[AD-A276401] p 3863 N94-31237
Infrared spectroelectrochemical study of cyanide adsorption and reactions at platinum electrodes in aqueous perchlorate electrolyte
[AD-A276402] p 3631 N94-31238
Electrochemical surface modification of silicon monocrystals: A surface analytic examination
[ETN-94-95733] p 3633 N94-31574
The zinc electrode: Reactions and mechanisms
[DE94-007977] p 3691 N94-31919
A new-type of long-range restructuring of ordered metal surfaces induced by lateral adsorbate interactions: Iodide on AU(110) electrodes
[AD-A276633] p 3643 N94-32060
Charge-dependent atomic-scale structures of high-index and (110) gold electrode surfaces as revealed by scanning tunneling microscopy
[AD-A276782] p 3869 N94-32170
The relative performance of FeS2 and CoS in long-life thermal-battery applications
[DE94-006145] p 3695 N94-32663
Sensitivity of electrochemical adlayer structure to the metal crystallographic orientation: Potential-independent iodide adsorption on Au(100) in comparison with other low-index surfaces
[AD-A276714] p 3909 N94-33273
A tandem microscopic-electrochemical examination of a charge-induced surface phase sequence: Ordered Au(110) in aqueous iodide electrolytes as probed by potentiodynamic scanning tunneling microscopy
[AD-A276905] p 3875 N94-33277

ELECTROLYTIC CELLS
Polymer electrolyte fuel cells
[DE94-007558] p 3761 N94-32762

ELECTROMAGNETIC ABSORPTION
Matter-radiation interactions in the atmosphere
p 3776 N94-30998
Near resonant absorption by atoms in intense fluctuating laser fields
[DE94-005873] p 3714 N94-31200
Structural studies of photoinduced intramolecular electron transfer in cyclopentadienylnickelnitrosyl
[DE94-008467] p 3874 N94-32876

ELECTROMAGNETIC COUPLING
Lightning-induced coupling of the radiation belts to geomagnetically conjugate ionospheric regions
p 3772 N94-31773

ELECTROMAGNETIC FIELDS
Development of a 3D numerical code to calculate the trajectories of the blow off electrons emitted by a vacuum surface discharge: Application to the study of the electromagnetic interference induced on a spacecraft
[ONERA-NT-1993-12] p 3863 N94-31227
Formulation of time-domain planar near-field measurements without probe correction
[AD-A276380] p 3672 N94-31371
Finite element analysis of time-independent superconductivity p 3691 N94-31905
The Second International Workshop on Discrete Time Domain Modelling of Electromagnetic Fields and Networks. Program and information
[AD-A277136] p 3677 N94-32067
System for monitoring and analyzing field energy exposure
[AD-D016115] p 3681 N94-32625

ELECTROMAGNETIC INTERACTIONS
Evaluation of HardSys/HardDraw, an expert system for electromagnetic interactions modelling
[AD-A276218] p 3670 N94-31063
Microwave dielectric behavior of soils. Report 1: Summary of related research and applications
[AD-A275980] p 3771 N94-31351
Diagnostics of high-brightness short-pulse lasers and the plasmas they generate
[DE94-006165] p 3716 N94-31624
Baryogenesis from a primordial lepton asymmetry
[PB94-145166] p 3868 N94-31921
Short-pulse, high-intensity lasers at Los Alamos
[DE94-007545] p 3720 N94-32760
Proceedings of the International Workshop on Low Energy Muon Science: LEMS 1993
[DE94-006495] p 3874 N94-32804
MOM3D method of moments code theory manual
[NASA-CR-189594] p 3682 N94-32897

ELECTROMAGNETIC INTERFERENCE
An adaptive Kalman filter excisor for suppressing narrowband interference
[AD-A276286] p 3671 N94-31253

ELECTROMAGNETIC NOISE
Fractal and spectral analysis
[ISBN-0-315-86460-5] p 3676 N94-31796
Optimal adaptive estimation algorithm for harmonic current reduction using power limited active line conditioners
[AD-A277354] p 3693 N94-32336
Restoration of interferometric, polarimetric, radiometric, and textural information in SAR images
p 3750 N94-32535
NOAA-9 Earth Radiation Budget Experiment (ERBE) scanner offsets determination
[NASA-TM-109086] p 3785 N94-32737
Reliable communication in the presence of severe noise or jamming
[AD-A276410] p 3684 N94-33173

ELECTROMAGNETIC PROPERTIES
Evaluation of HardSys/HardDraw, an expert system for electromagnetic interactions modelling
[AD-A276218] p 3670 N94-31063

ELECTROMAGNETIC PULSES
Diagnostics of high-brightness short-pulse lasers and the plasmas they generate
[DE94-006165] p 3716 N94-31624
High peak power microwaves: A health hazard
[AD-A277168] p 3681 N94-32576
Superluminous laser pulse in an active medium
[DE94-007110] p 3720 N94-32684
Pump-probe method for investigating laser ablation and optical damage threshold mechanisms in optical materials
[DE94-008291] p 3720 N94-32753
Short-pulse, high-intensity lasers at Los Alamos
[DE94-007545] p 3720 N94-32760
Ultrafast x ray sources
[AD-A277455] p 3721 N94-33012

ELECTROMAGNETIC RADIATION
Radiation/remote sensing: Review of the principal definitions p 3757 N94-30996
Analysis of the photodiode boundary layer transition indicator
[DE94-005311] p 3701 N94-31268
Photonic band gap materials
[DE94-005566] p 3677 N94-32101
Electromagnetic wave reflection from irregular plasma layers
[AD-A276727] p 3678 N94-32161
System for monitoring and analyzing field energy exposure
[AD-D016115] p 3681 N94-32625
Analysis of Dietz's single, rectangular pulse theory for the generation of radiation via photoelectrons
[DE94-006131] p 3681 N94-32661

ELECTROMAGNETIC SCATTERING
Electromagnetic scattering through loaded aperture panels with nonzero contact impedance
[ONERA-NT-1993-2] p 3673 N94-31418
Multiple scattering of polarized radiation in planetary atmospheres
[ETN-94-96018] p 3674 N94-31551
Development of a frequency-domain electromagnetic scattering measurement system
[AD-A276738] p 3678 N94-32179
Applied Computational Electromagnetics Society Journal, volume 9, number 1, March 1994
[AD-A276753] p 3679 N94-32183
Studies of optical beam phase conjugation and electromagnetic scattering process
[AD-A278389] p 3884 N94-33145

ELECTROMAGNETIC SPECTRA
Economic analysis of the hertzian spectrum
[TELECOM-93-E-012] p 3670 N94-31171

ELECTROMAGNETIC WAVE FILTERS
Study of continuous-time and mixed analog-digital operators
[TELECOM-93-E-010] p 3687 N94-31170
Analysis and design of a formal neural network for filtering a dynamic signal
[ISBN-0-315-86932-1] p 3832 N94-31873
Advanced satellite communication system
[NASA-CR-194211] p 3681 N94-32477

ELECTROMAGNETIC WAVE TRANSMISSION
The High-Frequency Benchmark propagation program
[AD-A276323] p 3672 N94-31334
Photonic band gap materials
[DE94-005566] p 3677 N94-32101
Atmospheric propagation effects through natural and man-made obscurants for visible to MM-wave radiation
[AD-A276919] p 3679 N94-32235

ELECTROMAGNETISM
Applied Computational Electromagnetics Society Journal, volume 9, number 1, March 1994
[AD-A276753] p 3679 N94-32183

ELECTROMECHANICAL DEVICES
Promising future energy storage systems: Nanomaterial based systems, Zn-air, and electromechanical batteries
[DE94-007443] p 3692 N94-32136

ELECTROMOTIVE FORCES
Theoretical principles for designing long stator/linear motors with iron
[ETN-94-95741] p 3688 N94-31374
Applicable dimensioning and measure and technological examination of long stator-linear motors for magnetic high-speed railways
[ETN-94-95734] p 3689 N94-31575

ELECTRON ACCELERATION
Time-dependent behavior of active galactic nuclei with pair production p 3929 N94-31125
Electron acceleration system
[AD-D016143] p 3893 N94-32977

ELECTRON ACCELERATORS
Concept, construction and testing of a high resolution QCLAM electron spectrometer with large solid angle and high impulse acceptance for the electron accelerator S-DALINAC
[ETN-94-95755] p 3711 N94-31515
Repetitively pulsed backward-wave oscillator investigations
[AD-A278281] p 3698 N94-33142

ELECTRON ATTACHMENT
Electron: Cluster interactions
[DE94-009089] p 3874 N94-32807

ELECTRON BEAMS
Electron-beam controlled semiconductor switches
[AD-A276198] p 3686 N94-31057
Instrumentation for EXELFS measurements using convergent beam diffraction coupling to the electron energy loss spectrometer
[USIP-93-07] p 3358 N94-31084
Proceedings of the 37th international symposium on electron, ion, and photon beams
[AD-A276478] p 3875 N94-31247
Emission from ferroelectric cathodes
[DE94-006732] p 3863 N94-31270
Spectroscopy and atomic physics in EBIT and SuperEBIT
[DE94-006050] p 3864 N94-31508
Two-gigawatt burst-mode operation of the Intense Microwave Prototype (IMP) Free-Electron Laser (FEL) for the Microwave Tokamak Experiment (MTX)
[DE94-006613] p 3715 N94-31580
First-wall heat-flux measurements during ELMing H-mode plasma
[DE94-008310] p 3888 N94-31765
ITS version 3.0: Powerful, user-friendly software for radiation modelling
[DE94-006607] p 3678 N94-32113
Complete model description of an electron beam using ACCEPT Monte Carlo simulation code
[DE94-007063] p 3872 N94-32628
Electron energy dependence of amorphization in Zr3Fe
[DE94-008459] p 3906 N94-32875
Electron acceleration system
[AD-D016143] p 3893 N94-32977
Repetitively pulsed backward-wave oscillator investigations
[AD-A278281] p 3698 N94-33142

ELECTRON BUNCHING
Free electrons as a versatile source of coherent radiation
[ETN-94-96011] p 3715 N94-31545

ELECTRON CAPTURE
Spectroscopy and atomic physics in EBIT and SuperEBIT
[DE94-006050] p 3864 N94-31508

ELECTRON CYCLOTRON HEATING
Noninductive current drive experiments on D3-D, and future plans
[DE94-007373] p 3886 N94-31324
Two-gigawatt burst-mode operation of the Intense Microwave Prototype (IMP) Free-Electron Laser (FEL) for the Microwave Tokamak Experiment (MTX)
[DE94-006613] p 3715 N94-31580

FWCD and ECCD experiments on D3-D
[DE94-007371] p 3890 N94-32201
Fusion applications of high power millimeter wave sources
[DE94-007374] p 3718 N94-32202

ELECTRON DENSITY (CONCENTRATION)
Radar scattering from the summer polar mesosphere: Theory and observations p 3772 N94-32077
Electromagnetic wave reflection from irregular plasma layers
[AD-A276727] p 3678 N94-32161
Calculations of nonspherically averaged charge densities for substitutionally disordered alloys
[DE94-008293] p 3646 N94-32754
Anisotropic phase separation through the metal-insulator transition in amorphous Mo-Ge and Fe-Ge alloys
[DE94-007259] p 3646 N94-32795
A study of weak solutions and their regularizations by numerical methods
[AD-A277453] p 3850 N94-33175
Phase relationships and stability of the (mu)- and (zeta)-phases in the Ag-Al-X (X=Zn, Ga, Ge) systems
[DE94-009391] p 3648 N94-33270

ELECTRON DENSITY PROFILES
An analysis of ionospheric dayglow from observations of the Naval Postgraduate School Middle Ultraviolet Spectrograph (MUSTANG)
[AD-A277351] p 3773 N94-32335
EUROCAP program
[AD-A278084] p 3776 N94-33184

ELECTRON DIFFRACTION
Instrumentation for EXELFS measurements using convergent beam diffraction coupling to the electron energy loss spectrometer
[USIP-93-07] p 3858 N94-31084
Nucleation and growth of cubic boron nitride films produced by ion-assisted pulsed laser deposition
[DE94-007295] p 3661 N94-32796
Imaging of surface structure with energy-dependent photoelectron diffraction
[DE94-009096] p 3907 N94-32934

ELECTRON DIFFUSION
Radar scattering from the summer polar mesosphere: Theory and observations p 3772 N94-32077

ELECTRON DISTRIBUTION
A comprehensive analysis of electron conical distributions from multi-satellite databases
[NASA-CR-195848] p 3953 N94-33047

ELECTRON EMISSION
Emission from ferroelectric cathodes
[DE94-006732] p 3863 N94-31270
X ray pulse considerations and electron flow in high voltage diodes
[AD-A277301] p 3868 N94-32044
Time resolved measurements of light produced by onset of plasma formation on electrodes of fast pulsed high voltage diodes
[AD-A277974] p 3894 N94-33264

ELECTRON ENERGY
Free electrons as a versatile source of coherent radiation
[ETN-94-96011] p 3715 N94-31545
X ray pulse considerations and electron flow in high voltage diodes
[AD-A277301] p 3868 N94-32044
Electron energy dependence of amorphization in Zr3Fe
[DE94-008459] p 3906 N94-32875
Irradiation-induced phase transformations in zirconium alloys
[DE94-008484] p 3648 N94-32993

ELECTRON IMPACT
Production and detection of metastable atomic oxygen
[ISBN-0-315-87364-7] p 3868 N94-31915

ELECTRON IRRADIATION
Irradiation-induced phase transformations in zirconium alloys
[DE94-008484] p 3648 N94-32993

ELECTRON MICROSCOPES
In-situ TEM crystallization of anorthite-glass films on (alpha)-Al2O3
[DE94-008317] p 3652 N94-31780

ELECTRON MICROSCOPY
Microstructures and mechanical properties of Al3Ti-based alloys: Analysis in single phase and multiphase systems
[ONERA-NT-1993-6] p 3640 N94-31420

ELECTRON ORBITALS
Occupied and unoccupied orbitals of C60 and C70
[DE94-008294] p 3873 N94-32755
Investigation of superconductivity and magnetism in d and f-electron materials
[DE94-006535] p 3907 N94-32933

ELECTRON PARAMAGNETIC RESONANCE
Electron spin resonance measurements of Er(3+) and Mn(2+) in the high temperature superconductor compounds La(2-x)Sr(x)CuO(4-delta)
[ETN-94-95746] p 3898 N94-31612

ELECTRON PHONON INTERACTIONS
Experimental evidence for lattice effects in high temperature superconductors
[DE94-006250] p 3899 N94-31633

ELECTRON PLASMA
Transport properties of quark and gluon plasmas
[DE94-007043] p 3864 N94-31405

ELECTRON PRECIPITATION
Convection and electrodynamic signatures in the vicinity of a Sun-aligned arc: Results from the Polar Acceleration Regions and Convection Study (Polar ARCS)
p 3954 N94-31102

ELECTRON PROBES
Deuterium absorption and material phase characteristics of SAES St198 Zr-Fe alloy
[DE94-008275] p 3648 N94-32781

ELECTRON RADIATION
ITS version 3.0: Powerful, user-friendly software for radiation modelling
[DE94-006607] p 3678 N94-32113
Self-consistent effects of magnetospheric hydromagnetic waves on ring current ions
[AD-A277406] p 3774 N94-32346

ELECTRON SCATTERING
Convective solar nebula p 3930 N94-31130
Results from the H1 experiment at HERA
[PB94-145174] p 3868 N94-32008
Electron: Cluster interactions
[DE94-009089] p 3874 N94-32807

ELECTRON SPECTROSCOPY
Analytical applications of scanning tunneling microscopy
[AD-A276066] p 3711 N94-31283
Concept, construction and testing of a high resolution QCLAM electron spectrometer with large solid angle and high impulse acceptance for the electron accelerator S-DALINAC
[ETN-94-95755] p 3711 N94-31515

ELECTRON SPIN
Experimental evidence for lattice effects in high temperature superconductors
[DE94-006250] p 3899 N94-31633

ELECTRON TRAJECTORIES
Development of a 3D numerical code to calculate the trajectories of the blow off electrons emitted by a vacuum surface discharge: Application to the study of the electromagnetic interference induced on a spacecraft
[ONERA-NT-1993-12] p 3863 N94-31227

ELECTRON TRANSFER
A visible light initiating system for free radical promoted cationic polymerization
[AD-A277164] p 3655 N94-32069
A general stochastic Liouville theory for sequential and superexchange electron-transfer reactions involving three Marcus potential surfaces
[DE94-007695] p 3869 N94-32141
Some perspectives on solution-phase electron-transfer processes
[AD-A276906] p 3635 N94-32216
Theoretical studies of electron transfer and optical spectroscopy
[DE94-006985] p 3871 N94-32375
Structural studies of photoinduced intramolecular electron transfer in cyclopentadienylnickelnitrosyl
[DE94-008467] p 3874 N94-32876
A study of weak solutions and their regularizations by numerical methods
[AD-A277453] p 3850 N94-33175

ELECTRON TRANSITIONS
Stark broadening of the 2S state of hydrogen and deuterium in arc plasmas of low density
[ETN-94-95731] p 3888 N94-31572
Progress in understanding and improving x ray lasers
[DE94-006048] p 3720 N94-32794

ELECTRON-POSITRON PAIRS
A constraint on the pair-density ratio (Z+) in an electron-positron pair wind p 3930 N94-31132
Gamma Large Area Silicon Telescope (GLAST)
[DE94-006439] p 3925 N94-31786
F0-975, A0-980 as eye-witnesses of confinement
[PB94-147105] p 3868 N94-31923

ELECTRONIC BULLETIN BOARDS
The FELICIA bulletin board system and the IRBIS anonymous FTP server: Computer security information sources for the DOE community
[DE94-008219] p 3825 N94-31920

ELECTRONIC CONTROL
Custom uniform source system
[NASA-CR-189332] p 3711 N94-31492
International Space Station Alpha's bearing, motor, and roll ring module developmental testing and results
p 3803 N94-33295

ELECTRONIC COUNTERMEASURES
Analysis of key performance parameters of phase sampling digital RF memories
[AD-A276019] p 3688 N94-31494
Atmospheric propagation effects through natural and man-made obscurants for visible to MM-wave radiation
[AD-A276919] p 3679 N94-32235

ELECTRONIC EQUIPMENT
The 18th annual electronics manufacturing seminar
[AD-A276038] p 3687 N94-31281
Proceedings of the International Workshop on Computational Electronics
[AD-A277020] p 3692 N94-32259
Vulnerability assessment of a space based weapon platform electronic system exposed to a thermonuclear weapon detonation
[DE94-007229] p 3611 N94-32667

ELECTRONIC EQUIPMENT TESTS
Module generation for self-testing integrated systems
[ISBN-9-09-004570-8] p 3688 N94-31520
Validation of the Environmentally Conscious Manufacturing Integrated Demonstration hardware
[DE94-003824] p 3765 N94-32144
The CF-18 diagnostic and maintenance expert system project p 3567 N94-33338
A diagnostic expert system for digital circuits
p 3699 N94-33340

ELECTRONIC MAIL
PEM public key certificate cache server
[DE94-006404] p 3675 N94-31784
Electronic mail and organizational knowledge: Media use in a global corporation
[AD-A276707] p 3678 N94-32121

ELECTRONIC MODULES
Heat transfer studies on a rectangular channel with offset plate fins
[AD-A277300] p 3912 N94-32043
Detailed design of the 2MW Demonstration Plant
[DE94-000042] p 3762 N94-32823
Ceramic and metal composite circuit-board-level technology for application specific electronic modules (ASEM)
[AD-A277961] p 3630 N94-33180

ELECTRONIC PACKAGING
Flexible manufacturing for photonics device assembly
p 3669 N94-32449
Metal-ion spin-on glasses: Novel materials for active waveguides
[DE94-007738] p 3882 N94-32649
Automated fiber pigtailing technology
[DE94-007072] p 3695 N94-32688

ELECTRONIC WARFARE
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-electronic warfare module, volume 9
[AD-A276976] p 3589 N94-32315
Automatic modulation recognition
p 3686 N94-33153
A decision support system for electronic warfare analysts p 3853 N94-33336

ELECTRONS
Time-dependent behavior of active galactic nuclei with pair production p 3929 N94-31125
Elimination of two atomic electrons by a single high energy photon
[DE94-006834] p 3864 N94-31320
X ray pulse considerations and electron flow in high voltage diodes
[AD-A277301] p 3868 N94-32044
ITS version 3.0: Powerful, user-friendly software for radiation modelling
[DE94-006607] p 3678 N94-32113
Self-consistent effects of magnetospheric hydromagnetic waves on ring current ions
[AD-A277406] p 3774 N94-32346
Ionization EM calorimetry with accordion electrodes and liquid krypton or argon
[DE94-009082] p 3713 N94-32821

ELECTROPHORESIS
An axial approach to detection in capillary electrophoresis
[DE94-005556] p 3631 N94-31154

ELECTROPHYSIOLOGY
The organization of the suprachiasmatic circadian pacemaker of the rat and its regulation by neurotransmitters and modulators
[AD-A277324] p 3793 N94-32622

ELECTRORHEOLOGICAL FLUIDS
Vibration dampener and method for making same
[AD-D016094] p 3739 N94-32733
Light scattering studies of a model electrorheological fluid
[DE94-007860] p 3883 N94-32818

ELECTROSTATIC CHARGE
Influence of carbon dioxide on electronic equipment: Fire extinguishing with low concentration
[PB94-148749] p 3691 N94-31848
ELECTROSTATICS
Electrostatic reduction of particulates for laser resistant hafnia coatings
[DE94-005824] p 3651 N94-31557
ELECTROSTRICTION
Electrostrictive response of elastomeric polymers
[AD-A277983] p 3664 N94-33247
ELECTROWEAK MODEL
Proceedings of the International Workshop on Low Energy Muon Science: LEMS 1993
[DE94-006495] p 3874 N94-32804
ELEMENTARY EXCITATIONS
Collective and quasiparticle excitations in light Pb isotopes
[ETN-94-96014] p 3865 N94-31548
Impurities and conductivity in a D-wave superconductor
[DE94-006222] p 3898 N94-31628
Strongly anisotropic s-wave versus d-wave gap in cuprate superconductors: Evidence and theory
[DE94-007579] p 3904 N94-32746
ELEMENTARY PARTICLE INTERACTIONS
State of hadron collider physics
[DE94-005279] p 3863 N94-31147
BNL possibilities
[DE94-007179] p 3864 N94-31398
F0-975, A0-980 as eye-witnesses of confinement
[PB94-147105] p 3868 N94-31923
Positron-molecule interactions
[AD-A276542] p 3869 N94-32082
The Nijmegen hyperon-nucleon potentials
[DE94-007557] p 3869 N94-32139
Numerical simulation of quantum many-body systems
[DE94-008451] p 3912 N94-32513
A guide to experimental elementary particle physics literature, 1988-1992
[DE94-007445] p 3873 N94-32768
Studies of jet production with the D0 detector
[DE94-008271] p 3873 N94-32780
ELEMENTARY PARTICLES
Elementary particle physics
[DE94-006071] p 3866 N94-31620
A guide to experimental elementary particle physics literature, 1988-1992
[DE94-007445] p 3873 N94-32768
ELEVATION
Geoid-to-topography ratios on Venus: A global perspective p 3940 N94-31110
World height system definition and implementation
[AD-A276725] p 3747 N94-32160
Study of subpolar glaciers of Spitzbergen using SPOT, ERS-1, and hypsometric data: Results and perspectives p 3753 N94-32553
ELEVATION ANGLE
Prediction of the plane wave beamformed acoustic arrival structure for the 1992 Barents Sea coastal tomography test
[AD-A276741] p 3788 N94-32181
ELLIPSOMETERS
Post-calibration correction for rotating-analyzer ellipsometer with optical fiber bundle detection system
[AD-A277329] p 3881 N94-32280
ELLIPSOMETRY
Post-calibration correction for rotating-analyzer ellipsometer with optical fiber bundle detection system
[AD-A277329] p 3881 N94-32280
Si/SiO2 interface studies by immersion ellipsometry
[AD-A277277] p 3881 N94-32324
Electron cyclotron resonance plasma oxidation studies of InP
[AD-A277431] p 3893 N94-33007
ELLIPTIC DIFFERENTIAL EQUATIONS
Variational elliptic solver for atmospheric applications
[DE94-007725] p 3774 N94-32647
ELLIPTIC FUNCTIONS
Transformation of two and three-dimensional regions by elliptic systems
[NASA-CR-195849] p 3821 N94-33049
ELLIPTICAL GALAXIES
Line-strength gradients and kinematic profiles in elliptical galaxies p 3934 N94-31788
ELLIPTICAL ORBITS
Multisatellite constellation configuration selection for multiregional highly elliptical orbit constellations p 3600 N94-31437
Testing for preferred-frame effects in gravity with artificial Earth satellites
[PB94-148459] p 3610 N94-31771
EMBEDDED COMPUTER SYSTEMS
The maintenance of operational flight program
[AD-A276363] p 3565 N94-31367
Technologies for avionics embedded computer systems
[AD-A276364] p 3581 N94-31368
Testing Operational Flight Programs (OFP's)
[AD-A276361] p 3578 N94-31387
Interpreter composition issues in the formal verification of a processor-memory module
[NASA-CR-4594] p 3820 N94-32775
EMBRITTLEMENT
Metal induced embrittlement
[DE94-007450] p 3640 N94-31325
Boron and hydrogen in Ni3Al. Part 2: Mechanical testing of bicrystals
[DE94-007441] p 3904 N94-32606
Reactor pressure vessel structural integrity research in the US Nuclear Regulatory Commission HSST and HSSI Programs
[DE94-006550] p 3739 N94-32771
EMERGENCIES
Technical evaluation of the UH-60Q: Aircraft in typical aeromedical evacuation missions
[AD-A276944] p 3586 N94-32217
EMERGENCY BREATHING TECHNIQUES
Development and enhancement of a model of performance and decision making under stress in a real life setting
[AD-A276029] p 3799 N94-31440
EMISSION
Theoretical studies of x ray emission from clusters of galaxies p 3954 N94-31103
EMISSION SPECTRA
Observational constraints on black hole accretion disks p 3929 N94-31126
Spectroscopic study of the molecular collisions (hydrogen-nitrogen and hydrogen-oxygen) at energies of several MeV
[ISBN-0-315-86794-9] p 3867 N94-31753
An analysis of ionospheric dayglow from observations of the Naval Postgraduate School Middle Ultraviolet Spectrograph (MUSTANG)
[AD-A277351] p 3773 N94-32335
Thermal emission measurements (5-25 microns) of Hawaiian palagonitic soils with implications for Mars p 3944 N94-33193
EMISSIVITY
Development of a statistical method for estimating the downward longwave radiation at the surface from satellite observations p 3742 N94-31553
A study of areas of low radio-thermal emissivity on Venus p 3942 N94-31992
Dual-band infrared imaging to detect corrosion damage within airframes and concrete structures
[DE94-006047] p 3580 N94-32658
EMITTANCE
Performance of silvered Teflon (trademark) thermal control blankets on spacecraft p 3591 N94-31014
Vulnerability assessment of a space based weapon platform electronic system exposed to a thermonuclear weapon detonation
[DE94-007229] p 3611 N94-32667
EMITTERS
RF vacuum microelectronics
[AD-A276512] p 3691 N94-31928
EMPLOYMENT
European business confronted with the 21st century: Men, the essential risk
[ESA-SP-1167] p 3914 N94-31181
EMULSIONS
Structure and dynamics of microemulsions in bulk, at interfaces, and in confined geometries
[DE94-006043] p 3633 N94-31526
Lubrication with binary mixtures: Liquid-liquid emulsion in elastohydrodynamics and metal forming p 3658 N94-32490
END EFFECTORS
Control of a flexible space robot tracking a moving target p 3722 N94-31469
Robot grasping: Stability and optimization issues p 3724 N94-31724
Development of a robotic simulator for studying interference and contact problems
[ISBN-0-315-86705-1] p 3588 N94-31747
Application of contact mechanics for the validation of robotized operations of grasping objects subjected to static and dynamic force fields
[ISBN-0-315-86831-7] p 3725 N94-31754
Automatic analysis of force distribution in multi-fingered articulated hands
[ISBN-0-315-87205-5] p 3725 N94-31878
Parallel methods for synthesizing whole-hand grasps from generalized prototypes
[AD-A276798] p 3726 N94-32166
Application of dexterous space robotics technology to myoelectric prostheses p 3729 N94-32450
Development of an interchangeable end effector mechanism for the Ranger telerobotic vehicle p 3604 N94-33297
ENERGETIC PARTICLES
Collisional and chaotic transport of energetic particles in toroidal plasma
[DE94-006504] p 3889 N94-31787
Basic principles approach for studying nonlinear Alfven wave-alpha particle dynamics
[DE94-007112] p 3891 N94-32664
ENERGY ABSORPTION
Transient radiation-induced absorption in the materials for a GSGG laser
[DE94-005316] p 3714 N94-31148
Rotorcraft ditchings and water-related impacts that occurred from 1982 - 1989, phase 2
[AD-A276473] p 3574 N94-31246
MSAT boom joint testing and load absorber design p 3606 N94-33315
Load-limiting landing gear footpad energy absorption system p 3607 N94-33323
ENERGY BUDGETS
Controls on the CO2 seasonal cycle p 3950 N94-33227
ENERGY CONSERVATION
Gas dynamics for accretion disk simulations p 3932 N94-31144
The hydrogen hybrid option
[DE94-006733] p 3667 N94-32148
Renewable energy technology development at Sandia National Laboratories
[DE94-007734] p 3761 N94-32383
ENERGY CONSUMPTION
Greenhouse gas emission impacts of electric vehicles under varying driving cycles in various countries and US cities
[DE94-007647] p 3765 N94-32600
ENERGY CONVERSION
Room temperature molten salts for advanced energy conversion and storage
[AD-A277777] p 3763 N94-33015
ENERGY CONVERSION EFFICIENCY
High conversion efficiency pumped-cavity second harmonic generation of a diode laser
[DE94-006805] p 3717 N94-32134
A simple model for determining photoelectron-generated radiation scaling laws
[DE94-006130] p 3761 N94-32660
Polymer electrolyte fuel cells
[DE94-007558] p 3761 N94-32762
ENERGY DISSIPATION
Instrumentation for EXELFS measurements using convergent beam diffraction coupling to the electron energy loss spectrometer
[USIP-93-07] p 3858 N94-31084
Studying transient mobility and energy loss using scanning tunneling microscopy
[AD-A276292] p 3877 N94-31256
Observations of turbulence, internal waves and background flows: An inquiry into the relationships between scales of motion p 3705 N94-31988
Ion-irradiation-induced densification of zirconia sol-gel thin films
[DE94-006248] p 3656 N94-32103
The 10th International Conference on Internal Friction and Ultrasonic Attenuation in Solids (ICIFUAS)
[AD-A276849] p 3902 N94-32209
ENERGY DISTRIBUTION
Energy and angular distributions of secondary ions during electronic sputtering of nonconducting surfaces
[ETN-94-95756] p 3865 N94-31516
ENERGY GAPS (SOLID STATE)
GaAs/GaN strained layer superlattice materials for high temperature transistors, phase 1
[AD-A276115] p 3897 N94-31528
Photonic band gap materials
[DE94-005566] p 3677 N94-32101
Lowering the Schottky barrier at metal or silicide/Si interfaces to extend the range of infrared detectors
[AD-A277253] p 3903 N94-32322
Theoretical studies of electron transfer and optical spectroscopy
[DE94-006985] p 3871 N94-32375
ENERGY LEVELS
Near resonant absorption by atoms in intense fluctuating laser fields
[DE94-005873] p 3714 N94-31200
Spectroscopy and atomic physics in EBIT and SuperEBIT
[DE94-006050] p 3864 N94-31508
ENERGY METHODS
An approximate solution for interlaminar stresses in laminated composites p 3621 N94-31901

ENERGY POLICY
Current policies of the major countries coping with the global warming problem and-the energy demand and supply
[DE94-757291] p 3769 N94-32920
ENERGY SOURCES
Biomass power industry: Assessment of key players and approaches for DOE and industry interaction
[DE94-000238] p 3761 N94-32725
ENERGY SPECTRA
Design and characterization of a pulsed x ray source for fluorescent lifetime measurements
[DE94-007495] p 3880 N94-32138
ENERGY STORAGE
Solar lunar power p 3599 N94-31427
Metal hydrides in hydrogen energy systems
[VTT-TIED-1407] p 3759 N94-31655
NEMO: Advanced energy systems and technologies
[DE94-721996] p 3760 N94-31767
Nonlinear analysis of springs using helical finite elements p 3859 N94-31906
Development of silver-zinc cells of improved cycle life and energy density
[AD-A277311] p 3693 N94-32329
Energy storage specification requirements for hybrid-electric vehicle
[DE94-008642] p 3694 N94-32521
Flywheel Energy Storage Technology Workshop
[DE94-008064] p 3761 N94-32705
Room temperature molten salts for advanced energy conversion and storage
[AD-A277777] p 3763 N94-33015
ENERGY TECHNOLOGY
Solar resource: Utility load-matching assessment
[DE94-000297] p 3758 N94-31264
Laboratory Directed Research & Development Program
[DE94-005928] p 3956 N94-31523
NEMO: Advanced energy systems and technologies
[DE94-721996] p 3760 N94-31767
Renewable energy technology development at Sandia National Laboratories
[DE94-007734] p 3761 N94-32383
Sandia technology engineering and science accomplishments
[DE94-008312] p 3668 N94-32412
Solar activities at Sandia National Laboratories
[DE94-007737] p 3761 N94-32648
Flywheel Energy Storage Technology Workshop
[DE94-008064] p 3761 N94-32705
Biomass power industry: Assessment of key players and approaches for DOE and industry interaction
[DE94-000238] p 3761 N94-32725
ENERGY TRANSFER
Convective solar nebula p 3930 N94-31130
Vibrations of a heavy truck diesel engine and gearbox unit: Examining structure-borne sound transmission with statistical energy analysis
[CTH-E-93-04] p 3722 N94-31194
A fully two-dimensional, non-oscillatory advection scheme for momentum and scalar transport equations
[DM-66] p 3700 N94-31221
Numerical simulations of monsoon rainfall with the NRL/NCSU regional nested grid model
p 3782 N94-31791
Vibrational energy transfer of diatomic gases in hypersonic expanding flows p 3570 N94-31958
Transport phenomena in the Earth's plasma sheet
p 3772 N94-31970
Mechanisms of laser induced reactions in opaque heterogeneous environments
[AD-A276642] p 3717 N94-31996
Ion-irradiation-induced densification of zirconia sol-gel thin films
[DE94-006248] p 3656 N94-32103
Time-resolved IR spectroscopy, energy transfer, and state-to-state collision dynamics of atmospheric species
[AD-A277372] p 3773 N94-32338
Energy transfer properties and mechanisms
[DE94-007403] p 3636 N94-32594
ENGINE DESIGN
A numerical method for mixing/chemically reacting compressible flow with finite rate chemistry
p 3634 N94-31824
Mechanics of cracking for composite material
p 3624 N94-32501
Oscillating-flow loss test results in rectangular heat exchanger passages
[NASA-CR-185297] p 3615 N94-32792
A 1050 K Stirling space engine design
[NASA-CR-182149] p 3616 N94-32866
ENGINE FAILURE
Real-time sensor data validation
[NASA-CR-195295] p 3616 N94-33099
ENGINE INLETS
Inlet distortion in engines on VSTOL aircraft
[NASA-CR-195841] p 3584 N94-33035
Response of a cantilevered plate in supersonic flow
[AD-A277487] p 3580 N94-33107
ENGINE PARTS
Thermal-mechanical fatigue crack growth in aircraft engine materials
[ISBN-0-315-86543-1] p 3734 N94-31707
High temperature NASP engine seal development
[NASA-TM-109750] p 3725 N94-31804
Analysis of Navy aircraft engine and engine component warranties
[AD-A276936] p 3584 N94-32238
A user's manual for the cost effectiveness analysis spreadsheet model for aircraft engines (CEAMOD version 2.0)
[AD-A278042] p 3585 N94-33266
Analysis of intermediate level maintenance following F404-GE-400 engine component life reductions
[AD-A277918] p 3585 N94-33283
ENGINEERING
A facilitated mentoring process for engineers
[DE94-005823] p 3914 N94-32677
ENGINEERING MANAGEMENT
Managing customer order driven engineering. An interdisciplinary and design oriented approach
[PB94-145083] p 3917 N94-31583
ENGINEERS
A facilitated mentoring process for engineers
[DE94-005823] p 3914 N94-32677
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 12: The diffusion of federally funded aerospace research and development (R/D) and the information seeking behavior of US aerospace engineers and scientists
[NASA-TM-109404] p 3921 N94-32832
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 11: The voice of the user: How US aerospace engineers and scientists view DOD technical reports
[NASA-TM-109348] p 3921 N94-32834
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 1: The value of scientific and technical information (STI), its relationship to Research and Development (R/D), and its use by US aerospace engineers and scientists
[NASA-TM-109774] p 3922 N94-32835
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 25: The technical communications practices of British aerospace engineers and scientists: Results of the phase 4 RAeS mail survey
[NASA-TM-109098] p 3922 N94-32836
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 24: The technical communications practices of US aerospace engineers and scientists: Results of the phase 1 SAE mail survey
[NASA-TM-109088] p 3922 N94-32837
ENGRAVING
Laser applications in wood processing
[PB94-138567] p 3717 N94-31840
ENTHALPY
Strongly coupled ionic mixtures and the H/He EOS
[DE94-006391] p 3934 N94-31782
ENTROPY
Entropy, information (and image), part 1
[TELECOM-93-D-009] p 3910 N94-31098
Physical basis for climate change models
[DE94-003827] p 3767 N94-32712
ENTROPY (STATISTICS)
Dynamical entropy of generalized quantum Markov chains
[PB94-148483] p 3850 N94-31590
Probability distributions with given marginals and given correlation that have maximal entropy
[REPT-93-81] p 3851 N94-31698
ENVIRONMENT EFFECTS
LDEF Materials Results for Spacecraft Applications
[NASA-CP-3257] p 3591 N94-31012
Space Station WP-2 application of LDEF MLI results
p 3592 N94-31016
Modeling of LDEF contamination environment
p 3592 N94-31019
Concentration system performance degradation in the aftermath of Mount Pinatubo
[DE94-001879] p 3764 N94-31602
Evaluation of Fluorescence Line Imager (FLI) airborne imaging spectrometer data for roadside tree damage assessment p 3745 N94-31866
Greenhouse gas emission impacts of electric vehicles under varying driving cycles in various countries and US cities
[DE94-007647] p 3765 N94-32600
Fine resolution atmospheric sulfate model driven by operational meteorological data: Comparison with observations
[DE94-002994] p 3766 N94-32691
Identification of research relating to the critical loads concept and its potential application to the regulation of acidic deposition
[DE94-008234] p 3767 N94-32752
ENVIRONMENT MANAGEMENT
Information resources for US Department of Energy pollution prevention programs
[DE94-006677] p 3763 N94-31582
Mapping analysis and planning system for the John F. Kennedy Space Center p 3757 N94-32463
ENVIRONMENT MODELS
Modeling of the continental biosphere
p 3770 N94-31011
Model of spacecraft atomic oxygen and solar exposure microenvironments p 3593 N94-31021
Possible test of ancient dense Martian atmosphere
p 3947 N94-33206
ENVIRONMENT POLLUTION
NATO contributions to European environmental security
[AD-A275918] p 3763 N94-31275
Information systems to enhance technology exchange
[DE94-007744] p 3920 N94-32808
ENVIRONMENT PROTECTION
NATO contributions to European environmental security
[AD-A275918] p 3763 N94-31275
Evaluating success levels of mega-projects
p 3599 N94-31432
Strategies for survival in the new environmental era
[AD-A276827] p 3765 N94-32195
Environmental issues related to biomass: An overview
[DE94-007226] p 3767 N94-32784
Current policies of the major countries coping with the global warming problem and-the energy demand and supply
[DE94-757291] p 3769 N94-32920
ENVIRONMENTAL CHEMISTRY
The mineralogic evolution of the Martian surface through time: Implications from chemical reaction path modeling studies p 3950 N94-33226
Controls on the CO2 seasonal cycle
p 3950 N94-33227
ENVIRONMENTAL CONTROL
Atmosphere quality standards in manned space vehicles
[ESA-PSS-03-401-ISSUE-1] p 3802 N94-31224
Technical assessment of Mir-1 life support hardware for the international space station
[NASA-TM-108441] p 3803 N94-31380
ENVIRONMENTAL ENGINEERING
Atomic oxygen erosion considerations for spacecraft materials selection p 3593 N94-31022
Technical assessment of Mir-1 life support hardware for the international space station
[NASA-TM-108441] p 3803 N94-31380
ENVIRONMENTAL MONITORING
Global change research and NASA's Earth Observing System
[PB94-126992] p 3741 N94-31068
Analysis of GER imaging spectrometry data for the identification of soil and vegetation parameters in land degradation studies p 3744 N94-31857
Monitoring fertilizer application by imaging spectrometry (Somerset Levels test site) p 3745 N94-31863
A model geophysics program
[DE94-007415] p 3747 N94-32203
Mapping analysis and planning system for the John F. Kennedy Space Center p 3757 N94-32463
Research and applications of a canopy reflectance model p 3747 N94-32492
From Optics to Radar, SPOT and ERS Applications
[ISBN-2-85428-345-7] p 3747 N94-32523
The complementary nature of the SPOT and ERS-1 systems and their place in major international programmes p 3748 N94-32524
From optics to radar: Environmental problems and the SPOT/ERS systems p 3748 N94-32525
Feasibility in the use of satellite remote sensing data as a fast reaction tool for natural disaster relief
p 3748 N94-32526
Contribution of SAR ERS1 data to study the French Guiana tropical coast environment
[BRGM-93034] p 3748 N94-32527
A case study comparing multi-temporal ERS-1 SAR data and SPOT data for tropical forest mapping
p 3753 N94-32556
Ocean variability and its influence on the detectability of greenhouse warming signals
[DE94-008670] p 3790 N94-32881

ENVIRONMENTAL SURVEYS
National US public policy on global warming derived from optimization of energy use and environmental impact studies
[DE94-004606] p 3768 N94-32790
Real-time centimeter positioning with GPS: A system developed by the US Army Corps of Engineers
[AD-A278152] p 3577 N94-33095
Cruise report: Oceanus 250 leg 4 high resolution profiler survey for the North Atlantic Tracer Release Experiment, 25 March - 24 April, 1992
[AD-A277935] p 3791 N94-33245
ENVIRONMENTAL TESTS
Atomic oxygen erosion considerations for spacecraft materials selection p 3593 N94-31022
Performance of selected polymeric materials on LDEF p 3593 N94-31023
Fluorescence observations of LDEF exposed materials as an indicator of induced material reactions p 3593 N94-31025
Laser-induced fluorescence of space-exposed polyurethane p 3593 N94-31026
On the linearity of fast atomic oxygen effects p 3594 N94-31027
Effects of orbital exposure on RTV during the LDEF mission p 3597 N94-31043
What LDEF means for development and testing of materials p 3598 N94-31050
Aerospace test facilities at NASA LERC Plumbrook
[NASA-TM-109755] p 3602 N94-31814
Validation of the Environmentally Conscious Manufacturing Integrated Demonstration hardware
[DE94-003824] p 3765 N94-32144
Accelerated reliability testing utilizing design of experiments
[AD-A277989] p 3732 N94-33088
ENZYME ACTIVITY
Biocatalytic processing polymers in supercritical fluids
[AD-A276120] p 3651 N94-31510
The sol-gel-xerogel transition
[AD-A276647] p 3616 N94-32038
Ninth International Workshop on Plant Membrane Biology
[DE94-005690] p 3794 N94-32769
ENZYMES
Biocatalytic processing polymers in supercritical fluids
[AD-A276120] p 3651 N94-31510
EPHEMERIDES
Possible improvements of satellite ephemeris programs used in geodesy
[PB94-148681] p 3743 N94-31592
EPIDEMIOLOGY
The legacy of Kermack and McKendrick
[CWI-AM-R9304] p 3793 N94-32228
EPITAXY
GaAs/GaN strained layer superlattice materials for high temperature transistors, phase 1
[AD-A276115] p 3897 N94-31528
Semiconductor microcavity lasers
[DE94-006143] p 3716 N94-31622
In-situ TEM crystallization of anorthite-glass films on (alpha)-Al2O3
[DE94-006317] p 3652 N94-31780
Epitaxial liftoff technology onto processed silicon foundry wafers
[AD-A277116] p 3900 N94-31985
The charging effect in high-Tc superconducting thin films
[AD-A277265] p 3900 N94-32040
Correlations between micromagnetic, microstructural and microchemical properties in ultrathin epitaxial magnetic structures
[AD-A277200] p 3901 N94-32092
Stability and precipitation kinetics in Si(1-y)C(y)/Si and Si(1-x-y)Ge(x)C(y)/Si heterostructures prepared by solid phase epitaxy
[DE94-006589] p 3902 N94-32296
Heteroepitaxial diamond growth
[AD-A277178] p 3902 N94-32306
Energetics, bonding mechanism, and electronic structure of ceramic/ceramic and metal/ceramic interfaces
[DE94-008551] p 3659 N94-32656
Ab initio study of the epitaxial growth of Ge on Si(100) surface
[DE94-007245] p 3904 N94-32724
Microanalytical study of defect formation in thin bismuth strontium calcium copper oxide films
[DE94-008217] p 3661 N94-32751
The 6th International Conference on Modulated Semiconductor Structures
[AD-A276815] p 3906 N94-32908
Low energy ion beam assisted growth of homoepitaxial silicon films at low temperature
[AD-A278092] p 3908 N94-33039
Microstructures and epitaxy in oxide superconductor thin films and devices
[AD-A278427] p 3910 N94-33332
EPOXY COMPOUNDS
Reactions of electrophilic maleic anhydride and epoxy groups with nucleophilic functionalities such as carboxyl, hydroxyl, and amine groups. Polymer Technology Publication series no. 16
[PB94-135589] p 3648 N94-31069
Photopolymerization of cyclohexene oxide: A visible light initiating system and mechanistic investigations
[AD-A277110] p 3654 N94-31981
EPOXY MATRIX COMPOSITES
Performance of selected polymeric materials on LDEF p 3593 N94-31023
Micromechanical analysis of the interface and basic damage modes in glass fiber/epoxy resin model composites
[ONERA-NT-1993-4] p 3618 N94-31225
Fatigue behavior of unidirectional pultruded composite materials
[ISBN-0-315-86425-7] p 3621 N94-31719
Evaluating in-plane elastic constants of damaged carbon-epoxy laminates using a quantitative ultrasonic technique p 3621 N94-31793
EPOXY RESINS
Design of new polymers to improve radiation stability of plastic scintillators
[DE94-008220] p 3652 N94-31764
Hydrogen peroxide electrodes based on electrical connection of redox centers of various peroxidases to electrodes through a three-dimensional electron relaying polymer network
[AD-A276543] p 3691 N94-32056
EQUALIZERS (CIRCUITS)
Kalman filtering approach to blind equalization
[AD-A276320] p 3671 N94-31299
EQUATIONS OF MOTION
General-relativistic celestial mechanics. 4: Theory of satellite motion
[PB94-147782] p 3601 N94-31769
Design and Monte Carlo analysis of an unmanned aerial vehicle
[AD-A277648] p 3580 N94-33056
Identification and control of structures in space
[NASA-CR-195910] p 3612 N94-33115
EQUATIONS OF STATE
Strongly coupled ionic mixtures and the H/He EOS
[DE94-006391] p 3934 N94-31782
Analytic properties of the OCP and ionic mixtures in the strongly coupled fluid state
[DE94-008216] p 3637 N94-32801
EQUATORIAL ELECTROJET
Theoretical studies on ionospheric irregularities and ion diode performance
[AD-A277115] p 3772 N94-31984
EQUATORIAL ORBITS
Testing for preferred-frame effects in gravity with artificial Earth satellites
[PB94-148459] p 3610 N94-31771
EQUATORIAL REGIONS
Low frequence variability of the ocean atmosphere coupled system p 3777 N94-30986
EQUILIBRIUM FLOW
The effect of an axial flow component on a circular cylinder wake p 3699 N94-31209
EQUIPMENT SPECIFICATIONS
An application reference model for layered manufacturing
[DE94-006368] p 3811 N94-31484
Design, performance, and test standards for flight termination receivers/decoders. Volume 1: Design and performance requirements
[AD-A277245] p 3602 N94-32333
The Los Alamos National Laboratory precision double crystal spectrometer
[DE94-008075] p 3713 N94-32706
EQUIPOTENTIALS
World height system definition and implementation
[AD-A276725] p 3747 N94-32160
EQUIVALENCE
On the equivalence of Lambek categorial grammars and basic categorial grammars
[LP-93-07] p 3842 N94-31451
ERBIUM
Electron spin resonance measurements of Er(3+) and Mn(2+) in the high temperature superconductor compounds La(2-x)Sr(x)CuO(4-delta)
[ETN-94-95746] p 3898 N94-31612
ERGODIC PROCESS
A note on cocycles in a semidirect product
[REPT-93-65] p 3851 N94-31661
Adaptive control of nonlinear and stochastic systems
[AD-A278411] p 3839 N94-33325
EROSION
Space Station WP-2 application of LDEF MLI results p 3592 N94-31016
Follow-up on the effects of the space environment on UHCRE thermal blankets p 3592 N94-31018
Atomic oxygen erosion considerations for spacecraft materials selection p 3593 N94-31022
On the linearity of fast atomic oxygen effects p 3594 N94-31027
Impact of LDEF photovoltaic experiment findings upon spacecraft solar array design and development requirements p 3594 N94-31028
Robotic weld overlay coatings for erosion control
[DE94-008004] p 3658 N94-32408
Geologic controls of erosion and sedimentation on Mars p 3951 N94-33232
Obliquity variation in a Mars climate evolution model p 3951 N94-33236
ERROR ANALYSIS
The generalized multi delay adaptive filter: Structure and convergence analysis
[TELECOM-93-D-004] p 3808 N94-31094
A comparison of predictors for first-guess wind speed errors
[AD-A276460] p 3781 N94-31239
A review of sensitivity analysis techniques
[DE94-007192] p 3842 N94-31399
Direct-sequence spread-spectrum performance in a multipath fading environment
[AD-A276080] p 3673 N94-31464
Regional sources of error growth in the National Meteorological Center's medium-range forecast model p 3781 N94-31554
Error analysis of real-time and post-processed orbit determination for the Geosat Follow-On altimetric satellite using GPS tracking p 3576 N94-31845
On the error committed by stopping the Newton iteration in Runge-Kutta methods and linear multistep methods
[TW-93-13] p 3847 N94-32206
Eta percent-superconvergence in the interior of locally refined meshes of quadrilaterals: Superconvergence of the gradient in finite element solutions of Laplace's and Poisson's equations
[AD-A277242] p 3848 N94-32331
Thermospheric modeling accuracies using F10.7 and Ap
[AD-A277355] p 3773 N94-32337
Finite element solution to the Helmholtz equation with high wave number. Part 1: The h-version of the FEM
[AD-A277396] p 3848 N94-32341
Note on the variance of autospectral density processed using Welch's method
[DE94-005352] p 3849 N94-32675
Aspects of modeling uncertainty and prediction
[DE94-007565] p 3852 N94-32744
ERROR CORRECTING CODES
Model-based reconfiguration: Diagnosis and recovery
[NASA-CR-4596] p 3820 N94-32776
ERROR DETECTION CODES
Consistency checks for SCR-style requirements specifications
[AD-A276077] p 3811 N94-31461
On the implementation of error handling in dynamic interfaces to scientific codes
[DE94-008970] p 3818 N94-32585
Model-based reconfiguration: Diagnosis and recovery
[NASA-CR-4596] p 3820 N94-32776
ERRORS
Multiple regression and measurement errors: Relative efficiency of two models, the standard model and Fuller's model, for estimating structural relationships
[ISBN-0-315-86834-1] p 3845 N94-31755
Principal component analysis with missing data and its application to object modeling
[AD-A276644] p 3845 N94-31939
On the relationship between generalization error, hypothesis complexity, and sample complexity for radial basis functions
[AD-A276802] p 3851 N94-32142
Bounds on least-squares four-parameter sine-fit errors due to harmonic distortion and noise
[DE94-007859] p 3849 N94-32653
ERS-1 (ESA SATELLITE)
From Optics to Radar, SPOT and ERS Applications
[ISBN-2-85428-345-7] p 3747 N94-32523
The complementary nature of the SPOT and ERS-1 systems and their place in major international programmes p 3748 N94-32524
From optics to radar: Environmental problems and the SPOT/ERS systems p 3748 N94-32525
Contribution of SAR ERS1 data to study the French Guiana tropical coast environment
[BRGM-93034] p 3748 N94-32527
Optics and radar: Cohabitation, rivality or happy marriage. Towards new planning tools p 3748 N94-32529

The use of ERS images for mapping
p 3749 N94-32531
Assessment of region-based methods for automated SAR/optical registration, attribute extraction, and classification p 3750 N94-32536
Robust multisource classification method using the Markov random field methods p 3750 N94-32537
Technique of ERS-1 image processing in association with SPOT data p 3750 N94-32538
Production of terrain data: Optical radar complementarity p 3750 N94-32540
Fusion of multispectral (XS) and Panchromatic (P) SPOT images and radar images p 3750 N94-32541
Ship traffic monitoring and oil spill detection using the ERS-1 SAR p 3751 N94-32542
SAR image feature extraction system: A pre-operational application of ERS-1 SAR p 3751 N94-32543
The use of ERS-1 within an operational ice monitoring program p 3751 N94-32545
The use of SPOT and ERS-1 images to map the eruption of Nevado Sabancaya (Province of Arequipa, South Peru) and evaluate associated risks p 3751 N94-32546
Comparison of SPOT, ERS-1, SEASAT, LANDSAT TM, and merged imagery for geological investigations
p 3752 N94-32547
Optimal geological data extraction from SPOT-radar synergism with samples from Djebel Amour (Algeria), Red Sea Hills (Sudan), Sirte Basin (Libya), and Magdalena Valley (Colombia) p 3752 N94-32548
Respective contributions of VIS-PIR, SAR-ERS 1, and airborne radar data for morphostructural and morphoneotectonic analysis: Practical examples
p 3752 N94-32549
Use of SPOT and ERS-1 SAR data to study the tectonic and climatic history of arid regions p 3752 N94-32550
Structural study in an alteritic region: Contribution of ERS-1 SAR data of the Mauges Plateau (Loire Atlantique, France)
[BRGM-93032] p 3752 N94-32551
Study of subpolar glaciers of Spitzbergen using SPOT, ERS-1, and hypsometric data: Results and perspectives
p 3753 N94-32553
Integration of ERS-1 images into the European Agriculture Statistics project Action 4: Thematic aspect
p 3753 N94-32554
Use of SPOT and ERS-1 to map tropical vegetation and mangrove dynamics in Guiana p 3753 N94-32555
A case study comparing multi-temporal ERS-1 SAR data and SPOT data for tropical forest mapping
p 3753 N94-32556
Application of ERS-1 SAR data for hydrological studies p 3754 N94-32558
Monitoring landsurface characteristics in Niger using complementary SPOT and ERS-1 SAR data
p 3754 N94-32560
European MARS project: The potential integration of SPOT and air- and satellite-borne radar data over two pilot areas for agricultural statistics. PROSPER programme and ERS-1 pilot project
[BRGM-93035] p 3754 N94-32561
Possible complementarity of SPOT/ERS in mapping land use: Study on agricultural land in Brittany (France)
p 3755 N94-32563
Land cover change detection with ERS-1 data and data from other remote sensing satellites. Example: The delta of the River Ebro (Spain) p 3755 N94-32564
ERS-1 SAR and optical data for land use/land cover mapping: A case study in a savannah zone of Guinea
p 3755 N94-32565
SAR interferometry with ERS-1 p 3755 N94-32566
Techniques and applications of SAR interferometry for ERS-1 p 3756 N94-32568
Developments in ERS-1 SAR interferometry: Use of the spectral shift p 3756 N94-32569
Differential interferometry study of an earthquake
p 3756 N94-32570
Precision and level of artefacts in the computation of digital terrain models by interferometry
p 3756 N94-32571
Fields of experiments in ERS-1 SAR interferometry in Bonn and Naples p 3756 N94-32572

ESSENTIALLY NON-OSCILLATORY SCHEMES
A numerical method for mixing/chemically reacting compressible flow with finite rate chemistry
p 3634 N94-31824

ESTERS
Metal ion complexation by ionizable crown ethers
[DE94-008301] p 3661 N94-32847
Interpenetrating polymer network acoustic damping material
[AD-D016141] p 3663 N94-32975
Development and preliminary evaluation of aryl ester boundary additives for perfluoropolyethers
[NASA-TM-106603] p 3663 N94-33024

ESTIMATES
Initial estimates of Integrated Maintenance Information System (IMIS) costs and benefits, volume 1
[AD-A276144] p 3565 N94-31830
Kaplan-Meier estimators of interpoint distance distributions for spatial point processes
[CWI-BS-R9315] p 3846 N94-32107

ESTIMATING
Estimating the impact of crashworthiness standards on mortality and morbidity events in the US Army rotary-wing aircraft mishaps
[AD-A277121] p 3575 N94-32363

ESTUARIES
ADCIRC: An advanced three-dimensional circulation model for shelves, coasts, and estuaries. User's manual for ADCIRC-2DDI
[AD-A276150] p 3787 N94-31250

ETCHING
Ionization probes of molecular structure and chemistry
[DE94-007605] p 3872 N94-32643

ETHANE
Time-resolved infrared absorption studies applied to the study of radical plus molecule reactions
[DE94-005921] p 3863 N94-31202

ETHERS
Fuel property effects on engine combustion processes
[DE94-005529] p 3631 N94-31153
Silicone grease as a precursor to a pseudo crown-ether ligand: Crystal structure of (K(+)K(Me2SiO)7(+))(HIn(CH2CMe3)3(-))4)
[AD-A276343] p 3895 N94-31327
High octane ethers from synthesis gas-derived alcohols
[DE94-006774] p 3667 N94-32133
The intramolecular cyclization of bis-2,5-dimethylene-2,5-dihydrofurans and bis-2,5-dimethylene-2,5-dihydrothiophenes: An approach to macrocycles
[DE94-007060] p 3657 N94-32377
Metal ion complexation by ionizable crown ethers
[DE94-008301] p 3661 N94-32847

ETHICS
Ethics and rationality in information-enriched decisions: A model for technical communication
[DE93-040251] p 3681 N94-32679

ETHYL ALCOHOL
Preparation of catalyst particles using methods of colloid chemistry. Part 1: Preparation of silica particles from alcohol solutions
[PB94-135597] p 3634 N94-31679
Stabilized alumina/ethanol colloidal dispersion for seeding high temperature air flows
[NASA-TM-106591] p 3713 N94-32983

ETHYL COMPOUNDS
Microstructure of copolymers containing disperse red 1 and methyl methacrylate
[AD-A277140] p 3660 N94-32722

ETHYLENE
Direct aromatization of methane
[DE94-008719] p 3638 N94-32888
Evaluation of pyrolysis and arc tracking on candidate wire insulation designs for space applications
[NASA-CR-195332] p 3731 N94-32901

ETIOLOGY
Muscle disuse through tail-suspension: Etiology and therapeutics p 3796 N94-31746

EUCLIDEAN GEOMETRY
Strictly positive definite functions on spheres
[AD-A276471] p 3855 N94-31244

EULER EQUATIONS OF MOTION
An adaptive method for the exact resolution of shock waves and contact discontinuities
[ISBN-0-315-86498-2] p 3704 N94-31799
A new inverse method for generating high-speed aerodynamic flows with application to waverider design
p 3569 N94-31828

EUROPE
European business confronted with the 21st century: Men, the essential risk
[ESA-SP-1167] p 3914 N94-31181
Europe at the crossroads: The future of its satellite communications industry
[ESA-SP-1166] p 3670 N94-31182
Analysis of ionospheric parameters in Europe and creation of the prediction algorithm
[AD-A276342] p 3771 N94-31326
Current Research Information in Europe: Conference proceedings
[PB94-127933] p 3917 N94-31768
The European Imaging Spectroscopy Airborne Campaign (EISAC). Data takes and evaluation programme: An overview p 3743 N94-31854
Integration of ERS-1 images into the European Agriculture Statistics project Action 4: Thematic aspect
p 3753 N94-32554
Rapid estimates of crop acreage and production at European scale using high resolution imagery
p 3754 N94-32557

EUROPEAN SPACE AGENCY
Guide to software quality assurance
[ESA-PSS-05-11-ISSUE-1] p 3809 N94-31223

EUROPEAN SPACE PROGRAMS
From optics to radar: Environmental problems and the SPOT/ERS systems p 3748 N94-32525

EUROPIUM COMPOUNDS
Low dispersion of the muon precession frequency in HTSC samples YBa2Cu3O(x) and EuBa2Cu3O(x)
[DE94-608388] p 3896 N94-31395

EUTECTICS
Compositions and chemical bonding in ceramics by quantitative electron energy-loss spectrometry
[DE94-007208] p 3659 N94-32640
The relative performance of FeS2 and CoS in long-life thermal-battery applications
[DE94-006145] p 3695 N94-32663

EVACUATING (TRANSPORTATION)
Technical evaluation of the UH-60Q: Aircraft in typical aeromedical evacuation missions
[AD-A276944] p 3586 N94-32217

EVALUATION
Evaluating success levels of mega-projects
p 3599 N94-31432
The European Imaging Spectroscopy Airborne Campaign (EISAC). Data takes and evaluation programme: An overview p 3743 N94-31854

EVAPORATION
The ocean-atmosphere interactions in the Mediterranean Sea p 3779 N94-30995
Thermocapillary convection in evaporating sessile drops
[NASA-TM-109758] p 3705 N94-31886
Recurvature dynamics of a typhoon
[AD-A276792] p 3784 N94-32164
Synergy of thermal infrared and microwave remote sensing for evaporation estimation p 3754 N94-32559

EVOKED RESPONSE (PSYCHOPHYSIOLOGY)
Stress-induced enhancement of the startle reflex
[AD-A278414] p 3802 N94-33327

EVOLUTION (DEVELOPMENT)
Experiences with EDO: An Evolutionary Database Optimizer
[TR-93-23] p 3918 N94-32105
Information disclosure in evolving information systems: Taking a shot at a moving target
[TR-93-22] p 3919 N94-32506

EXCIMER LASERS
Diagnostics of high-brightness short-pulse lasers and the plasmas they generate
[DE94-006165] p 3716 N94-31624
Short-pulse, high-intensity lasers at Los Alamos
[DE94-007545] p 3720 N94-32760
Nucleation and growth of cubic boron nitride films produced by ion-assisted pulsed laser deposition
[DE94-007295] p 3661 N94-32796

EXCIMERS
Production and detection of metastable atomic oxygen
[ISBN-0-315-87364-7] p 3868 N94-31915

EXCITATION
Intramolecular charge transfer complexes as fluorescence probes for UV and visible light induced acrylate polymerization
[AD-A277129] p 3657 N94-32381
Conjugated polymer fluorescence: Interplay of correlations and alternation
[DE94-005587] p 3660 N94-32729
Bioluminescence bathyphotometer
[AD-D016102] p 3790 N94-32959
Simultaneous excitation of parametric decay cascades and the OTSI in 1D numerical simulations based on Aakarov's equations
[AD-A278108] p 3893 N94-33042

EXCITONS
Temperature dependence of the exciton-exciton annihilation rate constant in poly(di-n-hexylsilane)
[DE94-005584] p 3655 N94-32102

EXHAUST EMISSION
Control and monitoring of heavy metal emissions
[VTT-TIED-1508] p 3765 N94-31657
Evaluation of Fluorescence Line Imager (FLI) airborne imaging spectrometer data for roadside tree damage assessment p 3745 N94-31866
Greenhouse gas emission impacts of electric vehicles under varying driving cycles in various countries and US cities
[DE94-007647] p 3765 N94-32600

EXHAUST GASES
Greenhouse gas emission impacts of electric vehicles under varying driving cycles in various countries and US cities
[DE94-007647] p 3765 N94-32600

Possible effect of the chlorine oxide dimer on transient ozone loss in rocket plumes
[AD-A278135] p 3616 N94-33094

EXHAUST NOZZLES
Computational study of single-expansion-ramp nozzles with external burning
[NASA-TM-106550] p 3700 N94-31229
Combustor and nozzle effects on particulate behavior in solid rocket motors
[AD-A277304] p 3614 N94-32071

EXOBIOLOGY
Aerospace medicine and biology: A continuing bibliography with indexes (supplement 388)
[NASA-SP-7011(388)] p 3795 N94-31414
Aerospace medicine and biology: A continuing bibliography with indexes (supplement 389)
[NASA-SP-7011(389)] p 3797 N94-32347
Aerospace medicine and biology: A continuing bibliography with indexes (supplement 385)
[NASA-SP-7011(385)] p 3797 N94-32348

EXOSPHERE
Escape of Mars atmospheric carbon through time by photochemical means p 3948 N94-33214

EXPERIMENT DESIGN
Tearing resistance of a thin shell against projectile penetration: Material property effects
[DE94-007466] p 3733 N94-31316
Accelerated reliability testing utilizing design of experiments
[AD-A277989] p 3732 N94-33088

EXPERT SYSTEMS
Evaluation of HardSys/HardDraw, an expert system for electromagnetic interactions modelling
[AD-A276218] p 3670 N94-31063
Information acquisition from multi-agent resources; abstract
[LP-93-08] p 3917 N94-31452
Module generation for self-testing integrated systems
[ISBN-9-09-004570-8] p 3688 N94-31520
LORE and reason maintenance
[REPT-93-88] p 3812 N94-31522
An expert system architecture for heterogeneous domains: A case-study in the legal field
[ETN-94-96012] p 3830 N94-31546
Hierarchical mixtures of experts and the EM algorithm
[AD-A276516] p 3814 N94-31932
Mapping analysis and planning system for the John F. Kennedy Space Center p 3757 N94-32463
An intelligent interactive visual database management system for Space Shuttle closeout image management p 3923 N94-32469
The limits of intelligence in design
[DE94-004668] p 3819 N94-32668
Spacecraft environmental anomalies expert system
[AD-A277962] p 3612 N94-33262
Proceedings of the Symposium/Workshop on Applications of Expert Systems in DND
[DSIS-93-00343] p 3853 N94-33335
Scheduling fighter missions using an expert system with an operations research module p 3853 N94-33337
The CF-18 diagnostic and maintenance expert system project p 3567 N94-33338
An expert system application for troubleshooting the CF18 F404 engine p 3585 N94-33339
A diagnostic expert system for digital circuits p 3699 N94-33340
Management of uncertainty in knowledge-based systems: A military perspective p 3854 N94-33341
Knowledge engineering for PACES, the particle accelerator control expert system p 3854 N94-33342
The hypermedia technology as front end to knowledge processing systems p 3854 N94-33343
A problem-solving approach to knowledge acquisition p 3854 N94-33344
A heuristic multiple target tracker p 3686 N94-33346

EXPLOSIONS
Fireworks in velocity and configuration space applied to cosmology
[USIP-93-90] p 3927 N94-31086
Using Monte Carlo techniques and parallel processing for debris hazard analysis of rocket systems
[DE94-007250] p 3609 N94-31382
Analysis of forward and inverse problems in chemical dynamics and spectroscopy
[DE94-007607] p 3635 N94-32140

EXPLOSIVES
PVDF pressure transducers for shock wave and explosives research
[AD-A277319] p 3712 N94-32051

EXPONENTIAL FUNCTIONS
Stirling's formula and approximations for n(factorial) and the middle ratio
[REPT-93-73] p 3843 N94-31642

EXPONENTS
Comparing models of the non-extensional typed lambda-calculus
[ML-93-19] p 3842 N94-31409

EXPOSURE
Performance of silvered Teflon (trademark) thermal control blankets on spacecraft p 3591 N94-31014
Physical properties of glasses exposed to Earth-facing and trailing-side environments on LDEF p 3594 N94-31030
Summary of materials and hardware performance on LDEF p 3595 N94-31037
Characterization of polymer decomposition products by laser desorption mass spectrometry p 3597 N94-31046
Controlling hazardous energy sources (lockout/tagout)
[NASA-TM-105290] p 3669 N94-32861
Effect of elevated temperature and cyclic loading on properties and damage modes in ceramic composites
[DE94-008736] p 3662 N94-32891
Exposure assessment of JAVELIN missile combustion products
[AD-A278128] p 3616 N94-33059

EXTERNAL STORE SEPARATION
Six degree of freedom flight dynamic model of a Mk-82 store
[AD-A277065] p 3580 N94-32362

EXTERNAL STORES
Six degree of freedom flight dynamic model of a Mk-82 store
[AD-A277065] p 3580 N94-32362

EXTINCTION
A model of concurrent flow flame spread over a thin solid fuel p 3634 N94-31795

EXTINGUISHING
Influence of carbon dioxide on electronic equipment: Fire extinguishing with low concentration
[PB94-148749] p 3691 N94-31848

EXTRACTION
High-temperature study of O+H2CO yields OH+HCO
[DE94-006837] p 3864 N94-31321
Time-resolved analytical methods for liquid/solid interfaces
[DE94-008352] p 3637 N94-32826

EXTRAPOLATION
Evaluating success levels of mega-projects p 3599 N94-31432
Computer modelling of cyclic deformation of high-temperature materials
[AD-A277056] p 3623 N94-32012
A new method for calculating wing along aerodynamics to angle of attack 180 deg
[AD-A277965] p 3574 N94-33263

EXTRATERRESTRIAL INTELLIGENCE
The quest for contact
[NASA-TM-109778] p 3806 N94-32389

EXTRATERRESTRIAL LIFE
Mars: Five views on what is known
[NASA-TM-109751] p 3942 N94-31805

EXTRATERRESTRIAL RADIO WAVES
Plasma and radio waves from Neptune: Source mechanisms and propagation
[NASA-CR-195877] p 3943 N94-33103

EXTRAVEHICULAR ACTIVITY
The Nomad Explorer assembly assist vehicle: An architecture for rapid global extraterrestrial base infrastructure establishment p 3599 N94-31429
Energy absorber for the CETA p 3604 N94-33303

EXTRAVEHICULAR MOBILITY UNITS
Metal hydride heat pump engineering demonstration and evaluation model
[NASA-CR-188286] p 3669 N94-32857

EXTREME ULTRAVIOLET EXPLORER SATELLITE
Design and performance of the telescope and detector covers on the Extreme Ultraviolet Explorer satellite p 3605 N94-33309

EXTREME ULTRAVIOLET RADIATION
Extreme ultraviolet opacity sources in the DA white dwarf G191-B2B p 3924 N94-31210
Simplified ultra-high resolution optic for soft x ray imaging
[AD-A278424] p 3885 N94-33331

EYE MOVEMENTS
Analysis of pursuit tracking eye movements in pilots and nonfliers
[AD-A276597] p 3799 N94-32035

F

F REGION
Diurnal, seasonal and solar activity variations of F-region parameters
[AD-A278106] p 3776 N94-33285

F 2 REGION
Analysis of ionospheric parameters in Europe and creation of the prediction algorithm
[AD-A276342] p 3771 N94-31326

F-111 AIRCRAFT
Real time character recognition for F-111C video tape records
[AD-A277061] p 3580 N94-32263

F-16 AIRCRAFT
Initial estimates of Integrated Maintenance Information System (IMIS) costs and benefits, volume 1
[AD-A276144] p 3585 N94-31830

F-18 AIRCRAFT
Noise cancellation for CELP voice encoders in an F/A-18 noise environment
[AD-A277652] p 3683 N94-33026
Installed F/A-18 inlet flow calculations at 30 degrees angle-of-attack: A comparative study
[NASA-CR-195297] p 3573 N94-33119
Scheduling fighter missions using an expert system with an operations research module p 3853 N94-33337
An expert system application for troubleshooting the CF18 F404 engine p 3585 N94-33339

FABRICATION
Automated solar cell assembly teamed process research
[DE94-000295] p 3759 N94-31279
Fractional-factorial process development techniques
[DE94-005580] p 3690 N94-31593
The charging effect in high-Tc superconducting thin films
[AD-A277265] p 3900 N94-32040
Silicon-Film(tm) photovoltaic manufacturing technology
[DE94-000202] p 3760 N94-32143
A solar array module fabrication process for HALE solar electric UAVs
[DE94-006212] p 3760 N94-32174
Analytical Design Package (ADP2): A computer aided engineering tool for aircraft transparency design p 3823 N94-32430
Optical processing for semiconductor device fabrication p 3885 N94-32445
Flexible manufacturing for photonics device assembly p 3669 N94-32449
Fabrication, phase transformation studies and characterization of SiC-AlN-Al2OC ceramics
[DE94-008587] p 3659 N94-32657
Innovative fabrication processing of advanced composite materials concepts for primary aircraft structures
[NASA-CR-189558] p 3626 N94-32877
Effect of elevated temperature and cyclic loading on properties and damage modes in ceramic composites
[DE94-008736] p 3662 N94-32891
Enhanced thermal capacity aerogels summary report, FY 1993
[DE94-008888] p 3639 N94-33260

FABRICS
Space environment durability of beta cloth in LDEF thermal blankets p 3591 N94-31015
Space Station WP-2 application of LDEF MLI results p 3592 N94-31016

FABRY-PEROT INTERFEROMETERS
Study of the dynamics of a nonlinear coupled-cavity laser system
[ISBN-0-315-86717-5] p 3716 N94-31748

FACTOR ANALYSIS
Development of phase-only filters for sensor imagery
[AD-A276722] p 3880 N94-32151
Multidimensional scaling of user information satisfaction
[AD-A277230] p 3920 N94-32633
Torque characteristics of solid lubricated precision bearings during oscillatory motion
[AD-A278133] p 3728 N94-33061

FACTORIAL DESIGN
Fractional-factorial process development techniques
[DE94-005580] p 3690 N94-31593
Accelerated reliability testing utilizing design of experiments
[AD-A277989] p 3732 N94-33088

FACTORIALS
Stirling's formula and approximations for n(factorial) and the middle ratio
[REPT-93-73] p 3843 N94-31642

FACTORIZATION
A paraperspective factorization method for shape and motion recovery
[AD-A276513] p 3712 N94-31929
Recursive analysis of matrix scattering functions
[AD-A277264] p 3845 N94-32018

FAIL-SAFE SYSTEMS
Quench detection and instrumentation for the Tokamak Physics Experiment magnets
[DE94-006656] p 3888 N94-31667

Deployable and retractable telescoping tubular structure development p 3607 N94-33317

FAILURE

Experimental measurement of dynamic failure and fragmentation properties of metals [DE94-007377] p 3737 N94-32135

Nonlocal theory for fracturing of quasibrittle materials [AD-A278283] p 3740 N94-33143

Pip pin reliability and design p 3605 N94-33305

FAILURE ANALYSIS

Performance predictions for composite materials [AD-A276451] p 3618 N94-31261

Optimization of composite material failure loads [ISBN-0-315-87214-4] p 3621 N94-31836

Computer modelling of cyclic deformation of high-temperature materials [AD-A277056] p 3623 N94-32012

Benchmarking of the state-of-the-art in nondestructive testing/evaluation for applicability in the Composite Armored Vehicle (CAV) Advanced Technology Demonstrator (ATD) program, phase 1 [AD-A276660] p 3730 N94-32088

The advent of failure analysis software technology [DE94-006593] p 3692 N94-32111

Novel failure analysis techniques using photon probing with a scanning optical microscope [DE94-006594] p 3692 N94-32112

Honeycomb sandwich structures: Vented versus unvented designs for space systems [AD-A276713] p 3624 N94-32122

Mechanics of failure of high temperature metal matrix composites [AD-A277397] p 3624 N94-32342

Torque characteristics of solid lubricated precision bearings during oscillatory motion [AD-A278133] p 3728 N94-33061

Technology integration box beam failure study p 3628 N94-33126

FAILURE MODES

Unidirectional composites compressive behaviour: Test methods and micromechanical approach [ONERA-NT-1993-10] p 3618 N94-31232

The advent of failure analysis software technology [DE94-006593] p 3692 N94-32111

A review of weldment failure modes and weldability testing methods [AD-A278096] p 3729 N94-33251

FAINT OBJECTS

Digital image profilers for detecting faint sources which have bright companions [NASA-CR-191348] p 3927 N94-32695

FAR FIELDS

Micromechanics and effective properties of particulate composites and fluid suspensions p 3703 N94-31744

Experimental and computational studies on propeller noise due to inflow distortion p 3860 N94-31846

Using TSAR with the post-processing far-field option [DE94-006615] p 3679 N94-32188

Particle-In-Cell (PIC) code simulation results and comparison with theory scaling laws for photoelectron-generated radiation [DE94-006132] p 3695 N94-32662

FAR INFRARED RADIATION

High precision moving magnet chopper for variable operation conditions p 3605 N94-33307

FAR ULTRAVIOLET RADIATION

Ground-based simulation of LEO environment: Investigations of a select LDEF material: FEP Teflon (trademark) p 3596 N94-31039

FARM CROPS

High resolution spectroscopy in agriculture: Results of the EISAC 1989 campaign p 3745 N94-31864

Extraction of agricultural parameters from imaging-spectrometry data and simulated MERIS data through red edge analysis p 3745 N94-31865

FAST FOURIER TRANSFORMATIONS

An efficient three-dimensional Poisson solver for SIMD high-performance-computing architectures p 3823 N94-31120

Atmospheric structure simulation: An autoregressive model for smooth geophysical power spectra with known autocorrelation function [AD-A276691] p 3773 N94-32118

FAST NEUTRONS

Defect cascades produced by neutron irradiation in YBa2Cu3O(7-delta) superconductors [DE94-007700] p 3903 N94-32372

FASTENERS

An experimental and analytical investigation of a threaded fastener [VTT-JULK-786] p 3724 N94-31654

Feasibility study of cold expansion processes modelling [DSIS-94-01186] p 3735 N94-31849

FATIGUE (BIOLOGY)

Effects of methamphetamine and fatigue on long- and short-term memory [AD-A276452] p 3799 N94-32187

FATIGUE (MATERIALS)

Fatigue crack propagation and fractography of 3Y-TZP and ZTA [ISBN-0-315-86561-X] p 3736 N94-31912

Effects of frequency and amplitude variations of superimposed minor loading sequences on the corrosion fatigue behavior of aircraft structural aluminum alloys p 3578 N94-31957

The cyclic fatigue behaviour of adhesive joints [AD-A277080] p 3738 N94-32351

Fracture micromechanics of continuous fiber and textile reinforced metal and ceramic matrix composites [AD-A277434] p 3627 N94-33008

FATIGUE LIFE

A laboratory study of multiple site damage in fuselage lap splices [AD-A276151] p 3578 N94-31078

Contribution to the study of multiaxial fatigue under periodic or random stresses [ISAL-92-0004] p 3734 N94-31544

Fatigue behavior of unidirectional pultruded composite materials [ISBN-0-315-86425-7] p 3621 N94-31719

Feasibility study of cold expansion processes modelling [DSIS-94-01186] p 3735 N94-31849

Active control for fin buffet alleviation [AD-A276844] p 3586 N94-32224

Fatigue testing of 2024-T3 material after four cycles of PMB stripping [AD-A276926] p 3644 N94-32237

FATIGUE TESTS

An experimental and analytical investigation of a threaded fastener [VTT-JULK-786] p 3724 N94-31654

Fatigue crack propagation and fractography of 3Y-TZP and ZTA [ISBN-0-315-86561-X] p 3736 N94-31912

Creep-fatigue criteria and inelastic behavior of modified 9Cr-1Mo steel at elevated temperatures [DE94-007915] p 3642 N94-31918

Effects of frequency and amplitude variations of superimposed minor loading sequences on the corrosion fatigue behavior of aircraft structural aluminum alloys p 3578 N94-31957

FAULT DETECTION

Quench detection and instrumentation for the Tokamak Physics Experiment magnets [DE94-006656] p 3888 N94-31667

Model-based reconfiguration: Diagnosis and recovery [NASA-CR-4596] p 3820 N94-32776

Fault detection and isolation for the Bluebird test bed aircraft [AD-A277979] p 3586 N94-33086

Assessing the vulnerability of multi-commodity networks with failing components [AD-A278434] p 3684 N94-33334

FAULT TOLERANCE

Fault coverage measurement for digital microcircuits [AD-A276226] p 3686 N94-31066

Quench detection and instrumentation for the Tokamak Physics Experiment magnets [DE94-006656] p 3888 N94-31667

Using atomic actions in replica groups to simplify the replication implementation [REPT-93-78] p 3813 N94-31695

Parallel and distributed computing combinatorial algorithms [AD-A277333] p 3826 N94-32243

Interpreter composition issues in the formal verification of a processor-memory module [NASA-CR-4594] p 3820 N94-32775

Model-based reconfiguration: Diagnosis and recovery [NASA-CR-4596] p 3820 N94-32776

Fault detection and isolation for the Bluebird test bed aircraft [AD-A277979] p 3586 N94-33086

FAULT TREES

GRAFTED - GRAphical fault tree EDitor: A fault tree description program for target vulnerability/survivability analysis. User manual [AD-A277067] p 3818 N94-32390

FEAR

Stress-induced enhancement of the startle reflex [AD-A278414] p 3802 N94-33327

FEASIBILITY

Feasibility study to evaluate plasma quench process for natural gas conversion applications [DE94-000086] p 3758 N94-31234

FEASIBILITY ANALYSIS

Proof of concept for the rewrite rule machine: Interensemble studies [AD-A276506] p 3809 N94-31263

Economic feasibility analysis of distributed electric power generation based upon the natural gas fired fuel cell [DE94-005795] p 3759 N94-31487

Feasibility study for the recycling of nickel metal hydride electric vehicle batteries [DE94-000268] p 3690 N94-31598

Feasibility in the use of satellite remote sensing data as a fast reaction tool for natural disastar relief p 3748 N94-32526

Removal of CO2 from flue gases by algae [DE94-008039] p 3766 N94-32703

Focused feasibility study final field sampling plan [AD-A277445] p 3769 N94-33105

FEED SYSTEMS

Development of an automated wire delivery system for robotic welding applications [NASA-CR-194216] p 3727 N94-32479

Buffered feedthrough crossbar switch [AD-D016145] p 3697 N94-32967

FEEDBACK

Controls design with crossfeeds for hovering rotorcraft using quantitative feedback theory [NASA-CR-195765] p 3585 N94-31203

A hypertext system that learns from user feedback p 3923 N94-32428

FEEDBACK CONTROL

Control of a flexible space robot tracking a moving target p 3722 N94-31469

Automatic resonator alignment and power stabilization of high power C02 lasers [ISBN-0-315-77217-4] p 3714 N94-31472

Adaptive nonlinear control of spacecraft p 3609 N94-31564

Digital state-feedback H(infinity) control of Pritchard-Salamon systems: A Popov function approach [REPT-93-69] p 3830 N94-31647

Development of a reconfigurable helicopter flight control system [ISBN-0-315-87218-7] p 3585 N94-31837

High-speed path constrained manipulator operation using optimal-feedback combined controller p 3833 N94-31962

A novel potential/viscous flow coupling technique for computing helicopter flow fields [NASA-CR-193272] p 3571 N94-32476

Control strategies for systems with limited actuators [NASA-CR-195307] p 3727 N94-32741

FEEDFORWARD CONTROL

Development of a feedforward controller for a flexible manipulator [ISBN-0-315-86515-6] p 3832 N94-31801

FEEDING (SUPPLYING)

Feed-forward control of gear mesh vibration using piezoelectric actuators [NASA-TM-106366] p 3728 N94-32902

FELDSPARS

In-situ TEM crystallization of anorthite-glass films on (alpha)-Al2O3 [DE94-006317] p 3652 N94-31780

FERMENTATION

Recovery of carboxylic acids at pH greater than pKa [DE94-007030] p 3636 N94-32376

FERMI LIQUIDS

Short coherence length superconductors: Intermediate regime between BCS and bosons [DE94-007694] p 3904 N94-32645

FERMI SURFACES

Fermi surface instability at 0.4 K in a heavy-fermion YbBiPt: SDW? [DE94-006224] p 3899 N94-31916

FERMIONS

The 4f heavy fermion photoelectron spectra do not exhibit the Kondo scale [DE94-006252] p 3898 N94-31631

Fermi surface instability at 0.4 K in a heavy-fermion YbBiPt: SDW? [DE94-006224] p 3899 N94-31916

Investigation of superconductivity and magnetism in d and f-electron materials [DE94-008535] p 3907 N94-32933

FERRIC IONS

The importance of environmental conditions in reflectance spectroscopy of laboratory analogs for Mars surface materials p 3944 N94-33195

FERROELECTRICITY

Emission from ferroelectric cathodes [DE94-006732] p 3863 N94-31270

Electrooptic crystal growth and properties [AD-A276023] p 3896 N94-31439

Thin-film decoupling capacitors for multi-chip modules [DE94-007743] p 3695 N94-32650

Energetics, bonding mechanism, and electronic structure of ceramic/ceramic and metal/ceramic interfaces
[DE94-008551] p 3659 N94-32656
The ferroelectric behavior of odd-numbered nylons
[AD-A278126] p 3663 N94-33058
Electric field-induced changes in odd-numbered nylons
[AD-A278003] p 3664 N94-33138

FERTILIZERS
Monitoring fertilizer application by imaging spectrometry (Somerset Levels test site) p 3745 N94-31863

FIBER COMPOSITES
Performance of selected polymeric materials on LDEF p 3593 N94-31023
On the mechanics of stress analysis of fiber-reinforced composites p 3619 N94-31481
On the constitutive response of transversely loaded fiber composites with compliant interphases p 3619 N94-31555
Ultrasonic tomography in fiber-reinforced composite materials p 3620 N94-31565
Powder metallurgical processing of fibre reinforced aluminium composites
[PB94-148285] p 3620 N94-31686
Optimization of the forming parameters of PEEK/carbon fiber composite
[ISBN-0-315-86410-9] p 3620 N94-31716
Fracture mechanics and micromechanisms in fiber-reinforced composites p 3622 N94-31986
Sodium sulfate corrosion of silicon carbide fiber-reinforced lithium aluminosilicate glass-ceramic matrix composites
[AD-A277224] p 3623 N94-32023
Finite element analysis of damage in fibrous composites using a micromechanical model
[AD-A277226] p 3623 N94-32024
Mechanics of the single fiber pullout problem with several interface conditions p 3623 N94-32078
Pressureless sintering of ceramic composites
[AD-A277274] p 3657 N94-32404
Effects of interphases on the mechanical, thermal and hygromechanical response of fiber-reinforced composites p 3624 N94-32496
The effect of ductile phase (Nb) reinforcement morphology on the mechanical behavior of an intermetallic matrix (MoSi2) p 3615 N94-32500
Improved oxidation resistance of 3-D carbon/carbon composites
[AD-A277349] p 3625 N94-32624
METCAN demonstration manual, version 1.0
[NASA-TM-105607] p 3626 N94-32858
Analysis of new composite architectures
[NASA-CR-195303] p 3626 N94-32904
Fracture micromechanics of continuous fiber and textile reinforced metal and ceramic matrix composites
[AD-A277434] p 3627 N94-33008
Surface conforming flexible eddy current probe for scanning varying surface contours
[AD-D016173] p 3627 N94-33018
Nonlocal theory for fracturing of quasibrittle materials
[AD-A278283] p 3740 N94-33143
Novel precursor approached for CMC derived by polymer pyrolysis
[AD-A278383] p 3665 N94-33352

FIBER OPTICS
Fiber optic chemical sensors on Mars
[DE94-005251] p 3941 N94-31145
Advanced optical fiber communication systems
[AD-A276416] p 3878 N94-31330
Fiberoptisk magnetfaltsensor (fiber optic magnetometer)
[PB94-148061] p 3878 N94-31584
Nd-YAG laser welding of the fiber optic connector to the header shell on the 2SL actuator
[DE94-006104] p 3723 N94-31621
Fiber optic sensors for the detection of surface acoustic waves on metals
[ISBN-0-315-87055-9] p 3878 N94-31736
The vision machines
[NASA-TM-109757] p 3606 N94-31816
A technique for multiplexing 3x3-coupler terminated interferometric fiber-optic sensors
[AD-A276739] p 3880 N94-32180
Fiber optic chemical sensors
[AD-A277128] p 3881 N94-32380
Studies of an optical multi-processor interconnect
[AD-A277093] p 3681 N94-32392
Mathematical nonlinear optics
[AD-A277320] p 3882 N94-32510
Passive, multi-channel fiber optic rotary joint assembly
[AD-D016116] p 3882 N94-32626
Gigabits to the Desktop: Installing tomorrow's networks today
[DE94-007701] p 3827 N94-32646
Automated fiber pigtailing technology
[DE94-007072] p 3695 N94-32688
Torque-balanced extendable fiber optic cable
[AD-D016097] p 3882 N94-32719
Fiber optic continuous true time-delay modulator
[AD-D016098] p 3883 N94-32720
Multi-line passive fiber optic slipring
[AD-D016092] p 3883 N94-32738
Long distance transmission of 15 Gb/s digital using subcarrier multiplexing and external modulation
[DE94-008298] p 3682 N94-32756
Strain sensing using optical fibers
[NASA-CR-195807] p 3740 N94-32940

FIBER ORIENTATION
Comparison of the compressive strengths for stitched and toughened composite systems
[NASA-TM-109108] p 3627 N94-32939

FIELD ALIGNED CURRENTS
Convection and electrodynamic signatures in the vicinity of a Sun-aligned arc: Results from the Polar Acceleration Regions and Convection Study (Polar ARCS) p 3954 N94-31102

FIELD COILS
Structural design of the superconducting Poloidal Field coils for the Tokamak Physics Experiment
[DE94-007078] p 3887 N94-31406

FIELD EFFECT TRANSISTORS
A silicon condenser microphone: Modelling and electronic circuitry
[ISBN-9-09-005279-8] p 3688 N94-31517
Employment of a porous gold actuator in ISFET-based coulometric sensor-actuator systems with application to protein characterization
[ISBN-9-09-005887-7] p 3689 N94-31536
Perspectives of glucose sensing based on a charge-modulating competition reaction
[ISBN-9-09-005754-4] p 3795 N94-31652
Radiation tolerant, high speed, low power, gallium arsenide logic
[AD-A277293] p 3694 N94-32509
Research on high reliability refractory ohmic contacts for GaAs FETs and MODFETs
[AD-A276848] p 3697 N94-33034
Characteristics of III-V semiconductor devices at high temperature
[NASA-TM-106574] p 3697 N94-33052
Advanced silicon technology for microwave circuits
[AD-A278039] p 3698 N94-33091
Temperature dependence of single-event burnout in n-channel power MOSFET's
[AD-A277921] p 3698 N94-33177
Electrical characteristics of GaAs MESFET fabrication by ion implantation of Si or Se
[AD-A278416] p 3909 N94-33328

FIELD THEORY (ALGEBRA)
Topological conformal algebra in 2D gravity coupled to minimal matter
[DE94-008122] p 3910 N94-31052
N(exp n(n-1)/2)-state R-matrix related with U(sub q)(si(n)) algebra at q(exp 2N) = 1
[DE94-008140] p 3902 N94-32247

FIELD THEORY (PHYSICS)
Experimental investigation of phonon eigenvectors using x ray interference fields
[ETN-94-95751] p 3865 N94-31511
Conformal field theory and geometry of strings
[PB94-148442] p 3857 N94-31770
New QCD results from string theory
[DE94-005226] p 3911 N94-31823
Wavevector-frequency analysis with applications to acoustics
[AD-A276618] p 3861 N94-32125
The future of high-energy physics in the US: Statement for the 1994 HEPAP Subpanel
[DE94-008994] p 3876 N94-32588

FIGHTER AIRCRAFT
Aircraft simulation and pilot proficiency: From surrogate flying towards effective training
[AD-B179300] p 3587 N94-31179
Prospects for the French fighter industry in a post-cold war environment: is the future more than a mirage? p 3565 N94-31959
Active control for fin buffet alleviation
[AD-A276844] p 3586 N94-32224

FINANCIAL MANAGEMENT
Managing performance of DB2 Ad Hoc Reports
[DE94-006669] p 3920 N94-32635

FINE STRUCTURE
Instrumentation for EXELFS measurements using convergent beam diffraction coupling to the electron energy loss spectrometer
[USIP-93-07] p 3858 N94-31084
The double probe electric field experiment on Freja: Description and first results
[TRITA-ALP-1993-02] p 3885 N94-31089
Near edge x ray spectroscopy theory
[DE94-008179] p 3905 N94-32799
Fine and microstructure observations at Fieberlin g Guyot R/V new horizon cruise report
[AD-A277917] p 3791 N94-33109
Cruise report: Oceanus 250 leg 4 high resolution profiler survey for the North Atlantic Tracer Release Experiment, 25 March - 24 April, 1992
[AD-A277935] p 3791 N94-33245

FINGERS
Numerical model of the thermal behavior of an extremity in a cold environment including counter-current heat exchange between the blood vessels
[AD-A276099] p 3798 N94-33040

FINITE DIFFERENCE THEORY
An efficient three-dimensional Poisson solver for SIMD high-performance-computing architectures p 3823 N94-31120
Nonlinear calculations of the time evolution of black hole accretion disks p 3929 N94-31127
Gas dynamics for accretion disk simulations p 3932 N94-31144
Numerical analysis of single-vortex/free-surface interaction
[AD-A276462] p 3701 N94-31241
A simplified Von Neumann method for linear stability analysis
[CRANFIELD-AERO-9310] p 3843 N94-31540
Applied Computational Electromagnetics Society Journal, volume 9, number 1, March 1994
[AD-A276753] p 3679 N94-32183
COVICS: A covert video communications system
[DE94-007568] p 3682 N94-32745
Preconditioned time-difference methods for advection-diffusion-reaction equations
[DE94-006472] p 3638 N94-32840
A finite-difference approximate-factorization algorithm for solution of the unsteady transonic small-disturbance equation
[NASA-TP-3129] p 3572 N94-32865
Theoretical and experimental study of microstrip-to-slot line uniplanar transition
[NASA-TM-106566] p 3696 N94-32905
Parallel supercomputing: Advanced methods, algorithms, and software for large-scale linear and nonlinear problems
[DE94-008446] p 3836 N94-32992
Analysis of a slot coupled coplanar waveguide fed patch antenna
[NASA-TM-106567] p 3698 N94-33116
Computational methods in continuum mechanics
[AD-A278144] p 3859 N94-33161

FINITE ELEMENT METHOD
Patterns of deformation and volcanic flows associated with lithospheric loading by large volcanoes on Venus p 3776 N94-31106
State of stress, faulting, and eruption characteristics of large volcanoes on Mars p 3940 N94-31108
An adaptive finite element method for unsteady compressible rotor airfoil aerodynamics p 3567 N94-31204
An efficient higher order theory for laminated composite plates and a finite element implementation p 3617 N94-31215
Design and analysis of scalable parallel algorithms
[AD-A276255] p 3809 N94-31251
Tearing resistance of a thin shell against projectile penetration: Material property effects
[DE94-007466] p 3733 N94-31316
Contributions to the validation of the CJS model for granular materials
[ECL-92-56] p 3733 N94-31376
Development and application of a multimesh auto-adaptive finite element method for the calculation of an electric arc plasma
[ECL-89-03] p 3886 N94-31378
Finite element numerical simulation of turbulent flows
[ISBN-0-315-86418-8] p 3703 N94-31717
Finite element vorticity-based methods for the solution of the incompressible and compressible Navier-Stokes equations
[ISBN-0-315-87265-9] p 3703 N94-31730
The finite element method with asymptotic self-similar solutions p 3736 N94-31904
Finite element analysis of time-independent superconductivity p 3691 N94-31905
Nonlinear analysis of springs using helical finite elements p 3859 N94-31906
Finite element analysis of damage in fibrous composites using a micromechanical model
[AD-A277226] p 3623 N94-32024
Minimization of computational requirements in the hybrid stress finite element method
[AD-A277120] p 3846 N94-32048
Finite element analysis of MB326H Macchi wing lower spar cap fatigue cracks
[AD-A277062] p 3580 N94-32264

Control and stabilization of distributed parameter systems; theoretical and computational aspects
[AD-A277239] p 3738 N94-32275
QUAD4 seminar
[AD-A277366] p 3818 N94-32330
Eta percent-superconvergence in the interior of locally refined meshes of quadrilaterals: Superconvergence of the gradient in finite element solutions of Laplace's and Poisson's equations
[AD-A277242] p 3848 N94-32331
Finite element solution to the Helmholtz equation with high wave number. Part 1: The h-version of the FEM
[AD-A277396] p 3848 N94-32341
Development of an advanced continuum theory for composite laminates, volume 2
[AD-A277276] p 3625 N94-32592
Automatic contact in DYNA3D for vehicle crashworthiness
[DE94-007143] p 3738 N94-32637
The 2D deterministic radiation transport with the discontinuous finite element method
[DE94-004687] p 3849 N94-32670
BUCKY instruction manual, version 3.3
[NASA-TM-104793] p 3820 N94-32899
Manual for automatic generation of finite element models of spiral bevel gears in mesh
[NASA-CR-191009] p 3728 N94-32900
A case study of analysis methods for large deflections of a cantilever beam
[NASA-TM-108454] p 3739 N94-32903
Analysis of new composite architectures
[NASA-CR-195303] p 3626 N94-32904
Theoretical and experimental study of microstrip-to-slot line uniplanar transition
[NASA-TM-106566] p 3696 N94-32905
A procedure for 3-D contact stress analysis of spiral bevel gears
[NASA-CR-194472] p 3728 N94-32929
Parallel supercomputing: Advanced methods, algorithms, and software for large-scale linear and nonlinear problems
[DE94-008446] p 3836 N94-32992
Finite-element modeling of the blockage and scattering of LG propagation
[AD-A277430] p 3775 N94-33006
On the mechanics of microballoon-reinforced metal matrix composites
[AD-A277928] p 3830 N94-33178

FINITE VOLUME METHOD
Multidimensional WAF-type schemes for model conservation laws
[CRANFIELD-AERO-9312] p 3843 N94-31541
Finite volume discretization of the k-epsilon turbulence model in general coordinates
[REPT-93-90] p 3703 N94-31703

FINS
Heat transfer studies on a rectangular channel with offset plate fins
[AD-A277300] p 3912 N94-32043
Active control for fin buffet alleviation
[AD-A276844] p 3586 N94-32224

FIR FILTERS
VLSI for high-speed digital signal processing
[AD-A277617] p 3697 N94-32957

FIRE EXTINGUISHERS
Influence of carbon dioxide on electronic equipment: Fire extinguishing with low concentration
[PB94-148749] p 3691 N94-31848

FIRE FIGHTING
Influence of carbon dioxide on electronic equipment: Fire extinguishing with low concentration
[PB94-148749] p 3691 N94-31848
Description of DCS (Data Converting System) and CT (Cone Tool). A reprint of a note published in Fire and Materials titled Fire Test Data Available for Your Purpose
[PB94-138559] p 3918 N94-32293
Glutinous water: Protecting vertical and overhead surfaces from fire spread
[AD-A277280] p 3575 N94-32405

FIRES
Solid surface
[NASA-TM-109746] p 3634 N94-31883
Description of DCS (Data Converting System) and CT (Cone Tool). A reprint of a note published in Fire and Materials titled Fire Test Data Available for Your Purpose
[PB94-138559] p 3918 N94-32293
Glutinous water: Protecting vertical and overhead surfaces from fire spread
[AD-A277280] p 3575 N94-32405

FISCHER-TROPSCH PROCESS
The development of precipitated iron catalysts with improved stability
[DE94-008711] p 3638 N94-32886
Technology development for iron Fischer-Tropsch catalysts
[DE94-008723] p 3638 N94-32889

FLAME PROPAGATION
Reactive flows in compact objects
p 3934 N94-31567
A model of concurrent flow flame spread over a thin solid fuel p 3634 N94-31795
A numerical method for mixing/chemically reacting compressible flow with finite rate chemistry
p 3634 N94-31824
Solid surface
[NASA-TM-109746] p 3634 N94-31883

FLAME RETARDANTS
Glutinous water: Protecting vertical and overhead surfaces from fire spread
[AD-A277280] p 3575 N94-32405

FLAME STABILITY
A model of concurrent flow flame spread over a thin solid fuel p 3634 N94-31795

FLAMES
A model of concurrent flow flame spread over a thin solid fuel p 3634 N94-31795

FLAMMABILITY
Glutinous water: Protecting vertical and overhead surfaces from fire spread
[AD-A277280] p 3575 N94-32405

FLASH LAMPS
A reliable low-maintenance flashlamp-pumped Ti:sapphire laser operating at 120 PPS
[DE94-009030] p 3721 N94-32848

FLASHOVER
Studies of the plasma triggering mechanism of inverse pinch switch
[AD-A276117] p 3887 N94-31530

FLATNESS
Space Station Freedom Solar Array tension mechanism development p 3604 N94-33300

FLAVOR (PARTICLE PHYSICS)
Proceedings of the Workshop on B Physics at Hadron Accelerators
[DE94-007961] p 3877 N94-32748

FLEXIBILITY
Adaptive operating systems concepts
[ETN-94-95754] p 3830 N94-31514
Flexible drive shaft coupling
[AD-D016096] p 3727 N94-32718

FLEXIBLE BODIES
Point-contact and point-impact dynamics for multibody chains
[ISBN-0-315-87056-7] p 3734 N94-31737
Control and stabilization of distributed parameter systems; theoretical and computational aspects
[AD-A277239] p 3738 N94-32275
Identification and control of structures in space
[NASA-CR-195910] p 3612 N94-33115
Space Station Freedom Solar Array tension mechanism development p 3604 N94-33300

FLEXIBLE SPACECRAFT
A study of the Space Station Freedom response to the disturbance environment p 3600 N94-31434
Dynamics and control of orbiting flexible systems: A formulation with applications
[ISBN-0-315-75390-0] p 3611 N94-32502

FLEXING
Reliability analysis of structural ceramics subjected to biaxial flexure p 3650 N94-31454

FLIGHT ALTITUDE
Neutron measurements at the commercial aircraft altitudes
[ISBN-0-315-86201-7] p 3955 N94-31709

FLIGHT CHARACTERISTICS
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-flight dynamics module, volume 4
[AD-A276971] p 3590 N94-32396

FLIGHT CLOTHING
Aircrew Eye/Respiratory Protection (AERP): 16-hour extended wear evaluation of chemical protective equipment
[AD-A277288] p 3804 N94-32609

FLIGHT CONTROL
Controls design with crossfeeds for hovering rotorcraft using quantitative feedback theory
[NASA-CR-195765] p 3585 N94-31203
Development of a reconfigurable helicopter flight control system
[ISBN-0-315-87218-7] p 3585 N94-31837
Antiwindup analysis and design approaches for MIMO systems
[NASA-CR-195304] p 3584 N94-32075
Active control for fin buffet alleviation
[AD-A276844] p 3586 N94-32224
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-flight controls module, volume 3
[AD-A276970] p 3590 N94-32395
Aircraft incident report: In-flight turbulence encounter and loss of portions of the elevators, China Airlines Flight CI-012, McDonnell Douglas MD-11-P, Taiwan Registration B-150 about 20 miles east of Japan, 7 December 1992
[PB94-910403] p 3576 N94-32938
Investigation of drive-reinforcement learning and application of learning to flight control
[AD-A277442] p 3801 N94-33053
Fault detection and isolation for the Bluebird test bed aircraft
[AD-A277979] p 3586 N94-33086
The analysis of wake-induced unsteady aerodynamics related to higher harmonic control
[AD-A277914] p 3573 N94-33108

FLIGHT CREWS
Situational awareness: A feasibility investigation of near-threshold skills development
[AD-A276467] p 3798 N94-31243
Neutron measurements at the commercial aircraft altitudes
[ISBN-0-315-86201-7] p 3955 N94-31709
Planning of air crew schedules
[ISBN-0-315-86506-7] p 3914 N94-32074
Assessment of interior modifications in C-130 and C-141 aircraft for night vision goggle operations
[AD-A276843] p 3582 N94-32223
Unit specific crew rest strategies: Phase 1 evaluation of the 1/212th Aviation Battalion during shiftwork transitions
[AD-A277122] p 3804 N94-32379
Cockpit Electronic Display Workshop: A synopsis
[AD-A277728] p 3583 N94-33280

FLIGHT HAZARDS
Rotorcraft ditchings and water-related impacts that occurred from 1982 - 1989, phase 2
[AD-A276473] p 3574 N94-31246

FLIGHT MECHANICS
Modeling of aircraft unsteady aerodynamic characteristics. Part 1: Postulated models
[NASA-TM-109120] p 3586 N94-32951

FLIGHT OPERATIONS
Common property resources and low-level flying in Labrador: Flight, fight or fancy?
[ISBN-0-315-87318-3] p 3924 N94-31732
Operations summary for the convection and moisture experiment (CAMEX)
[NASA-TM-108445] p 3786 N94-33004

FLIGHT PATHS
Flight technical error for category B non-precision approaches and missed approaches using non-differential GPS for course guidance
[PB94-142734] p 3576 N94-31680

FLIGHT PLANS
Plan recognition for an air traffic control simulation
[DSIS-94-01221] p 3577 N94-32505

FLIGHT SAFETY
Evaluation for the development of taxiway lighting intensity standards
[AD-A276706] p 3588 N94-32120
Aircraft incident report: In-flight turbulence encounter and loss of portions of the elevators, China Airlines Flight CI-012, McDonnell Douglas MD-11-P, Taiwan Registration B-150 about 20 miles east of Japan, 7 December 1992
[PB94-910403] p 3576 N94-32938
Three dimensional audio versus head down TCAS displays
[NASA-CR-177636] p 3576 N94-33063

FLIGHT SIMULATION
Variable-resolution imagery for flight simulation
[AD-A276199] p 3586 N94-31058
Controls design with crossfeeds for hovering rotorcraft using quantitative feedback theory
[NASA-CR-195765] p 3585 N94-31203
High performance real-time flight simulation at NASA Langley p 3591 N94-32473

FLIGHT SIMULATORS
Aircraft simulation and pilot proficiency: From surrogate flying towards effective training
[AD-B179300] p 3587 N94-31179
Modular Simulator System (MSS) management guide
[AD-A277098] p 3588 N94-32014
Visual evaluation of computer-generated textures
[AD-A277201] p 3816 N94-32093
Modular Simulator System (MSS). Executive report
[AD-A276966] p 3588 N94-32241
Modular Simulator System (MSS). Interface requirements specification for the generic MSS
[AD-A276965] p 3588 N94-32311
Modular Simulator System (MSS). System/segment specification for the generic MSS-system integration, volume 1
[AD-A276968] p 3588 N94-32312

Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-flight station module, volume 2
[AD-A276969] p 3588 N94-32313
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-radar module, volume 8
[AD-A276975] p 3589 N94-32314
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-electronic warfare module, volume 9
[AD-A276976] p 3589 N94-32315
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-physical cues module, volume 10
[AD-A276977] p 3589 N94-32316
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-visual module, volume 11
[AD-A276978] p 3589 N94-32317
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-instructor/operator station module, volume 12
[AD-A276979] p 3589 N94-32318
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-environment module, volume 13
[AD-A276980] p 3589 N94-32319
Modular Simulator System (MSS). Engineering design guide
[AD-A276967] p 3589 N94-32394
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-flight controls module, volume 3
[AD-A276970] p 3590 N94-32395
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-flight dynamics module, volume 4
[AD-A276971] p 3590 N94-32396
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-propulsion module propulsion module, volume 5
[AD-A276972] p 3590 N94-32397
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-navigation/communication module, volume 6
[AD-A276973] p 3590 N94-32398
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-weapons module, volume 7
[AD-A276974] p 3590 N94-32399
Modular Simulator System (MSS): Interface design document for the generic MSS
[AD-A277270] p 3590 N94-32403
High performance real-time flight simulation at NASA Langley p 3591 N94-32473
An evaluation framework for designing a night vision, computer-based trainer
[AD-A278005] p 3590 N94-33139

FLIGHT TESTS

Utilizing a Russian space nuclear reactor for a United States space mission: Flight qualification issues
[DE94-004674] p 3613 N94-31265
Flight technical error for category B non-precision approaches and missed approaches using non-differential GPS for course guidance
[PB94-142734] p 3576 N94-31680
In flight measurement of steady and unsteady blade surface pressure of a single rotation large scale advanced prop-fan installed on the PTA aircraft
[NASA-CR-187096] p 3584 N94-32859
Flight test results of riblets at supersonic speeds
[NASA-TM-4387] p 3572 N94-32880
Synthetic vision technology demonstration. Volume 1: Executive summary
[DOT/FAA/RD-93/40-VOL-1] p 3582 N94-33076
Synthetic vision technology demonstration. Volume 2: Sensor tower testing
[DOT/FAA/RD-93/40-VOL-2] p 3582 N94-33077
Synthetic vision technology demonstration. Volume 3: Flight tests
[DOT/FAA/RD-93/40-VOL-3] p 3582 N94-33078
Synthetic vision technology demonstration. Volume 4: Appendices
[DOT/FAA/RD-93/40-VOL-4] p 3583 N94-33079
The analysis of wake-induced unsteady aerodynamics related to higher harmonic control
[AD-A277914] p 3573 N94-33108
Advanced release technologies program p 3607 N94-33322

FLIGHT TRAINING

Aircraft simulation and pilot proficiency: From surrogate flying towards effective training
[AD-B179300] p 3587 N94-31179
Modular Simulator System (MSS) management guide
[AD-A277098] p 3588 N94-32014
Modular Simulator System (MSS). Executive report
[AD-A276966] p 3588 N94-32241
Modular Simulator System (MSS). Interface requirements specification for the generic MSS
[AD-A276965] p 3588 N94-32311
Modular Simulator System (MSS). System/segment specification for the generic MSS-system integration, volume 1
[AD-A276968] p 3588 N94-32312
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-flight station module, volume 2
[AD-A276969] p 3588 N94-32313
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-radar module, volume 8
[AD-A276975] p 3589 N94-32314
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-electronic warfare module, volume 9
[AD-A276976] p 3589 N94-32315
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-physical cues module, volume 10
[AD-A276977] p 3589 N94-32316
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-visual module, volume 11
[AD-A276978] p 3589 N94-32317
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-instructor/operator station module, volume 12
[AD-A276979] p 3589 N94-32318
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-environment module, volume 13
[AD-A276980] p 3589 N94-32319
The effects of Above Real-Time Training (ARTT) in an F-16 simulator p 3591 N94-32474

FLOATING

VLSI implementation of stray insensitive switched capacitor composite operational amplifiers
[AD-A276461] p 3687 N94-31240

FLOATS

Profiling ALACE instruments
[AD-A277246] p 3789 N94-32321

FLOODS

Feasibility in the use of satellite remote sensing data as a fast reaction tool for natural disaster relief p 3748 N94-32526
Simulation of a precipitation event in the western United States
[DE94-004835] p 3786 N94-32791

FLOW CHARACTERISTICS

Oscillating-flow loss test results in rectangular heat exchanger passages
[NASA-CR-185297] p 3615 N94-32792
Control of low-speed turbulent separated flow over a backward-facing ramp
[NASA-TM-109740] p 3573 N94-33071

FLOW DISTORTION

Inlet distortion in engines on VSTOL aircraft
[NASA-CR-195841] p 3584 N94-33035

FLOW DISTRIBUTION

Computational study of single-expansion-ramp nozzles with external burning
[NASA-TM-106550] p 3700 N94-31229
Hypervelocity Tunnel 9 Mach 10/14 Calibration
[AD-A275960] p 3587 N94-31318
A novel CFD/structural analysis of a cross parachute
[DE94-005271] p 3568 N94-31578
On an adaptation method for dense, 2D, C-type grids
[W-9321] p 3706 N94-32045
Optical flow from 1D correlation: Application to a simple time-to-crash detector
[AD-A276777] p 3880 N94-32186
Design of a two dimensional planer pressurized air labyrinth seal test rig
[AD-A277232] p 3726 N94-32370
An experimental study of the flowfield on a semispan rectangular wing with a simulated glaze ice accretion
[NASA-CR-195301] p 3571 N94-32475
A novel potential/viscous flow coupling technique for computing helicopter flow fields
[NASA-CR-193272] p 3571 N94-32476
Results for the hybrid laminar flow control experiment conducted in the NASA Langley 8-foot transonic pressure tunnel on a 7-foot chord model
[NASA-TM-107582] p 3601 N94-32870
Computation of three-dimensional compressible boundary layers to fourth-order accuracy on wings and fuselages
[NASA-CR-4269] p 3709 N94-32871
Use of Navier-Stokes methods for the calculation of high-speed nozzle flow fields
[NASA-TM-106551] p 3573 N94-32984
Characteristics of ion flow in the quiet state of the inner plasma sheet
[AD-A277451] p 3894 N94-33106
Direct replacement of arbitrary grid-overlapping by non-structured grid
[NASA-TM-106601] p 3850 N94-33120

FLOW EQUATIONS

Prediction of transonic potential flow with slipstreams around configurations
[FFA-TN-1992-15] p 3568 N94-31220
Surface boundary conditions and related technical issues concerning Burnett equations for 2-D hypersonic flow
[AD-A277322] p 3706 N94-32256

FLOW MEASUREMENT

Hotwire measurements of the turbulent flow into a cascade of controlled-diffusion compressor blades
[AD-A277297] p 3706 N94-32042
Electromagnetic probe technique for fluid flow measurements p 3711 N94-32455
Shear flow control of cold and heated rectangular jets by mechanical tabs. Volume 1: Results and discussion
[NASA-CR-182296-VOL-1] p 3708 N94-32867
Shear flow control of cold and heated rectangular jets by mechanical tabs. Volume 2: Tabulated data
[NASA-CR-182296-VOL-2] p 3709 N94-32869
Scalar imaging velocimetry studies of turbulent flow structure and dynamics
[AD-A278395] p 3710 N94-33164
Calibration and validation studies in the LENS facility
[AD-A278403] p 3591 N94-33167
Backward-facing step measurements at low Reynolds number, Re(sub h)=5000
[NASA-TM-108807] p 3711 N94-33290

FLOW RESISTANCE

Effects of combined breathing impediments on diver's respiratory performance
[AD-A277437] p 3805 N94-33084

FLOW STABILITY

On the structure and stability of slender viscous vortices p 3700 N94-31218
Workshop on advances in smooth particle hydrodynamics
[DE94-006221] p 3956 N94-31308
Structure and stability of spherical accretion flows onto compact objects p 3935 N94-31946

FLOW VELOCITY

Oscillations in piston-driven shear flow of a non-Newtonian fluid
[AD-A276472] p 3701 N94-31245
Backward-facing step measurements at low Reynolds number, Re(sub h)=5000
[NASA-TM-108807] p 3711 N94-33290

FLOW VISUALIZATION

Parallel particle simulations of low-density fluid flows
[DE94-007858] p 3707 N94-32373

FLUE GASES

Removal of CO2 from flue gases by algae
[DE94-008039] p 3766 N94-32703

FLUENCE

Defect cascades produced by neutron irradiation in YBa2Cu3O(7-delta) superconductors
[DE94-007700] p 3903 N94-32372
Vulnerability assessment of a space based weapon platform electronic system exposed to a thermonuclear weapon detonation
[DE94-007229] p 3611 N94-32667
Resistivity measurements on the neutron irradiated detector grade silicon materials
[DE94-009083] p 3906 N94-32822

FLUID BOUNDARIES

Laser-induced fluorescence/particle tracking system for stratified flow research
[AD-A275917] p 3701 N94-31341
Sound scattering by cylinders of noncircular cross section
[AD-A276663] p 3861 N94-32089

FLUID DYNAMICS

A cross-disciplinary report on the mathematical sciences applied to materials science, part 1
[AD-A276116] p 3843 N94-31529
Steady thermal convection in multiple liquid layers p 3705 N94-31844
Effects of buoyancy on fluid flows and turbulence
[AD-A276586] p 3706 N94-32123
Chemical vapor deposition fluid flow simulation modelling tool
[NASA-CR-189648] p 3707 N94-32480
Fluid Dynamics Lagranglan Simulation Model
[AD-A277438] p 3710 N94-33009
Renormalization group theory of Bolgiano scaling in Boussinesq turbulence
[NASA-TM-106602] p 3710 N94-33070
The structure of high Reynolds number turbulent boundary layers, part A
[AD-A278392] p 3710 N94-33162

Scalar imaging velocimetry studies of turbulent flow structure and dynamics
[AD-A278395] p 3710 N94-33164

FLUID FILMS
Simultaneous pressure measurement and high-speed photography study of cavitation in a dynamically loaded journal bearing
[NASA-TM-106456] p 3728 N94-32893

FLUID FLOW
A heterogeneous computing environment for simulating astrophysical fluid flows p 3928 N94-31119
Reactive flows in compact objects p 3934 N94-31567
Parallel particle simulations of low-density fluid flows
[DE94-007858] p 3707 N94-32373
Electromagnetic probe technique for fluid flow measurements p 3711 N94-32455
Computational modeling of convective heat transfer to liquid hydrogen coolant p 3707 N94-32485

FLUID JETS
Analysis of strong acoustic excitation on the breakup and dispersion of a liquid jet
[ONERA-NT-1993-9] p 3701 N94-31422
Enhancement of mixing in a rectangular jet by mechanical tabs
[NASA-CR-185207] p 3709 N94-32872

FLUID MECHANICS
Mathematical research in materials science opportunities and perspectives, part 2
[AD-A276298] p 3852 N94-31296
Chemical vapor deposition fluid flow simulation modelling tool
[NASA-CR-189648] p 3707 N94-32480
On the use of computers for teaching fluid mechanics
[NASA-TM-106587] p 3820 N94-32773
Fluid mechanical measurements within the bottom boundary layer over the Northern California continental shelf during stress
[AD-A277916] p 3791 N94-33243

FLUID-SOLID INTERACTIONS
Doubly asymptotic approximations: Theoretical and numerical analyses
[ONERA-NT-1993-7] p 3840 N94-31231
Fluid-structure interaction in case of water hammer with cavitation
[PB94-148277] p 3702 N94-31588

FLUORESCENCE
Fluorescence observations of LDEF exposed materials as an indicator of induced material reactions p 3593 N94-31025
An axial approach to detection in capillary electrophoresis
[DE94-005556] p 3631 N94-31154
Final results from the SDC dopant search for new green wavelength shifting (WLS) fibers, volume 1
[DE94-006744] p 3878 N94-31271
Evaluation of Fluorescence Line Imager (FLI) airborne imaging spectrometer data for roadside tree damage assessment p 3745 N94-31866
Evaluation of GER- and FLI-data with reference to forest p 3746 N94-31868
Temperature dependence of the exciton-exciton annihilation rate constant in poly(di-n-hexylsilane)
[DE94-005584] p 3655 N94-32102
Design and characterization of a pulsed x ray source for fluorescent lifetime measurements
[DE94-007495] p 3880 N94-32138
Intramolecular charge transfer complexes as fluorescence probes for UV and visible light induced acrylate polymerization
[AD-A277129] p 3657 N94-32381
Conjugated polymer fluorescence: Interplay of correlations and alternation
[DE94-005587] p 3660 N94-32729
Noninvasive spectroscopic diagnosis of superficial ocular lesions and corneal infections
[DE94-006231] p 3797 N94-32732
Development of a video fluorescence system for assessing burn depth
[AD-A278127] p 3798 N94-33092

FLUORIDES
PVDF pressure transducers for shock wave and explosives research
[AD-A277319] p 3712 N94-32051

FLUTTER
Aeroelastic vibrations of lifting surfaces
[ECL-91-01] p 3585 N94-31677
Flutter analysis of a supersonic cascade in time domain using an ADI Euler solver
[NASA-TM-105625] p 3739 N94-32883

FLUTTER ANALYSIS
Computational prediction of stall flutter in spanwise-finite blade cascades p 3584 N94-31967
Flutter analysis of a supersonic cascade in time domain using an ADI Euler solver
[NASA-TM-105625] p 3739 N94-32883

FLUX DENSITY
Transport phenomena in the Earth's plasma sheet p 3772 N94-31970
Development of silver-zinc cells of improved cycle life and energy density
[AD-A277311] p 3693 N94-32329
Transverse energy production with Si and Au beams at AGS energy: Towards hot and dense hadronic matter
[DE94-007178] p 3938 N94-32638

FLUXES
Correlation of flux composition and inclusion characteristics with submerged arc weld metal properties in HY-100 steel
[AD-A277040] p 3726 N94-32261

FLYWHEELS
Flywheel Energy Storage Technology Workshop
[DE94-008064] p 3761 N94-32705

FOAMS
An investigation of the spin-coating process and a model for three-dimensional regular foams p 3649 N94-31206
Glutinous water: Protecting vertical and overhead surfaces from fire spread
[AD-A277280] p 3575 N94-32405

FOCAL PLANE DEVICES
Wavelet transform of fixed pattern noise in focal plane arrays
[AD-A276963] p 3712 N94-32393
A new high-speed IR camera system p 3713 N94-32459
Quantum well infrared photodetector FPA
[AD-A278010] p 3908 N94-33248

FOCUSING
Multi-line passive fiber optic slipring
[AD-D016092] p 3883 N94-32738

FOG
Drop size distributions and related properties of fog for five locations measured from aircraft
[NASA-CR-4585] p 3787 N94-33065

FOLDING STRUCTURES
MSAT boom joint testing and load absorber design p 3606 N94-33315
Deployable and retractable telescoping tubular structure development p 3607 N94-33317

FOOD PROCESSING
Novel ultrasonic method for food hydration
[AD-A277411] p 3804 N94-32580

FOOTPRINTS
The influence of the deorbit-burn manoeuvre on the footprint of a re-entry capsule
[LR-727] p 3609 N94-31705

FORCE DISTRIBUTION
Automatic analysis of force distribution in multi-fingered articulated hands
[ISBN-0-315-87205-5] p 3725 N94-31878

FORCED VIBRATION
Random vibrations of composite beams and plates p 3735 N94-31777

FORECASTING
Exploring phase space concepts in the forecasting of time series with artificial neural networks
[DE94-005810] p 3834 N94-32127
Simulation of a precipitation event in the western United States
[DE94-004835] p 3786 N94-32791
FAA aviation forecasts, fiscal years 1994-2005
[AD-A277808] p 3566 N94-33016
Snowmelt forecasting. Further cold regions development of operational hydrological forecasting, volume 2
[AD-A278123] p 3757 N94-33269

FOREST MANAGEMENT
Extraction of forests stand age parameters from airborne imaging spectroscopy data p 3745 N94-31867
Evaluation of GER- and FLI-data with reference to forest p 3746 N94-31868

FORESTS
Carbon balance in a forest ecosystem p 3770 N94-31007
Evaluation of Fluorescence Line Imager (FLI) airborne imaging spectrometer data for roadside tree damage assessment p 3745 N94-31866
Extraction of forests stand age parameters from airborne imaging spectroscopy data p 3745 N94-31867
Research and applications of a canopy reflectance model p 3747 N94-32492
Robust multisource classification method using the Markov random field methods p 3750 N94-32537
A case study comparing multi-temporal ERS-1 SAR data and SPOT data for tropical forest mapping p 3753 N94-32556
Comparing SPOT and SIR A for mapping superficial formations in tropical forest regions: Example of the Yaoundy Region (Cameroon) p 3755 N94-32562
Effects of long-term elevated atmospheric CO2 concentrations on Pinus ponderosa
[DE94-008832] p 3769 N94-32966

FORM FACTORS
The form factors of the nucleons
[DE94-007096] p 3872 N94-32630

FORMALDEHYDE
High-temperature study of O+H2CO yields OH+HCO
[DE94-006837] p 3864 N94-31321
Cometary molecules p 3935 N94-31869
Metal ion complexation by ionizable crown ethers
[DE94-008301] p 3661 N94-32847

FORMALISM
Informal introduction to the extended affix grammar formalism and its compiler
[TR-93-19] p 3817 N94-32287
Polarized lepton-nucleon scattering
[DE94-009027] p 3875 N94-33278

FORMAT
IRIG J asynchronous ASCII time code formats
[AD-A277244] p 3681 N94-32332

FORMING TECHNIQUES
Optimization of the forming parameters of PEEK/carbon fiber composite
[ISBN-0-315-86410-9] p 3620 N94-31716

FORTRAN
Varying execution discipline to increase performance
[DE94-007844] p 3819 N94-32651
Analytic formulation for the ac electrical conductivity in two-temperature, strongly coupled, overdense plasma: FORTRAN subroutine
[DE94-009466] p 3893 N94-32915
A software architecture for multidisciplinary applications: Integrating task and data parallelism
[NASA-CR-194896] p 3820 N94-32928

FORWARD SCATTERING
Analysis of the high energy behavior of the forward scattering parameters - sigma(tot), rho and B
[DE94-006537] p 3864 N94-31310
Photoelectron diffraction and holography: Present status and future prospects
[DE94-006298] p 3712 N94-31629
Surface forward-scattered acoustic measurements and analysis
[AD-A276998] p 3788 N94-32000

FOSSIL FUELS
Environmental issues related to biomass: An overview
[DE94-007226] p 3767 N94-32784
Climate effects of anthropogenic sulfate: Simulations from a coupled chemistry/climate model
[DE94-004352] p 3767 N94-32789
National US public policy on global warming derived from optimization of energy use and environmental impact studies
[DE94-004606] p 3768 N94-32790

FOUNDATIONS
Nonlinear vibration analysis of laminated plates on linear and nonlinear elastic foundations p 3737 N94-32079

FOUR-WAVE MIXING
Near resonant absorption by atoms in intense fluctuating laser fields
[DE94-005873] p 3714 N94-31200
Degenerate four-wave mixing as a diagnostic of plasma chemistry
[DE94-008588] p 3889 N94-31766

FOURIER ANALYSIS
Frames and stable bases for shift-invariant subspaces of L(sub 2)(IR(sup d))
[AD-A276470] p 3843 N94-31474

FOURIER TRANSFORMATION
Atmospheric structure simulation: An autoregressive model for smooth geophysical power spectra with known autocorrelation function
[AD-A276691] p 3773 N94-32118
System for monitoring and analyzing field energy exposure
[AD-D016115] p 3681 N94-32625
Laser and Fourier transform spectroscopy of novel propellant molecules
[AD-A277506] p 3667 N94-33013
An experimental study of pilot/vehicle dynamics using a tilt rotor flying machine
[AD-A277516] p 3805 N94-33349

FRACTALS
Fractal and spectral analysis
[ISBN-0-315-86460-5] p 3678 N94-31796

FRACTIONATION
Mars atmospheric loss and isotopic fractionation by solar-wind-induced sputtering and photochemical escape p 3947 N94-33208

FRACTOGRAPHY
Fatigue crack propagation and fractography of 3Y-TZP and ZTA
[ISBN-0-315-86561-X] p 3736 N94-31912

FRACTURE MECHANICS
A laboratory study of multiple site damage in fuselage lap splices
[AD-A276151] p 3578 N94-31078

Reliability analysis of structural ceramics subjected to biaxial flexure p 3650 N94-31454
Modeling of fracture and damage in quasibrittle materials p 3734 N94-31479
A cross-disciplinary report on the mathematical sciences applied to materials science, part 1
[AD-A276116] p 3843 N94-31529
On the constitutive response of transversely loaded fiber composites with compliant interphases p 3619 N94-31555
Multiple-site damage in aircraft fuselage structures
[LR-729] p 3578 N94-31675
Viscoelastic fracture characterization of polymeric solids p 3652 N94-31745
Acceptance criteria for weld defects in aluminium weldments
[PB94-138575] p 3735 N94-31841
Toughening mechanisms in fiber-reinforced ceramic-matrix composites p 3622 N94-31943
A fracture mechanics methodology for characterizing the performance of flawed polymeric dielectric materials p 3654 N94-31956
Influences of pressure-sensitive yielding and non-singular stress on plane-stress elastic-plastic crack-tip fields p 3737 N94-31965
Nonlinear effects in interfacial fracture p 3737 N94-31974
Fracture mechanics and micromechanisms in fiber-reinforced composites p 3622 N94-31986
Fatigue in single crystal nickel superalloys
[AD-A276662] p 3643 N94-32047
Mechanics of the single fiber pullout problem with several interface conditions p 3623 N94-32078
Finite element analysis of MB326H Macchi wing lower spar cap fatigue cracks
[AD-A277062] p 3580 N94-32264
Mechanics of failure of high temperature metal matrix composites
[AD-A277397] p 3624 N94-32342
The cyclic fatigue behaviour of adhesive joints
[AD-A277080] p 3738 N94-32351
The effect of ductile phase (Nb) reinforcement morphology on the mechanical behavior of an intermetallic matrix (MoSi2) p 3615 N94-32500
Mechanics of cracking for composite material p 3624 N94-32501
Stage 1 behavior in a stress corrosion study of Type 304 stainless steel
[DE94-008054] p 3645 N94-32614
Reactor pressure vessel structural integrity research in the US Nuclear Regulatory Commission HSST and HSSI Programs
[DE94-006550] p 3739 N94-32771
Fracture micromechanics of continuous fiber and textile reinforced metal and ceramic matrix composites
[AD-A277434] p 3627 N94-33008
Simpler J(sub Ic) test and data analysis procedures for high strength steels
[AD-A277731] p 3648 N94-33281

FRACTURE STRENGTH
Viscoelastic fracture characterization of polymeric solids p 3652 N94-31745
Toughening mechanisms in fiber-reinforced ceramic-matrix composites p 3622 N94-31943
High-temperature deformation and fracture toughness of duplex ceramic microstructures p 3653 N94-31945
A fracture mechanics methodology for characterizing the performance of flawed polymeric dielectric materials p 3654 N94-31956
Fracture mechanics and micromechanisms in fiber-reinforced composites p 3622 N94-31986
Development of high-pressure diaphragms for the AEDC impulse tunnel
[AD-A277053] p 3588 N94-32009
Fracture and fatigue strength evaluation of multiple site damaged aircraft fuselages - curved panel testing and analysis
[AD-A277100] p 3579 N94-32015
Joining of silicon nitrides using oxynitride glasses
[DE94-008517] p 3658 N94-32517
Mechanical properties of vacuum-sintered yttria ceramics
[DE94-008138] p 3659 N94-32617
Ceramic Technology Project database
[DE94-008494] p 3659 N94-32632
Influence of volume fraction of component materials and interlayer bond strength on fracture toughness of multi-layer Al 6090-25 volume percent SiCp and Al 5182 laminates
[DE94-007141] p 3626 N94-32665
Compliance measurements of chevron notched four point bend specimen
[NASA-TM-106538] p 3740 N94-32932
Interface engineering in oxide fiber/oxide matrix composites
[AD-A277672] p 3627 N94-33029
Simpler J(sub Ic) test and data analysis procedures for high strength steels
[AD-A277731] p 3648 N94-33281

FRACTURES (MATERIALS)
Fracture micromechanics of continuous fiber and textile reinforced metal and ceramic matrix composites
[AD-A277434] p 3627 N94-33008

FRACTURING
Modeling of fracture and damage in quasibrittle materials p 3734 N94-31479
Viscoelastic fracture characterization of polymeric solids p 3652 N94-31745
Irradiation-assisted stress corrosion cracking of materials from commercial BWRs: Role of grain-boundary microchemistry
[DE94-006542] p 3643 N94-32109
Tension fracture of laminates for transport fuselage. Part 1: Material screening p 3629 N94-33130

FRAGMENTATION
Using Monte Carlo techniques and parallel processing for debris hazard analysis of rocket systems
[DE94-007250] p 3609 N94-31382
Evolution of the interface properties with temperature in the T800H/ bismaleimide composites
[ONERA-NT-1993-14] p 3619 N94-31478
Experimental measurement of dynamic failure and fragmentation properties of metals
[DE94-007377] p 3737 N94-32135

FREE ATMOSPHERE
Turbulence structure of a premixed flame in a coaxial free air jet in the presence or absence of a base flow
[ISBN-0-315-78739-2] p 3633 N94-31471

FREE CONVECTION
Steady thermal convection in multiple liquid layers p 3705 N94-31844
Renormalization group theory of Bolgiano scaling in Boussinesq turbulence
[NASA-TM-106602] p 3710 N94-33070

FREE ELECTRON LASERS
Transverse mode analysis of hole-coupled free-electron lasers
[ETN-94-96019] p 3715 N94-31532
Free electrons as a versatile source of coherent radiation
[ETN-94-96011] p 3715 N94-31545
Two-gigawatt burst-mode operation of the Intense Microwave Prototype (IMP) Free-Electron Laser (FEL) for the Microwave Tokamak Experiment (MTX)
[DE94-006613] p 3715 N94-31580
Gyrotrons and free electron lasers for atmospheric sensing
[AD-A277281] p 3718 N94-32406
Selected applications of planar permanent magnet multipoles in FEL insertion device design
[DE94-009014] p 3721 N94-32845
International Free Electron Laser Conference
[AD-A277576] p 3721 N94-33000

FREE FLOW
Hypervelocity Tunnel 9 Mach 10/14 Calibration
[AD-A275960] p 3587 N94-31318
Six degree of freedom flight dynamic model of a Mk-82 store
[AD-A277065] p 3580 N94-32362
A critical evaluation of the Reynolds stress turbulence closure for the flow of a turbulent free-stream over a turbulent boundary layer
[ISBN-0-315-75792-2] p 3707 N94-32497

FREE JETS
Shear flow control of cold and heated rectangular jets by mechanical tabs. Volume 1: Results and discussion
[NASA-CR-182296-VOL-1] p 3708 N94-32867
Shear flow control of cold and heated rectangular jets by mechanical tabs. Volume 2: Tabulated data
[NASA-CR-182296-VOL-2] p 3709 N94-32869

FREE RADICALS
Infrared and near infrared transient absorption spectroscopy of molecular free radicals
[DE94-005446] p 3632 N94-31305
A visible light initiating system for free radical promoted cationic polymerization
[AD-A277164] p 3655 N94-32069

FREE VIBRATION
Vibration localization in dual-span axially moving elastic systems p 3736 N94-31964
Nonlinear vibration analysis of laminated plates on linear and nonlinear elastic foundations p 3737 N94-32079

FREE-PISTON ENGINES
A 1050 K Stirling space engine design
[NASA-CR-182149] p 3616 N94-32866

FRENCH GUIANA
Contribution of SAR ERS1 data to study the French Guiana tropical coast environment
[BRGM-93034] p 3748 N94-32527

FRENKEL DEFECTS
Point defect production, geometry, and stability in silicon: A molecular dynamics simulation study
[DE94-008292] p 3903 N94-32411

FREQUENCIES
Variable-resolution imagery for flight simulation
[AD-A276199] p 3586 N94-31058

FREQUENCY ASSIGNMENT
Economic analysis of the hertzian spectrum
[TELECOM-93-E-012] p 3670 N94-31171
Design, development, and testing of a Network Frequency Selection Service (NFSS)
[AD-A277362] p 3680 N94-32283

FREQUENCY DISTRIBUTION
DOME: Dynamic optimization on multiprocessor engines, a statistical approach p 3807 N94-31972

FREQUENCY DIVISION MULTIPLE ACCESS
Channel and terminal description of the ACTS mobile terminal p 3599 N94-31428

FREQUENCY DIVISION MULTIPLEXING
Advanced optical fiber communication systems
[AD-A276416] p 3878 N94-31330
Long distance transmission of 15 Gb/s digital using subcarrier multiplexing and external modulation
[DE94-008298] p 3682 N94-32756

FREQUENCY HOPPING
Spread-spectrum radio systems and networks
[AD-A276449] p 3671 N94-31260
Design, development, and testing of a Network Frequency Selection Service (NFSS)
[AD-A277362] p 3680 N94-32283

FREQUENCY MODULATION
Advanced optical fiber communication systems
[AD-A276416] p 3878 N94-31330
Hubless satellite communications networks p 3600 N94-31433
Pulse-splitting and AM-FM conversion in a nonlinear dispersive medium
[AD-A277041] p 3861 N94-32262
Fiber optic continuous true time-delay modulator
[AD-D016098] p 3883 N94-32720
An experimental compact Hi-Vision VCR using metal evaporated tape
[NHK-LABS-NOTE-423] p 3683 N94-33081

FREQUENCY MULTIPLIERS
Advanced material processing for integrated-optic frequency doubling systems
[AD-A278394] p 3698 N94-33163

FREQUENCY RANGES
Model updating of vibrating systems based on measured or calculated frequency response functions
[CTH-E-93-03] p 3732 N94-31091

FREQUENCY RESPONSE
Effective computational strategy for predicting the response of complex systems
[AD-A277452] p 3740 N94-33011

FRESNEL DIFFRACTION
Structure estimation of phase objects from the diffraction near field: Microwave and model calculations
[ETN-94-95737] p 3674 N94-31608

FRETTING
Cracking induced in small fretting: Application to the case of aeronautical aluminum alloys
[ECL-92-50] p 3735 N94-31870

FRICTION
Methodology for damage study of a tube-grill contact
[ECL-92-49] p 3734 N94-31562
Cracking induced in small fretting: Application to the case of aeronautical aluminum alloys
[ECL-92-50] p 3735 N94-31870
Computational methods for frictional contact with applications to the Space Shuttle orbiter nose-gear tire p 3608 N94-32295
New micro- and macroscopic models of contact and friction
[AD-A277240] p 3726 N94-32320
The effect of prolonged exposure to 750 C air on the tribological performance of PM212
[NASA-TM-106472] p 3617 N94-32941

FRICTION DRAG
Flight test results of riblets at supersonic speeds
[NASA-TM-4387] p 3572 N94-32880

FRICTION FACTOR
Computational methods for frictional contact with applications to the Space Shuttle orbiter nose-gear tire p 3608 N94-32295
Mechanics of failure of high temperature metal matrix composites
[AD-A277397] p 3624 N94-32342
Frictional behavior and adhesion of Ag and Au films applied to aluminum oxide by oxygen-ion assisted Screen Cage Ion Plating (SCIP)
[NASA-TM-106522] p 3647 N94-32931
Energy absorber for the CETA p 3604 N94-33303

FROST
One: Microphysics of frost metamorphism: Applications to Triton and Mars. Two: A global analysis of the ozone deficit in the upper stratosphere and lower mesosphere. Three: The diabatic circulation in the stratosphere as diagnosed from Microwave Limb Sounder data
p 3942 N94-31975
The influence of thermal inertia on Mars' seasonal pressure variation and the effect of the weather component p 3952 N94-33238
FUEL CELL POWER PLANTS
Economic feasibility analysis of distributed electric power generation based upon the natural gas fired fuel cell
[DE94-005795] p 3759 N94-31487
Detailed design of the 2MW Demonstration Plant
[DE94-000042] p 3762 N94-32823
FUEL CELLS
NEMO: Advanced energy systems and technologies
[DE94-721998] p 3760 N94-31767
Polymer electrolyte fuel cells
[DE94-007558] p 3761 N94-32762
FUEL COMBUSTION
Ignition studies in nonpremixed hydrogen/air combustion
[AD-A275954] p 3632 N94-31348
Emissions of greenhouse gases from the use of transportation fuels and electricity
[DE94-006166] p 3765 N94-31625
Soot and liquid-phase fuel distributions in a newly designed optically accessible DI diesel engine
[DE94-005648] p 3723 N94-31651
Climate effects of anthropogenic sulfate: Simulations from a coupled chemistry/climate model
[DE94-004352] p 3767 N94-32789
Ignition delays, heats of combustion, and reaction rates of aluminum alkyl derivatives used as ignition and combustion enhancers for supersonic combustion
[NASA-CR-189581] p 3638 N94-32868
FUEL CONSUMPTION
National US public policy on global warming derived from optimization of energy use and environmental impact studies
[DE94-004606] p 3768 N94-32790
FUEL INJECTION
Computational study of single-expansion-ramp nozzles with external burning
[NASA-TM-106550] p 3700 N94-31229
FUEL PRODUCTION
Development of a catalytic system for gasification of wet biomass
[DE94-006216] p 3759 N94-31762
FUEL SPRAYS
Soot and liquid-phase fuel distributions in a newly designed optically accessible DI diesel engine
[DE94-005648] p 3723 N94-31651
FUEL TANKS
Improved resealing procedures for the second deseal/reseal program in RAAF F111 aircraft fuel tanks
[AD-A277069] p 3580 N94-32378
FULLERENES
Theoretical studies of zirconium and carbon clusters with molecular dynamics simulations
[DE94-005276] p 3862 N94-31146
Occupied and unoccupied orbitals of C60 and C70
[DE94-008294] p 3873 N94-32755
FUNCTION SPACE
Comparing models of the non-extensional typed lambda-calculus
[ML-93-19] p 3842 N94-31409
FUNCTIONAL DESIGN SPECIFICATIONS
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-flight controls module, volume 3
[AD-A276970] p 3590 N94-32395
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-flight dynamics module, volume 4
[AD-A276971] p 3590 N94-32396
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-propulsion module propulsion module, volume 5
[AD-A276972] p 3590 N94-32397
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-navigation/communication module, volume 6
[AD-A276973] p 3590 N94-32398
Modular Simulator System (MSS). System/segment specification for the generic modular simulator system-weapons module, volume 7
[AD-A276974] p 3590 N94-32399
Development of a video fluorescence system for assessing burn depth
[AD-A278127] p 3798 N94-33092
Faultless software project
[AD-A278161] p 3822 N94-33188
Structuring Z specifications with views
[AD-A277618] p 3822 N94-33279
MODIS. Volume 1: MODIS level 1A software baseline requirements
[NASA-TM-104594-VOL-1] p 3823 N94-33287
FUNCTIONALS
The Laplace functional and Palm measure of a quasi-Cox process which is driven by a Markov chain
[REPT-93-82] p 3851 N94-31699
FUNCTIONS (MATHEMATICS)
Strictly positive definite functions on spheres
[AD-A276471] p 3855 N94-31244
The Cameron-Martin theorem
[W-9315] p 3844 N94-31676
Algebraic functions for recognition
[AD-A276803] p 3846 N94-32167
FURANS
The intramolecular cyclization of bis-2,5-dimethylene-2,5-dihydrofurans and bis-2,5-dimethylene-2,5-dihydrothiophenes: An approach to macrocycles
[DE94-007060] p 3657 N94-32377
FUSELAGES
A laboratory study of multiple site damage in fuselage lap splices
[AD-A276151] p 3578 N94-31078
Damage tolerance aspects of a full composite airplane fuselage: Requirements, modelling, predictions, experiments
[LR-728] p 3578 N94-31674
Multiple-site damage in aircraft fuselage structures
[LR-729] p 3578 N94-31675
Fracture and fatigue strength evaluation of multiple site damaged aircraft fuselages - curved panel testing and analysis
[AD-A277100] p 3579 N94-32015
Shearographic inspection of a DeHavilland DHC-7
[AD-A276716] p 3566 N94-32157
Improved resealing procedures for the second deseal/reseal program in RAAF F111 aircraft fuel tanks
[AD-A277069] p 3580 N94-32378
Application of a design-build-team approach to low cost and weight composite fuselage structure
[NASA-CR-4418] p 3626 N94-32863
Computation of three-dimensional compressible boundary layers to fourth-order accuracy on wings and fuselages
[NASA-CR-4269] p 3709 N94-32871
Composite fuselage shell structures research at NASA Langley Research Center p 3628 N94-33124
Resin transfer molding for advanced composite primary wing and fuselage structures p 3628 N94-33128
Test and analysis results for composite transport fuselage and wing structures p 3628 N94-33129
Tension fracture of laminates for transport fuselage. Part 1: Material screening p 3629 N94-33130
Local design optimization for composite transport fuselage crown panels p 3629 N94-33132
Composite fuselage crown panel manufacturing technology p 3629 N94-33133
Advanced textile applications for primary aircraft structures p 3629 N94-33135
Characterization and manufacture of braided composites for large commercial aircraft structures
p 3630 N94-33137
An experimental study of pilot/vehicle dynamics using a tilt rotor flying machine
[AD-A277516] p 3805 N94-33349
FUSION REACTORS
Spectroscopy and atomic physics in EBIT and SuperEBIT
[DE94-006050] p 3864 N94-31508
Magnetless magnetic fusion
[DE94-007114] p 3891 N94-32686
FUZZY SETS
Triangular norms and conorms: A general tool for generating fuzzy mathematical morphologies
[TELECOM-93-D-001] p 3839 N94-31092
FUZZY SYSTEMS
Fuzzy logic application for modeling man-in-the-loop space shuttle proximity operations
[NASA-CR-188283] p 3835 N94-32359
Refining fuzzy logic controllers with machine learning
p 3839 N94-32421
A fuzzy classifier system for process control
p 3839 N94-32422
Fuzzy-neural control of an aircraft tracking camera platform p 3839 N94-32423
Intelligent control of a multi-degree-of freedom reaction compensating platform system using fuzzy logic
p 3605 N94-33306

G

GADOLINIUM
Laser flash photolysis, EPR and Raman studies of liquids at elevated pressures
[DE94-008351] p 3718 N94-32413
GADOLINIUM-GALLIUM GARNET
Transient radiation-induced absorption in the materials for a GSGG laser
[DE94-005316] p 3714 N94-31148
GALACTIC BULGE
The chemical and dynamical evolution of the galaxy
p 3936 N94-31950
GALACTIC CLUSTERS
Theoretical studies of x ray emission from clusters of galaxies p 3954 N94-31103
The kinematics of dense clusters of galaxies
p 3937 N94-32029
GALACTIC COSMIC RAYS
Neutron measurements at the commercial aircraft altitudes
[ISBN-0-315-86201-7] p 3955 N94-31709
GALACTIC EVOLUTION
Fireworks in velocity and configuration space applied to cosmology
[USIP-93-90] p 3927 N94-31086
The stellar and gaseous content of massive low surface brightness disk galaxies p 3933 N94-31495
Gravitational effects of cosmic strings
[ISBN-0-315-75484-2] p 3934 N94-31789
Ionized gas in the halos of edge-on infrared-bright galaxies: Evidence for starburst-driven superwinds
p 3936 N94-31948
The chemical and dynamical evolution of the galaxy
p 3936 N94-31950
The role of galaxy type and environment in determining the properties of globular cluster systems
[ISBN-0-315-76447-3] p 3939 N94-33112
GALACTIC HALOS
Ionized gas in the halos of edge-on infrared-bright galaxies: Evidence for starburst-driven superwinds
p 3936 N94-31948
The chemical and dynamical evolution of the galaxy
p 3936 N94-31950
GALACTIC NUCLEI
The manifestations of energetic activity in the galactic center p 3937 N94-32028
GALACTIC RADIATION
Theoretical studies of x ray emission from clusters of galaxies p 3954 N94-31103
Line-strength gradients and kinematic profiles in elliptical galaxies p 3934 N94-31788
GALACTIC ROTATION
Line-strength gradients and kinematic profiles in elliptical galaxies p 3934 N94-31788
GALACTIC STRUCTURE
The chemical and dynamical evolution of the galaxy
p 3936 N94-31950
A study of the neutral hydrogen distribution of the Milky Way through 21 cm emission and Lyman alpha absorption p 3938 N94-32309
GALAXIES
A twisted disk equation that describes warped galaxy disks p 3928 N94-31118
The chemical and dynamical evolution of the galaxy
p 3936 N94-31950
The role of galaxy type and environment in determining the properties of globular cluster systems
[ISBN-0-315-76447-3] p 3939 N94-33112
GALERKIN METHOD
An adaptive finite element method for unsteady compressible rotor airfoil aerodynamics
p 3567 N94-31204
Penetrable wedge analysis
[AD-A277219] p 3845 N94-32022
GALILEO SPACECRAFT
The Galileo high gain antenna deployment anomaly
p 3607 N94-33319
GALLIUM ALLOYS
Phase relationships and stability of the (mu)- and (zeta)-phases in the Ag-Al-X (X=Zn, Ga, Ge) systems
[DE94-009391] p 3648 N94-33270
GALLIUM ARSENIDES
New material for high average power infrared generation: QPM-DB GaAs
[AD-A276389] p 3714 N94-31358
The relationship of the electronic structures of semiconductor surfaces and heterostructures to crystal growth
[AD-A276465] p 3896 N94-31473
High-performance GaAs/AlGaAs optical phase modulators for microwave/photonic integrated circuits
[DE94-006361] p 3688 N94-31483

GaAs/GaN strained layer superlattice materials for high temperature transistors, phase 1
[AD-A276115] p 3897 N94-31528
The effects of amorphous layer regrowth on carbon activation in GaAs and InP
[DE94-006290] p 3899 N94-31634
Photopyroelectric spectroscopy as a non-intrusive technique for the determination of the optical absorption spectra of multiple quantum well samples
[ISBN-0-315-87164-4] p 3833 N94-31875
Novel optoelectronic devices based on combining GaAs and InP on Si
[AD-A277018] p 3693 N94-32301
Radiation tolerant, high speed, low power, gallium arsenide logic
[AD-A277293] p 3694 N94-32509
Femtosecond probe-probe transmission studies of LT-grown GaAs near the band edge
[DE94-006660] p 3904 N94-32634
Research on high reliability refractory ohmic contacts for GaAs FETs and MODFETs
[AD-A276848] p 3697 N94-33034
Electrical characteristics of GaAs MESFET fabrication by ion implantation of Si or Se
[AD-A278416] p 3909 N94-33328

GALLIUM NITRIDES
GaAs/GaN strained layer superlattice materials for high temperature transistors, phase 1
[AD-A276115] p 3897 N94-31528

GAME THEORY
Effective truth
[ML-93-15] p 3856 N94-31416
Carbon dioxide abatement as a differential game
[DE94-722023] p 3765 N94-32590

GAMMA RAY ASTRONOMY
A search for 100 TeV gamma ray emission from the x ray binary pulsar 4U 0115+63 using the CYGNUS extensive air-shower array p 3955 N94-31900
BATSE data analysis
[NASA-CR-195818] p 3927 N94-32942

GAMMA RAY BURSTS
A search for 100 TeV gamma ray emission from the x ray binary pulsar 4U 0115+63 using the CYGNUS extensive air-shower array p 3955 N94-31900
Gamma-ray optical counterpart search experiment (GROCSE)
[DE94-007124] p 3955 N94-32129
BATSE data analysis
[NASA-CR-195818] p 3927 N94-32942
Nuclear physics and astrophysics
[DE94-007168] p 3939 N94-33147

GAMMA RAY TELESCOPES
Gamma Large Area Silicon Telescope (GLAST)
[DE94-006439] p 3925 N94-31786
Gamma-ray optical counterpart search experiment (GROCSE)
[DE94-007124] p 3955 N94-32129

GAMMA RAYS
Gamma Large Area Silicon Telescope (GLAST)
[DE94-006439] p 3925 N94-31786

GAS ANALYSIS
In-bed multiport sampling system
[AD-A275908] p 3763 N94-31339
The origin of neon-E: Neon-E in single interstellar silicon carbide and graphite grains p 3933 N94-31556
Rate coefficient for the reaction H + O2 yields OH + O: Results from 2000 to 5300 K
[DE94-008105] p 3871 N94-32615

GAS CHROMATOGRAPHY
In-bed multiport sampling system
[AD-A275908] p 3763 N94-31339
Group 12 thiolates: Syntheses, characterization and decomposition pathways
[AD-A277055] p 3900 N94-32011
New zinc-bis(dialkylamides) potentially usable as site-selective dopants for p-type ZnSe
[AD-A276947] p 3902 N94-32218

GAS COMPOSITION
The ozone and the physico-chemical processes in tropical regions p 3770 N94-31010
Photothermal laser deflection, an innovative technique to measure particles in exhausts
[AD-A277151] p 3718 N94-32366
Mexico City ozone concentrations as a function of readily-available meteorological parameters
[DE94-007576] p 3768 N94-32814

GAS DENSITY
Using laser absorption spectroscopy to monitor composition and physical properties of metal vapors
[DE94-001530] p 3716 N94-31599
CO observations in external galaxies and gas mass determination p 3925 N94-31790

GAS DISCHARGES
Time evolution and filamentation of KrF(star) laser gas discharges
[ETN-94-95758] p 3715 N94-31561

GAS DISSOCIATION
Production and detection of metastable atomic oxygen
[ISBN-0-315-87364-7] p 3868 N94-31915
Implementation of a vibrationally linked chemical reaction model for DSMC
[NASA-TM-109109] p 3710 N94-33020

GAS DYNAMICS
Gas dynamics for accretion disk simulations p 3932 N94-31144
Stability and instability criteria for magnetohydrodynamics
[PB94-148475] p 3889 N94-31772
Basic and applied studies of the ram accelerator as a hypervelocity projectile launcher
[AD-A277392] p 3602 N94-32288

GAS EXPANSION
Pulsed expansion of plasma in a magnetic thruster p 3889 N94-31776
Chemical vapor deposition fluid flow simulation modelling tool
[NASA-CR-189648] p 3707 N94-32480

GAS FLOW
The manifestations of energetic activity in the galactic center p 3937 N94-32028

GAS INJECTION
Control of hypersonic aerodynamic forces with surface blowing p 3567 N94-31216

GAS LASERS
DOE reactor-pumped laser program
[DE94-006372] p 3715 N94-31485

GAS MIXTURES
A numerical method for mixing/chemically reacting compressible flow with finite rate chemistry p 3634 N94-31824

GAS PRESSURE
Dynamics of flux tubes in accretion disks p 3932 N94-31142
Advanced thermally stable jet fuels
[DE94-006760] p 3667 N94-32150

GAS TRANSPORT
Computed potential energy surfaces for chemical reactions
[NASA-CR-195835] p 3639 N94-33036

GAS TUNGSTEN ARC WELDING
Development of an automated wire delivery system for robotic welding applications
[NASA-CR-194216] p 3727 N94-32479

GAS TURBINE ENGINES
Thermal-mechanical fatigue crack growth in aircraft engine materials
[ISBN-0-315-86543-1] p 3734 N94-31707
Photothermal laser deflection, an innovative technique to measure particles in exhausts
[AD-A277151] p 3718 N94-32366
Materials development program: Ceramic technology project bibliography, 1984-1992
[DE94-009297] p 3662 N94-32935

GAS TURBINES
Rotordynamic effects driven by fluid forces from a geometrically imperfect labyrinth
[AD-A276424] p 3722 N94-31333
Fatigue in single crystal nickel superalloys
[AD-A276662] p 3643 N94-32047
Materials development program: Ceramic technology project bibliography, 1984-1992
[DE94-009297] p 3662 N94-32935

GAS-METAL INTERACTIONS
Prediction of hydrogen entry and permeation in metals and alloys
[AD-A276637] p 3642 N94-31995
Chemisorbed-molecule potential-energy surfaces and electronically-stimulated processes
[DE94-007932] p 3719 N94-32603
Metal cluster-rare gas van der Waals complexes: Microscopic models of physisorption
[DE94-008134] p 3873 N94-32797

GASIFICATION
Development of a catalytic system for gasification of wet biomass
[DE94-006216] p 3759 N94-31762
Biological conversion of synthesis gas
[DE94-000094] p 3760 N94-31811

GASKETS
Compatibility of refrigerants and lubricants with elastomers
[DE94-008552] p 3658 N94-32518

GATES (CIRCUITS)
Advanced silicon technology for microwave circuits
[AD-A278039] p 3698 N94-33091
Design of free space interconnected signal processor
[AD-A278129] p 3683 N94-33093

GAUGE INVARIANCE
CP violation and the top quark
[DE94-008930] p 3874 N94-32841

GAUGE THEORY
High energy physics studies
[DE94-005970] p 3876 N94-31505
SU(2) WZNW model at higher genera from gauge field functional integral
[PB94-148467] p 3857 N94-31589
Perturbative aspects of lower-dimensional gauge theories
[ISBN-0-315-86269-6] p 3911 N94-31712
The Kaluza-Klein approach and gauge supersymmetry
[ISBN-0-315-86553-9] p 3912 N94-31911
Tensor gauge potentials in loop space formulation of Yang-Mills fields
[PB94-147147] p 3912 N94-31924
CP violation and the top quark
[DE94-008930] p 3874 N94-32841

GEAR TEETH
Manual for automatic generation of finite element models of spiral bevel gears in mesh
[NASA-CR-191009] p 3728 N94-32900
A procedure for 3-D contact stress analysis of spiral bevel gears
[NASA-CR-194472] p 3728 N94-32929

GEARS
Manual for automatic generation of finite element models of spiral bevel gears in mesh
[NASA-CR-191009] p 3728 N94-32900
Feed-forward control of gear mesh vibration using piezoelectric actuators
[NASA-TM-106366] p 3728 N94-32902
A procedure for 3-D contact stress analysis of spiral bevel gears
[NASA-CR-194472] p 3728 N94-32929
Spur, helical, and spiral bevel transmission life modeling
[NASA-TM-106552] p 3728 N94-32979

GELS
Vibration dampener and method for making same
[AD-D016094] p 3739 N94-32733

GENERAL OVERVIEWS
Summary of materials and hardware performance on LDEF p 3595 N94-31037
A comparison of product realization frameworks
[AD-A275992] p 3810 N94-31357
Mars: Five views on what is known
[NASA-TM-109751] p 3942 N94-31805
Recent developments in polymeric charge transfer complexes
[AD-A277108] p 3654 N94-31979
Sandia's photonic program and its changing national role
[DE94-008616] p 3883 N94-32878

GENETIC ALGORITHMS
On the use of genetic algorithms to solve the time-table problem
[REPT-90-060-REV] p 3829 N94-31176
A genetic algorithm based method for docking flexible molecules
[DE94-007525] p 3793 N94-32269

GENETICS
Laboratory Directed Research & Development Program
[DE94-005928] p 3956 N94-31523

GEOCENTRIC COORDINATES
World height system definition and implementation
[AD-A276725] p 3747 N94-32160

GEOCHEMISTRY
Origin and thermal evolution of Mars p 3940 N94-31109

GEODETIC SURVEYS
World height system definition and implementation
[AD-A276725] p 3747 N94-32160
Remote sensing and the Mississippi high accuracy reference network p 3758 N94-32466

GEODYNAMICS
The tectonic and volcanic evolution of Venus: Catastrophic or gradual? p 3940 N94-31111

GEOGRAPHIC INFORMATION SYSTEMS
Remote sensing for urban planning p 3758 N94-32465
Remote sensing and the Mississippi high accuracy reference network p 3758 N94-32466
The contribution of satellite data in communication infrastructure projects p 3749 N94-32530

GEOIDS
Filtering of satellite altimetry data with optimal smoothing cubic splines to compute geoid heights, along-tract geoid and gravity gradients in the Indonesian waters and its surroundings
[PB94-147527] p 3741 N94-31074
Application of radon transformation for improved analysis of sparsely sampled data: A feasibility study
[PB94-147535] p 3741 N94-31075
Geoid-to-topography ratios on Venus: A global perspective p 3940 N94-31110

GEOLOGICAL FAULTS
Tectonic History of the Terrestrial Planets
[NASA-CR-195696] p 3939 N94-31105
Patterns of deformation and volcanic flows associated with lithospheric loading by large volcanoes on Venus
p 3776 N94-31106
Aspects of modelling the tectonics of large volcanoes on the terrestrial planets p 3940 N94-31107
State of stress, faulting, and eruption characteristics of large volcanoes on Mars p 3940 N94-31108
Plains tectonism on Venus: The deformation belts of Lavinia Planitia p 3941 N94-31115
Respective contributions of VIS-PIR, SAR-ERS 1, and airborne radar data for morphostructural and morphoneotectonic analysis: Practical examples
p 3752 N94-32549
Use of SPOT and ERS-1 SAR data to study the tectonic and climatic history of arid regions p 3752 N94-32550

GEOLOGICAL SURVEYS
The effects of vegetation on the ability to map soils using GERIS data p 3744 N94-31860
Investigation on correction models for airborne imaging spectrometry data from the EISAC-campaign for geoscientific purposes p 3745 N94-31861
Contribution of SAR ERS1 data to study the French Guiana tropical coast environment
[BRGM-93034] p 3748 N94-32527
Comparison of SPOT, ERS-1, SEASAT, LANDSAT TM, and merged imagery for geological investigations
p 3752 N94-32547
Optimal geological data extraction from SPOT-radar synergism with samples from Djebel Amour (Algeria), Red Sea Hills (Sudan), Sirte Basin (Libya), and Magdalena Valley (Colombia) p 3752 N94-32548
Structural study in an alteritic region: Contribution of ERS-1 SAR data of the Mauges Plateau (Loire Atlantique, France)
[BRGM-93032] p 3752 N94-32551
The Lunar Scout Program: An international program to survey the Moon from orbit for geochemistry, mineralogy, imagery, geodesy, and gravity
[NASA-TM-104791] p 3943 N94-32923

GEOMAGNETISM
Magnetohydrodynamics of the Earth's core. 1: Steady, rotating magnetoconvection. 2: Magnetic Rossby waves
p 3770 N94-31104
Lightning-induced coupling of the radiation belts to geomagnetically conjugate ionospheric regions
p 3772 N94-31773

GEOMETRIC RECTIFICATION (IMAGERY)
Analysis of GER imaging spectrometry data for the identification of soil and vegetation parameters in land degradation studies p 3744 N94-31857
Optimal geological data extraction from SPOT-radar synergism with samples from Djebel Amour (Algeria), Red Sea Hills (Sudan), Sirte Basin (Libya), and Magdalena Valley (Colombia) p 3752 N94-32548

GEOMETRY
Interactive reconstruction of anatomical structures with free-form surfaces
[TELECOM-93-E-002] p 3794 N94-31195

GEOMORPHOLOGY
Plains tectonism on Venus: The deformation belts of Lavinia Planitia p 3941 N94-31115
Contribution of SAR ERS1 data to study the French Guiana tropical coast environment
[BRGM-93034] p 3748 N94-32527
Respective contributions of VIS-PIR, SAR-ERS 1, and airborne radar data for morphostructural and morphoneotectonic analysis: Practical examples
p 3752 N94-32549
Quantitative modeling of bottom morphology and subbottom properties
[AD-A278142] p 3790 N94-33062
Distribution and nature of UV absorbers on Triton's surface
[NASA-CR-195886] p 3943 N94-33104

GEOPHYSICAL FLUIDS
Magnetohydrodynamics of the Earth's core. 1: Steady, rotating magnetoconvection. 2: Magnetic Rossby waves
p 3770 N94-31104

GEOPHYSICS
Magnetohydrodynamics of the Earth's core. 1: Steady, rotating magnetoconvection. 2: Magnetic Rossby waves
p 3770 N94-31104
Origin and thermal evolution of Mars
p 3940 N94-31109
A tectonic resurfacing model for Venus
p 3941 N94-31113
Proceedings of the International Workshop on Artificial Intelligence Applications in Solar-Terrestrial Physics
[PB94-142064] p 3832 N94-31808
Atmospheric structure simulation: An autoregressive model for smooth geophysical power spectra with known autocorrelation function
[AD-A276691] p 3773 N94-32118

GEOPOTENTIAL HEIGHT
Filtering of satellite altimetry data with optimal smoothing cubic splines to compute geoid heights, along-tract geoid and gravity gradients in the Indonesian waters and its surroundings
[PB94-147527] p 3741 N94-31074

GEOSAT SATELLITES
Error analysis of real-time and post-processed orbit determination for the Geosat Follow-On altimetric satellite using GPS tracking p 3576 N94-31845
The effects of altimeter sampling characteristics: Some Geosat examples
[AD-A276899] p 3747 N94-32214

GEOTHERMAL ENERGY UTILIZATION
Renewable energy technology development at Sandia National Laboratories
[DE94-007734] p 3761 N94-32383

GERMANATES
Extended-range order in glasses
[DE94-008135] p 3661 N94-32798

GERMANIUM
An extended approach to oxidations and nitridations of Si and Ge(x)Si(1-x) materials
[AD-A276056] p 3631 N94-31282
Oriented Si and Ge nanocrystals formed in Al2O3 by ion implantation and annealing
[DE94-005593] p 3901 N94-32172
Lowering the Schottky barrier at metal or silicide/Si interfaces to extend the range of infrared detectors
[AD-A277253] p 3903 N94-32322
Intra-cascade surface recombination of point defects during ion bombardment of Ge(001)
[DE94-007740] p 3903 N94-32384
Ab initio study of the epitaxial growth of Ge on Si(100) surface
[DE94-007245] p 3904 N94-32724

GERMANIUM ALLOYS
Anomalous small angle x ray scattering studies of amorphous metal-germanium alloys
[DE94-007258] p 3900 N94-32065
Research on stable, high-efficiency amorphous silicon multijunction modules
[DE94-000298] p 3695 N94-32680
Anisotropic phase separation through the metal-insulator transition in amorphous Mo-Ge and Fe-Ge alloys
[DE94-007259] p 3646 N94-32795
Phase relationships and stability of the (mu)- and (zeta)-phases in the Ag-Al-X (X=Zn, Ga, Ge) systems
[DE94-009391] p 3648 N94-33270

GERMANIUM COMPOUNDS
Amorphous/crystalline structure and phase transformations in metastable semiconducting Ge(1-x)Sn(x)
[DE94-006659] p 3901 N94-32115

GERMANIUM OXIDES
Extended-range order in glasses
[DE94-008135] p 3661 N94-32798

GETTERS
Gettering of metal impurities by cavities in silicon
[DE94-005248] p 3645 N94-32672

GIANT STARS
A critical examination of stellar atmosphere theory for metal-poor K-giant stars p 3927 N94-32308

GIMBALS
High precision moving magnet chopper for variable operation conditions p 3605 N94-33307

GLACIERS
Estimation of visible and near-infrared reflectivity for Peyto Glacier Basin using satellite data
[ISBN-0-315-87039-7] p 3743 N94-31733
Feasibility in the use of satellite remote sensing data as a fast reaction tool for natural disaster relief
p 3748 N94-32526
Study of subpolar glaciers of Spitzbergen using SPOT, ERS-1, and hypsometric data: Results and perspectives
p 3753 N94-32553

GLACIOLOGY
A reassessment of the in-situ dielectric constant of polar firn
[AD-A276999] p 3773 N94-32154

GLASS
Physical properties of glasses exposed to Earth-facing and trailing-side environments on LDEF
p 3594 N94-31030
Analysis of leading edge and trailing edge cover glass samples before and after treatment with advanced satellite contamination removal techniques p 3596 N94-31041
Transient radiation-induced absorption in the materials for a GSGG laser
[DE94-005316] p 3714 N94-31148
Cost-effective ceramic machining: Summary of three-body wear experiments
[DE94-007757] p 3650 N94-31354
In-situ TEM crystallization of anorthite-glass films on (alpha)-Al2O3
[DE94-006317] p 3652 N94-31780
Elastic modulus measurements of LDEF glasses and glass-ceramics using a speckle technique
[NASA-CR-195911] p 3653 N94-31851
Toughening mechanisms in the high strain rate deformation of rubber-modified polymer glasses
p 3653 N94-31942
Determination of BPSG thin-film properties using IR reflection spectroscopy of product wafers
[DE94-006591] p 3634 N94-32110
Joining of silicon nitrides using oxynitride glasses
[DE94-008517] p 3658 N94-32517
Metal-ion spin-on glasses: Novel materials for active waveguides
[DE94-007738] p 3882 N94-32649
Inorganic polymer engineering materials
[DE94-008519] p 3659 N94-32655
Conductive paints
[DE94-008508] p 3661 N94-32788
Extended-range order in glasses
[DE94-008135] p 3661 N94-32798

GLASS FIBER REINFORCED PLASTICS
Micromechanical analysis of the interface and basic damage modes in glass fiber/epoxy resin model composites
[ONERA-NT-1993-4] p 3618 N94-31225
Fatigue behavior of unidirectional pultruded composite materials
[ISBN-0-315-86425-7] p 3621 N94-31719
Empirical optimization of the consolidation of thermoplastic prepregs
[ISBN-0-315-86455-9] p 3652 N94-31722
Bond stress-slip characteristics of FRP rebars
[AD-A277191] p 3623 N94-32070

GLASS FIBERS
Micromechanical analysis of the interface and basic damage modes in glass fiber/epoxy resin model composites
[ONERA-NT-1993-4] p 3618 N94-31225
Inorganic polymer engineering materials
[DE94-008519] p 3659 N94-32655

GLOBAL POSITIONING SYSTEM
Results of real-time testing and demonstration of the US Army Corps of Engineers real-time on-the-fly positioning system
[AD-A276160] p 3576 N94-31080
An investigation of airborne GPS/INS for high accuracy position and velocity determination
[DE94-006139] p 3576 N94-31306
Flight technical error for category B non-precision approaches and missed approaches using non-differential GPS for course guidance
[PB94-142734] p 3576 N94-31680
Error analysis of real-time and post-processed orbit determination for the Geosat Follow-On altimetric satellite using GPS tracking p 3576 N94-31845
Theoretical basis for state vector comparison, relative position display, and relative position/rendezvous prediction
[AD-A277216] p 3608 N94-32020
Remote sensing and the Mississippi high accuracy reference network p 3758 N94-32468
Performance analysis of an integrated GPS/inertial attitude determination system
[NASA-CR-188289] p 3577 N94-32864
Real-time centimeter positioning with GPS: A system developed by the US Army Corps of Engineers
[AD-A278152] p 3577 N94-33095
An evaluation of three GPS receivers for use in the GPS sounder
[AD-A278157] p 3577 N94-33253

GLOBAL WARMING
National US public policy on global warming derived from optimization of energy use and environmental impact studies
[DE94-004606] p 3768 N94-32790
Quantified estimates of total GWPs for greenhouse gases taking into account tropospheric chemistry
[DE94-007846] p 3768 N94-32817
Ocean variability and its influence on the detectability of greenhouse warming signals
[DE94-008670] p 3790 N94-32881
Current policies of the major countries coping with the global warming problem and the energy demand and supply
[DE94-757291] p 3769 N94-32920

GLOBULAR CLUSTERS
The role of galaxy type and environment in determining the properties of globular cluster systems
[ISBN-0-315-76447-3] p 3939 N94-33112

GLUCOSE
Perspectives of glucose sensing based on a charge-modulating competition reaction
[ISBN-9-09-005754-4] p 3795 N94-31652

Electrical communication between glucose oxidase and electrodes based on poly(vinylimidazole) complex of Os(bpy)2Cl2
[AD-A276585] p 3635 N94-32231

GLUONS
Transport properties of quark and gluon plasmas
[DE94-007043] p 3864 N94-31405

GOGGLES
Night vision camcorder system
[AD-A277004] p 3712 N94-32002
Assessment of interior modifications in C-130 and C-141 aircraft for night vision goggle operations
[AD-A276843] p 3582 N94-32223
Methods for measuring characteristics of night vision goggles
[AD-A277046] p 3804 N94-32302
An evaluation framework for designing a night vision, computer-based trainer
[AD-A278005] p 3590 N94-33139

GOLD
The adsorption of sulfate on gold(111) in acidic aqueous media: Adlayer structural inferences from infrared spectroscopy and scanning tunneling microscopy
[AD-A276643] p 3642 N94-31997
A new-type of long-range restructuring of ordered metal surfaces induced by lateral adsorbate interactions: Iodide on AU(110) electrodes
[AD-A276633] p 3643 N94-32060
Charge-dependent atomic-scale structures of high-index and (110) gold electrode surfaces as revealed by scanning tunneling microscopy
[AD-A276782] p 3869 N94-32170
Nanoscale structural changes upon electrooxidation of Au(111) as probed by potentiodynamic scanning tunneling microscopy
[AD-A276780] p 3909 N94-33275

GOLD ISOTOPES
Transverse energy production with Si and Au beams at AGS energy: Towards hot and dense hadronic matter
[DE94-007178] p 3938 N94-32638
A tandem microscopic-electrochemical examination of a charge-induced surface phase sequence: Ordered Au(110) in aqueous iodide electrolytes as probed by potentiodynamic scanning tunneling microscopy
[AD-A276905] p 3875 N94-33277

GOVERNMENT/INDUSTRY RELATIONS
Information resources for US Department of Energy pollution prevention programs
[DE94-006677] p 3763 N94-31582
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 18: Scientific and Technical Information (STI) policy and the competitive position of the US aerospace industry
[NASA-TM-109782] p 3921 N94-32833

GRAIN BOUNDARIES
Defect-solute interactions near irradiation grain boundaries
[DE94-006215] p 3641 N94-31627
Irradiation-assisted stress corrosion cracking of materials from commercial BWRs: Role of grain-boundary microchemistry
[DE94-006542] p 3643 N94-32109
Attempts to model the generation of new grain boundaries during the deformation of polycrystals
[DE94-007527] p 3903 N94-32597
Effect of twin boundary density on the vortex melting transition in YBa2Cu3O(7-delta) single crystals
[DE94-007684] p 3904 N94-32601
Boron and hydrogen in Ni3Al. Part 2: Mechanical testing of bicrystals
[DE94-007441] p 3904 N94-32606
Characterization of nanoparticles and nanophase materials
[DE94-008348] p 3907 N94-32990
The path for long range conduction in high J(sub c) TlBa2Ca2Cu3O(8+x) spray-pyrolyzed deposits
[DE94-007211] p 3909 N94-33271

GRAIN SIZE
Work hardening behavior in aluminum alloy 2090
[DE94-007036] p 3643 N94-32064

GRAMMARS
On the equivalence of Lambek categorial grammars and basic categorial grammars
[LP-93-07] p 3842 N94-31451
Informal introduction to the extended affix grammar formalism and its compiler
[TR-93-19] p 3817 N94-32287

GRANULAR MATERIALS
Processing of novel nanoparticle dispersion strengthened ceramics for improved mechanical performance
[AD-A275965] p 3649 N94-31276
Contributions to the validation of the CJS model for granular materials
[ECL-92-56] p 3733 N94-31376

GRAPH THEORY
Scheduling techniques for multiple processor systems in real-time environments
[AD-A276149] p 3824 N94-31249
Polyhedric object recognition by indexing in a model base
[ETN-94-95913] p 3812 N94-31542
Some calculations on supersymmetric graphs as communication networks
[REPT-93-72] p 3824 N94-31641

GRAPHICAL USER INTERFACE
Automatic generation of context-sensitive textual help
[REPT-93-68] p 3812 N94-31646
Interactive graphical model building using telepresence and virtual reality
[DE94-001421] p 3818 N94-32353
Knowledge-based commodity distribution planning p 3915 N94-32427
On the implementation of error handling in dynamic interfaces to scientific codes
[DE94-006970] p 3818 N94-32585
The role of guideline-based design tools
[DE94-007482] p 3804 N94-32596
Design of graphic screens using Neuro Linguistic Programming
[DE94-007634] p 3819 N94-32599
Implementation and display of Computer Aided Design (CAD) models in Monte Carlo radiation transport and shielding applications
[DE94-007221] p 3819 N94-32641

GRAPHITE
Operation of D3-D with all-graphite walls
[DE94-004858] p 3886 N94-31304
The origin of neon-E: Neon-E in single interstellar silicon carbide and graphite grains p 3933 N94-31556
Stellar x ray polarimeter polarizer development and calibration at LEA/LLNL
[DE94-006400] p 3712 N94-31783
Occupied and unoccupied orbitals of C60 and C70
[DE94-008294] p 3873 N94-32755

GRAPHITE-EPOXY COMPOSITES
Atomic oxygen interaction at defect sights in protective coatings on polymers flown on LDEF p 3593 N94-31024
Assessment of impact damage in composite structures
[AD-A277063] p 3624 N94-32265
Comparison of the compressive strengths for stitched and toughened composite systems
[NASA-TM-109108] p 3627 N94-32939
Structural testing of the technology integration box beam p 3628 N94-33125

GRAPHS (CHARTS)
Selection of climate station data using clustering and triangulated irregular network techniques
[AD-A276658] p 3784 N94-32046
GRAFTED - GRAphical fault tree EDitor: A fault tree description program for target vulnerability/survivability analysis. User manual
[AD-A277067] p 3818 N94-32390

GRASSLANDS
Behavior and dynamics of tropical forests and savannas p 3757 N94-31004
Monitoring fertilizer application by imaging spectrometry (Somerset Levels test site) p 3745 N94-31863
ERS-1 SAR and optical data for land use/land cover mapping: A case study in a savannah zone of Guinea p 3755 N94-32565
Dry deposition of PAN to grassland vegetation
[DE94-005111] p 3768 N94-32894

GRATINGS (SPECTRA)
Observation of the traveling component of an x ray standing wave field
[DE94-007671] p 3672 N94-31317
Fast acting optical deflection
[AD-A276630] p 3879 N94-32037

GRAVITATION
Testing for preferred-frame effects in gravity with artificial Earth satellites
[PB94-148459] p 3610 N94-31771
New QCD results from string theory
[DE94-005226] p 3911 N94-31823
Defying gravity
[NASA-TM-109747] p 3667 N94-31884
World height system definition and implementation
[AD-A276725] p 3747 N94-32160

GRAVITATION THEORY
Testing for preferred-frame effects in gravity with artificial Earth satellites
[PB94-148459] p 3610 N94-31771
Research in theoretical high-energy physics
[DE94-008388] p 3876 N94-32407

GRAVITATIONAL COLLAPSE
Reactive flows in compact objects p 3934 N94-31567

GRAVITATIONAL EFFECTS
Numerical analysis of single-vortex/free-surface interaction
[AD-A276462] p 3701 N94-31241
General-relativistic celestial mechanics. 4: Theory of satellite motion
[PB94-147782] p 3601 N94-31769
Testing for preferred-frame effects in gravity with artificial Earth satellites
[PB94-148459] p 3610 N94-31771
Gravitational effects of cosmic strings
[ISBN-0-315-75484-2] p 3934 N94-31789
An experimental study of void formation during aluminum solidification in reduced gravity p 3667 N94-31944
Vibration Isolation Technology (VIT) ATD project
[NASA-TM-106496] p 3567 N94-33064

GRAVITATIONAL FIELDS
Topological conformal algebra in 2D gravity coupled to minimal matter
[DE94-008122] p 3910 N94-31052
Filtering of satellite altimetry data with optimal smoothing cubic splines to compute geoid heights, along-tract geoid and gravity gradients in the Indonesian waters and its surroundings
[PB94-147527] p 3741 N94-31074
Accretion disks around black holes p 3928 N94-31117
Research in theoretical high-energy physics
[DE94-008388] p 3876 N94-32407

GRAVITATIONAL WAVES
A study of angular momentum loss in binaries using the free Lagrange method p 3931 N94-31134

GRAVITY WAVES
On wave interactions of rotational and irrotational flows p 3700 N94-31219

GRAZING INCIDENCE
Dependence of x ray absorption magnetic circular dichroism on layer periodicity in iron-platinum multilayers
[DE94-008786] p 3647 N94-32892

GREASES
Silicone grease as a precursor to a pseudo crown-ether ligand: Crystal structure of (K(+)K(Me2SiO)7(+))(Hin(CH2CMe3)3(-))4)
[AD-A276343] p 3895 N94-31327
Status of developing a multifunctional aviation grease
[AD-A276755] p 3656 N94-32184
The preliminary evaluation of liquid lubricants for space applications by vacuum tribometry p 3606 N94-33313

GREAT PLAINS CORRIDOR (NORTH AMERICA)
Implementation of instruments and facilities at the SGP CART site
[DE94-006839] p 3781 N94-31322
Water vapor from sunradiometry in comparison with microwave and balloon-sonde measurements at the Southern Great Plains ARM Site
[DE94-007479] p 3786 N94-32759
Parameterizing atmosphere-land surface exchange for climate models with satellite data: A case study for the Southern Great Plains CART site
[DE94-005109] p 3775 N94-32874

GREEN'S FUNCTIONS
A Green's function approach to analysing the effects of random synaptic background activity in a model neural network
[MATHS-REPT-A-202] p 3828 N94-31157
Finite element solution to the Helmholtz equation with high wave number. Part 1: The h-version of the FEM
[AD-A277396] p 3848 N94-32341

GREENHOUSE EFFECT
The Earth's climate: Past, present, and future p 3777 N94-30982
Sources and wells of minor atmospheric constituents of climatic importance p 3770 N94-31008
Emissions of greenhouse gases from the use of transportation fuels and electricity
[DE94-006166] p 3765 N94-31625
Cumulus convection parameterization and numerical modelling of moist atmospheres p 3783 N94-31989
Carbon dioxide abatement as a differential game
[DE94-722023] p 3765 N94-32590
Fine resolution atmospheric sulfate model driven by operational meteorological data: Comparison with observations
[DE94-002994] p 3766 N94-32691
Diagnostic studies of climate variability
[DE94-003629] p 3767 N94-32711
Water vapor from sunradiometry in comparison with microwave and balloon-sonde measurements at the Southern Great Plains ARM Site
[DE94-007479] p 3786 N94-32759
National US public policy on global warming derived from optimization of energy use and environmental impact studies
[DE94-004606] p 3768 N94-32790

Quantified estimates of total GWPs for greenhouse gases taking into account tropospheric chemistry
[DE94-007846] p 3768 N94-32817
Ocean variability and its influence on the detectability of greenhouse warming signals
[DE94-008670] p 3790 N94-32881
A correlated k-distribution model of the heating rates for atmospheric mixtures of H2O, CO2, O3, CH4, and N2O in the 0-2500 cm(exp -1) wave number region at altitudes between 0 and 60 km
[DE94-005136] p 3775 N94-32895

GRID GENERATION (MATHEMATICS)
An adaptive finite element method for unsteady compressible rotor airfoil aerodynamics
p 3567 N94-31204
Grid sensitivity for aerodynamic optimization and flow analysis p 3568 N94-31287
Texture generation on irregular regions
[AD-A275999] p 3841 N94-31359
Cell-vertex discretisation of the driven cavity flow without artificial diffusion
[W-9317] p 3703 N94-31689
Polynomial interpolation and approximation of real functions. 2: Symmetrical interpolation for the triangle
[AD-A277345] p 3848 N94-32245
Eta percent-superconvergence in the interior of locally refined meshes of quadrilaterals: Superconvergence of the gradient in finite element solutions of Laplace's and Poisson's equations
[AD-A277242] p 3848 N94-32331
Additive turbulent decomposition of the incompressible and compressible Navier-Stokes equations
[AD-A277321] p 3708 N94-32511
New advances in the modeling of high-temperature superconductors
[DE94-007649] p 3905 N94-32815
Incremental triangulation by way of edge swapping and local optimization
[NASA-TM-103979] p 3709 N94-32946
Mesh optimization
[AD-A277644] p 3820 N94-32972
Transformation of two and three-dimensional regions by elliptic systems
[NASA-CR-195849] p 3821 N94-33049
Direct replacement of arbitrary grid-overlapping by non-structured grid
[NASA-TM-106601] p 3850 N94-33120

GRINDING (COMMINUTION)
On the formation of muon- and zets-phases in Ag-Al system by mechanical alloying
[DE94-007125] p 3845 N94-32836

GROOVES
Improved resealing procedures for the second deseal/reseal program in RAAF F111 aircraft fuel tanks
[AD-A277069] p 3580 N94-32378
Physics of heat pipe rewetting
[NASA-CR-195902] p 3913 N94-33148

GROUND CREWS
Aircraft communication and navigation systems and communication and navigation systems
[AD-A277309] p 3582 N94-32328

GROUND EFFECT (COMMUNICATIONS)
System analysis of ultra-wideband instrumentation radars: Impulse versus stepped-chirp approaches
[AD-A276624] p 3677 N94-32087

GROUND EFFECT MACHINES
Heave dynamics of an air cushion vehicle bag and finger skirt
[ISBN-0-315-87053-2] p 3568 N94-31734

GROUND STATE
Structural studies of photoinduced intramolecular electron transfer in cyclopentadienylnickelnitrosyl
[DE94-008467] p 3874 N94-32876
A quest for a new superconducting state
[DE94-008439] p 3908 N94-32991

GROUND SUPPORT EQUIPMENT
The 28th Aerospace Mechanisms Symposium
[NASA-CP-3260] p 3603 N94-33291

GROUND SUPPORT SYSTEMS
Development concept for Dutch user support
[PB94-125523] p 3598 N94-31208

GROUND TESTS
A large motion zero-gravity suspension system for experimental simulation of orbital construction and deployment
[NASA-CR-195881] p 3668 N94-33037

GROUND TRACKS
The effects of altimeter sampling characteristics: Some Geosat examples
[AD-A276899] p 3747 N94-32214

GROUND TRUTH
Ground based radiometric and atmospheric measurements p 3744 N94-31855
Feasibility evaluation of new data interpretation approaches for vegetation analysis from airborne imaging spectroscopy p 3745 N94-31862
Extraction of agricultural parameters from imaging-spectrometry data and simulated MERIS data through red edge analysis p 3745 N94-31865

GROUND WATER
Hydrologic Database user's manual
[DE94-003950] p 3743 N94-31603
Focused feasibility study final field sampling plan
[AD-A277445] p 3769 N94-33105
Temporal changes in the geographic distribution, elevation, and potential origin of the Martian outflow channels p 3951 N94-33235

GROUND WIND
Proceedings of the Ninth Annual Pacific Climate (PACLIM) Workshop
[DE94-003024] p 3766 N94-32693
Evolution of diurnal surface winds and surface currents for Monterey Bay
[AD-A277649] p 3790 N94-33057
Numerical simulation of thermally induced near-surface flows over Martian terrain p 3949 N94-33223
Polar sediment accumulation: Role of surface winds at the two poles p 3951 N94-33233

GROUP THEORY
Lambek calculus is L-complete
[LP-93-14] p 3841 N94-31388
A note on cocycles in a semidirect product
[REPT-93-65] p 3851 N94-31661
Multiparameter quantum groups and multiparameter R-matrices
